My Annual Catalogue of Vegetable and Flower Seed for 1881, rich in engravings from photographs of the originals, will be sent FREE to all who apply. My old customers need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed House in America, a large portion of which were grown on my five seed farms. *Full directions for cultivation on each package.* All seed *warranted to be both fresh and true to name*; so far that should it prove otherwise, *I will refill the orders gratis.* The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables. I invite the patronage of *all who are anxious to have their seed directly from the grower, fresh, true, and of the very best strain.*
NEW VEGETABLES A SPECIALTY.
JAMES J. H. GREGORY, Marblehead, Mass

WILBOR'S COMPOUND OF
PURE COD LIVER OIL AND LIME.

Wilbor's Cod-Liver Oil and Lime.—Persons who have been taking Cod-Liver Oil will be pleased to learn that Dr. Wilbor has succeeded, from directions of several professional gentlemen, in combining the pure Oil and Lime in such a manner that it is pleasant to the taste, and its effects in Lung complaints are truly wonderful. Very many persons whose cases were pronounced hopeless, and who had taken the clear Oil for a long time without marked effect, have been entirely cured by using this preparation. Be sure and get the genuine. Manufactured only by A. B. WILBOR, Chemist, Boston. Sold by all druggists.

The Herdsman.

OUR ANIMAL PORTRAITS.

Holstein Cow Lady of the Lake.

THE accompanying remarkable picture is an exceedingly accurate copy of a photograph of an imported Holstein cow, bred in North Holland and imported thence by Smiths & Powell in 1878. A person familiar with the distortions of photographs taken with instruments ill adapted to the purpose, and by "artists" who are no artists, but, on the contrary, poor artizans, might construct in his own mind an imperfect idea of what the cow is. He might suppose her to be well formed, her hind-quarters to be no larger than her fore-quarters in proportion, her head of a reasonably useful size, etc; but there is no fairness in an artist's doing this—certainly not if he be a conscientious man. How does he know that the hind-quarters are not really too small, and that the animal is not artfully posed in this way just to convey an idea that she is well proportioned? He cannot tell but that she has an enormous head, which by her position is thus greatly reduced in size. The artist who wishes to be fair has no option but to copy the photograph and leave to the photographer the responsibility for his own work. In this picture we have an extreme case. Whoever posed the cow, we suppose, wished to exhibit her excellent escutcheon, well-formed udder and fine tail. The photographer had not a suitable instrument, so the picture presents a horrible distortion.

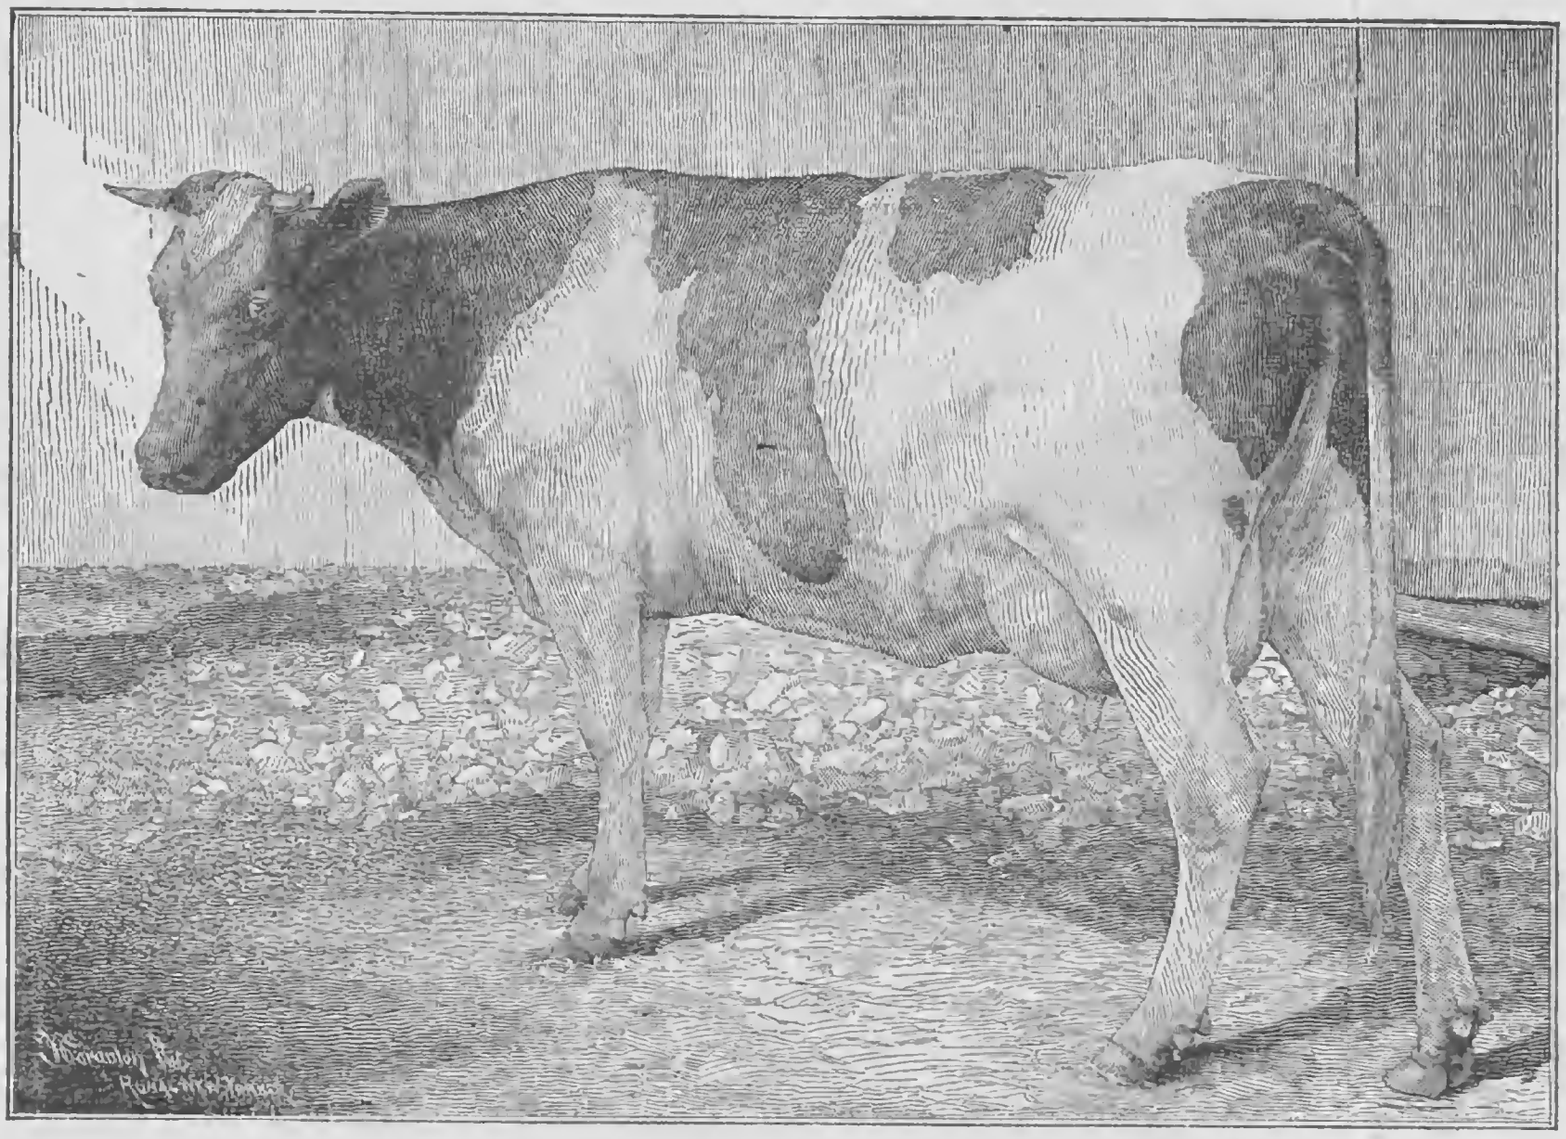
A proper instrument for taking animal photographs is quite an expensive one, but such may be had. However, a cheap common instrument may be made to answer well in this way:—The animal must be placed far away from the camera and against a strongly contrasting background, so that the figure will stand out clear and bright, and it is usually best to take the picture in strong sunlight, and the more nearly instantaneous in time the better. Such a picture will be very small, but should be clear and well defined so that it may be enlarged to any desired extent. The proportions will be more nearly accurate the farther away the object is.

One of the best distant positions in which an animal can be placed is on the sill of a barn-door, the doors, of course, being open, the sun shining full upon the object, and the interior of the barn proving a nearly black background. In this case the photographer places his instrument at a hight, if possible, somewhat above the object and as far in front of the barn as he can get a picture that will bear enlarging. The artists who make cattle portraits a business, and require a photograph only to give an idea of the animal's markings and the general look of the head and horns, have really an ideal frame over which they hang the skin of one cow one day and of another the next. What are such "portraits" worth but condemnation?

One of these cattle drawers once told in our hearing how that he was applied to, to draw a picture of a pair of Chester County pigs. His charge for traveling some 200 miles and making sketches was too much for the owner who pleaded for some sketch which he could afford to pay for. So Mr. ——— went to his own orchard and made an accurate sketch of a fine Suffolk sow he had there; then, coming to the house, he copied this sketch on the same paper, turning it about, making certain additions and giving a slightly heavier head, and sent the picture off as a pair of Chester Whites, male and female. They gave excellent satisfaction and served in the public prints as portraits of particular pigs of a rather famous breeder, carrying about with them the well-known initials of the "artist" as evidence of their correctness.

The substitution of the picture of one animal for another, and continuing its use after the animal for which it was taken has been made beef of, is no more clearly a fraud upon the public than is this method of working up a picture to suit breeders' wishes rather than the facts, and picturing what the breeder thinks the animal ought to look like, rather than the beast itself. Give us a good photograph and the pictures will be portraits, and will fairly show the animals, with "nothing extenuated and naught set down in malice."

THE Holstein heifer "Lady of the Lake" calved March 30th, 1878. She was imported and is owned by Smiths and Powell, "Lakeside Stock Farm," Syracuse, N. Y. She has just closed her two-year-old milk record which is as follows: She dropped her first calf at 22½ months of age, and before she was two years old gave 45 pounds 13 ounces of milk in one day, and 1,284 pounds nine ounces in one month. As a two-year-old she gave 1,344 pounds 11 ounces in a month, 7,056 pounds 12 ounces in six months, and 12,200 pounds four ounces in the year. With one exception (Netherland Queen of the same herd), this is largest two-year-old record ever published. Netherland Queen gave as a two-year-old 58 pounds 12 ounces in a day; 1670 pounds nine ounces in one month, and, 13,574 pounds three ounces in one year. This firm have the two largest records for mature cows ever published, Aaggie, six years old, gave in one day 84 pounds 12 ounces, 2,362 pounds two ounces in one month: 10,692 pounds six ounces in six months and 18,004 pounds 15 ounces in one year. Aegis, six years old, gave 82 pounds 12 ounces in one day; 2,289 pounds nine ounces in one month; 10 904 pounds five ounces in six months, and 16,823 pounds 10 ounces in one year.



HOLSTEIN COW, LADY OF THE LAKE.—From a Photograph.—Fig. 189.

IN-AND-IN BREEDING.

Mr. Talcott's Answer to "Stockman."

HUMAN nature is very weak, and in many instances very "precarious." "Stockman" says in the RURAL NEW-YORKER of February 19th. "Mr. Talcott does me great injustice when in his communication, (page 84), he says my replies are shifts to avoid a direct answer in one way or another." Had "Stockman" quoted what I wrote and was printed on page 84, I should have said nothing more about it. After stating my object in asking him to give the number of animals of the Bates Duchess family now in existence, so that farmers might judge of the theory of in-and-in breeding as advocated by him, I said:—"Either through ignorance or prejudice on my part, I can look at his replies in no other light than as shifts to avoid a direct answer in one way or another." It has seemed to me that "Stockman" has not wished, nor does he now wish, to discuss this question of in-and-in breeding, but merely to throw down the gauntlet of in-and-in breeding as a great bugbear that no one dares to contend against; and he refers to Mr. Thomas Bates to show what a furore there has been with regard to his so-called families of cattle, and especially the Duchesses, to prove that in-and-in breeding must be the true system of breeding. I have never written a line for the sake of contention, and never intend to, yet I have my views and opinions from actual experience, and when I have learned a valuable lesson from that source, it will take more than a bare assertion from others to convince me of error; but when actual demonstration has shown me that I may be in error, or that others may have as good evidence of right by other processes, I think I can be as easily convinced of such facts as most persons.

"Stockman" in his replies to my question, ("If in-and-in breeding is so successful, where are the descendants and how many are they, of Duchess of 1804, and Duchess of 1810 at this date?") has virtually acknowledged that their breeding has not been a success in the manner they have been bred. He says: "The reason why Mr. Bates left so few at his death is that that gentleman bred his Short-horns for reputation; it was a passion of his, and he gave his life and work to it. Desirous of proving the wisdom of his method, he doubtless, as many other breeders have done and do, fed and slaughtered every animal that did not come up to his ideal. That he would sell any inferior animal is not to be supposed for a moment or that he would keep one for breeding."

Now, if the above be true with regard to Mr. Bates's manner of breeding, when he asserted he had the best cow in England in Duchess of 1810, and he had and used the best bulls in England, as he also asserted, was it not rather poor encouragement to the breeders of Short-horns of that day? It seems to me that there were too many culls, or too many barren animals to be successful with such material as Mr. Bates began with. If so many animals from such stock were inferior and not fit to breed from, what could be expected from the ordinary Short-horns of that period? I am fully convinced that what is termed in-and-in breeding, as practiced by Mr. Bates, did deteriorate his cattle, and the continued practice has sadly interfered with their health and hardihood since his death. It is very evident that the Booth cross in Lord George (10,439) on the Airdrie branch of the Duchess family, did increase their hardihood and breeding properties, which shows that in-and-in, or extremely close-breeding, was not as successful in the long run as an outcross. The failure of the Duchess family, also alluded to in my letter published in RURAL NEW-YORKER of February 5th, where so many of them had died and failed to breed, is a strong argument with regard to the evil effects of too long-continued close-breeding.

"Stockman" may, if he wishes, take the so-called Oxford family and see how much consolation he can get from their present numbers in this country. I would like to know why Mr. Bates's Duchess 34th, and Duke of Northumberland (1,940) were so much superior to those previously bred, if it was not owing to the infusion of new blood by the use of Belvedere

(1,706), and if it was, then what becomes of the theory of in-and-in breeding? By the use of Belvedere, Mr. Bates has shown to the world that other Short-horn breeders of his day had as good cattle as he had. By the use of this bull he also proved that he did improve his herd, thus showing that he was too strong in his prejudice against the cattle of other breeders. The improvement made by this outcross and the fact that the Matchem Cow, the ancestress of the so-called Oxford family of Mr. Bates, which has been ranked second to the Duchess, had a strong infusion of Mason blood in her veins, which blood Mr. Bates had previously condemned, prove most conclusively to my mind that Mr. Bates's cattle were not better than those other breeders had in his day. In fact, he selected his animals to start with from what he no doubt considered the best herds, and the best specimens in such herds, and after breeding for some time and without that success that he wished, he was forced to go outside of his herd (although it must have galled him to do so, after his sweeping denunciations of the cattle of other breeders), or his herd must have utterly failed. Mr. Stephenson must have felt proud to have sold Belvedere to Mr. Bates, as it was a tacit assent on the part of the latter that Mr. Stephenson had a better bull than he had, which was no doubt the fact, as his "get" so plainly proved. Should not Mr. C. Collings have the honor of originating the Duchess family, and Mr. Stephenson the honor of furnishing Mr. Bates a bull that did more to bring that family of Short-horns into repute than any bull Mr. Bates ever bred? Also, should not Mr. Mason have the honor of furnishing from stock of his breeding the Matchem Cow which produced the so-called Oxford family in the hands of Mr. Bates? It seems to me that to these men equal honor is due with Mr. Bates, if they get their proper meed of praise in regard to these families of Short-horns.

In regard to Mr. Bakewell's sheep breeding, he could for years breed without going outside his own flock and not breed very close, owing to the large number of ewes in the flock. And then what of the black tup found on his premises? Did not Mr. Bakewell get some new outcross from that source? It has often been shown that such a thing was possible, and even probable. Does the single instance of Goldsmith Maid prove that in-and-in breeding is a success? How many of the trotting-bred horses are a success, even as farm horses or roadsters? In other words, how many are failures to all intents and purposes, as has been plainly shown by the prices they have sold for during the past few years, when from overstocking breeders have sold the surplus? I could point to sales where the animals sold did not bring the money paid for the service of their sires—could that be called a success? "Stockman" knows full well that in a case like Goldsmith Maid's, it will do to publish the success, but what breeder of cattle or horses would be willing to have the failures made public, and no one should do that with his neighbor's property without his consent.

"Stockman" says I have no right to pick out the Duchesses as examples of what I consider injurious breeding. That is a strange assertion it seems to me. If in-and-in breeding is the true course, then the more in-bred the better, I should think. I did think I had the right to ask the question and also that I had the right to pick out the Duchesses if I chose. If I had no such right, then it is an error of judgment on my part, as I did not intend to do what I had no right to do. I leave the readers of the RURAL to judge in this matter, and will abide by their decision. Stockman says. "The history of the best and most successful stock-breeding is full of such examples, and yet Mr. Talcott finds fault with me for complaining that the great bugbear of farmers is close breeding—it is only because they are uninformed of the facts. But Mr. Talcott is informed and therefore if he sins at all it is against light." The above sentence I suppose Stockman thinks is unanswerable; but I would most respectfully ask him or any other person: Did not the introduction of Belvedere (1706) into Mr. Bates's herd make in it the greatest improvement made by any bull he ever used? Did not the Matchem Cow in her first crossings with Mr. Bates's Duke bulls produce healthier and more prolific animals than the Oxfords of the present day? If so, what becomes of the theory or practice of in-and-in breeding? In regard to examples, I will state that nearly 40 years since I saw in the yard of the late Francis Rotch one of the most miserable specimens of Short-horn cows that I ever beheld, which Mr. Rotch said was the progeny of a bull on his own mother, and he called my attention specially to that fact, as one of the results of in-and-in breeding. I also have frequently seen such results in other herds, and in my own I have in a good many instances had results as disastrous, but I never knew any harm to come from an infusion of fresh blood in any herd. That there have been fine animals bred by in-and-in breeding I have no doubt; but such are not the invariable rule, but rather exceptions to a general rule, while with fresh blood of equal merit a poor animal is the exception and not the rule resulting from such breeding. J. TALCOTT

CALVES SUCKING THEMSELVES.—A correspondent writes us from Albion, Michigan, that he found a complete remedy for this habit in the liberal application of Cayenne pepper two or three times to the parts sucked. No evil effects resulted either to the sucker or sucked.

Another correspondent writes from Peekskill, N. Y., that the use of common pine tar (applied we suppose, to the part usually sucked) will prevent the habit.

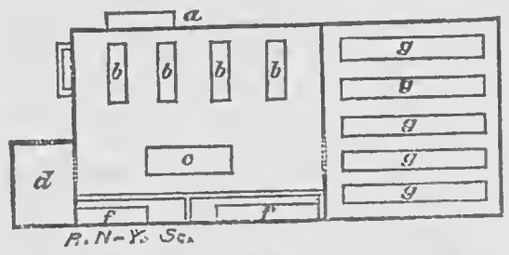
Dairy Husbandry.

THE DAIRY COW—NO. 29.

HENRY STEWART.

Cheese Factories.

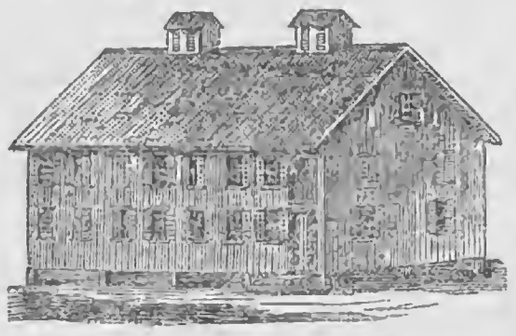
THE cheese factory is nothing more than an association of dairymen by which one set of apparatus and one skilled person are employed to do the work of several. It is thus a system of economizing labor and capital by association. It has lightened the labors of thousands of farmers and their families and has vastly enlarged the development of the dairy interest. There are two methods of managing the business of a cheese factory; one is by purchasing the milk outright from the farmers at a stated price and another by making the cheese on a co-operative principle and distributing the proceeds, *pro rata*, according to the quantity of milk delivered by each member, after a certain fixed charge has been made for manufacturing. This charge is usually two cents per pound of manufactured cheese. The method, however, of organizing the business is immaterial; it is the management that is more pertinent to us at the present.



GROUND PLAN OF CHEESE FACTORY—FIG. 190.

A cheese factory consists of a building adapted to the requirements of the machinery used in the manufacture, for the proper reception of the milk, and for the curing of the cheese. It is provided with a steam boiler for heating purposes, a curing room for storing the cheese and apartments for the manager. It should be constructed in such a manner as to maintain an equal and steady temperature with economical consumption of fuel and be connected with effective drainage by which the refuse whey may be carried off to a safe distance. A frame building with an eight or ten-inch air-space between the inner and outer walls and protected by air-proof lining, answers every desirable purpose. The ground floor should be amply spacious, and a two-story building with curing room above is the cheapest. As an even temperature and a stable condition of moisture and good ventilation are required, it would seem that a basement curing room would be preferable to any other. It would certainly provide every requisite in a more certain manner than an upper floor would, and yet I have not yet heard of a curing room so arranged in this country. Curing cellars are common in England and in France, and it is difficult to see why an airy, well lighted, well drained basement of brick or stone should not be infinitely preferable to an upper floor heated by the Summer sun to an injurious degree and difficult to cool at certain seasons.

The factory site should be on high, airy, well-drained ground. A permanent supply of water sufficient to fill a two-inch pipe is needed for a factory of 500 cows. A building of this capacity should be 75 feet long by 32 feet wide and the floor should be nine feet in the clear. If the curing room is in the basement, a story-and-a-half building only will be needed. The frame should be substantial; the lower floor of matched hard pine plank, slopes three inches from front to rear, where a trapped drain is made to convey away all the slop and whey and the washing of the floor. The whole interior should be double plastered. The upper floor should be matched and tight, and to avoid pillars in the lower room the beams should be supported by iron rods attached to collar beams in the roof. An ice chamber, or, which is far better, one of the ice and cold-air machines now made and to be procured for a moderate sum, is needed to control the Summer temperature. The most ample arrangements for thorough ventilation are indispensable. A modern factory for 500 to 600 cows, is supplied with the following apparatus: two 600-gallon vats, or more smaller ones; a five-horse power boiler; two gang cheese presses; 20 self-bandaging hoops; one 600-pound platform scale; a 70-gallon receiving can; a hoisting crane; a tin milk conductor; a set of curd knives to cut perpendicularly and horizontally; a curd mill; cheese scale and other small utensils. The whole cost of these amounts to a little over $700.



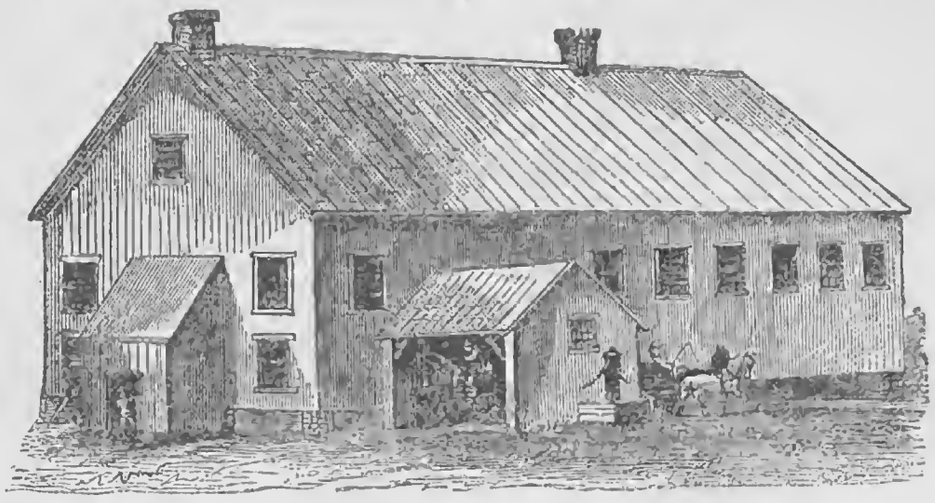
CHEESE FACTORY UNDER ONE ROOF—FIG. 192.

The space on the lower floor required for manufacturing will be about 40 feet in length. This is separated from the rest of the building by a close double partition having a large sliding door in the center or otherwise placed, as may be found convenient for the removal of cheese from the press to the curing room, for which this space is set apart. A convenient arrangement is as shown at Fig. 190.

At *a*, is a covered drive-way for unloading, with a platform for receiving and weighing the milk. The milk is then conducted by means of the milk conductor to the vats, *b*, *b*, *b*, *b*, here represented as 300-gallon ones, and four in number. The curd sink is at *c*; the boiler house at *a*; the presses at *f*, and the cheese tables at *g g*, *g*, in the curing room. The drain is shown by the double lines.

The curing room is furnished with benches, 24 inches high and three feet wide, made of strips having spaces between them to facilitate circulation of air. These benches should be carefully made to avoid cracks or spaces in the joints which would harbor cheese maggots, the great pest of the cheese factory. They should be ranged at a distance of two feet apart and the cheeses are placed on them in double rows. A roomy closet should be provided in which to keep the numerous small utensils and for a wash-stand and towels for the men. The factory is best warmed by steam coils supplied from the boiler, and a small engine of two-horse power at least will do all the hoisting, pumping, or forcing water for washing, and grinding the curd. The upper curing room, or the basement if that is used, is furnished in the manner described and an elevator for moving the cheese will be found very convenient. A sliding trough will also serve to pass the cheese from the upper to the lower floor.

The style of building for a factory may be varied to suit the taste or ambition of the owners. Fancy-work pays nothing, and plainness and substantial work and material only are required for economy and for use. The engraving, Fig. 191 represents a well arranged factory in Northern Vermont in which the whole is under one roof. In some factories the curing and store-houses are made separately, with every appliance for coolness, such as shutters and ventilators; double walls; and an open space under the building. A separate curing house belonging to a well-known New York factory is shown at Fig. 191. These buildings are plain but sufficient for every purpose.



CHEESE FACTORY WITH DETACHED PARTS—FIG. 191.

LARD-CHEESE.

WE no sooner become resigned to "oleomargarine" than this invention of more recent date meets our gaze. It has even become stale to say, What next? Lard-cheese is a mixture of lard and cheese in the proportion of three pounds of sweet milk to one pound of lard. The two ingredients are mixed together by running them through a machine which revolves at the rate of about 4,000 revolutions per minute. The machine consists of a revolving cylinder within a stationary one, and is two feet high and eight inches in diameter. The inside is set all over with about 4,000 sharp teeth, which just clear the outside cylinder when they revolve. The lard and milk after being mixed are called cream. Three pounds of this cream are mixed by hand with 100 pounds of sweet skimmed milk; the cheese is then made just as other cheese.

The butter is taken out of the milk—four pounds of butter to 100 pounds of milk—and about a pound and a half of lard substituted for it. The butter in cheese hastens decay, while lard may be shipped around the world.

This cheese stands the heat better than any other kind, and will therefore be apt to find a ready market in the South. No taste or smell of lard is perceptible; it is a great improvement on skim-milk cheese, and contains nothing deleterious to the health. The cheese is, in fact, first-class, although it does not sell quite as high as milk-cheese.

The cylinder which I have described costs about $300. The parties who own the patent put in all the machinery—that is, boiler, engine, etc.—which costs about $5,000, and charge .00½ cent. per pound on all cheese made. The cheese is branded "Lard-cheese," and if so branded I see no reason why it should not find a ready market, and the making of it become a profitable and honorable industry.

PROFESSOR I. P. ROBERTS.

Field Crops.

POTATOES CUT TO SINGLE EYES.

A Question of Spaces.

CONRAD WILSON.

THIS inquiry is clearly presented and very fairly tested in an experiment recently reported from the Rural Farm. Some of the features and results of that trial, though not apparently very striking, are too important to be lightly dismissed. Though the yield was not large, in consequence of an unusually poor season, I think it will be found, when all the factors are examined and compared, that the trial was by no means unfruitful, and that some of the results developed are well worth the time and labor invested.

On comparing the various products (but omitting such as were injured by moles), it appears that in the two poorest rows the average number of pieces was 35, and the average product 20½ pounds, making the yield per acre equivalent to 150 bushels. It will also be seen that in the best row the number of pieces was 66, with a yield of 31¼ pounds, making the rate per acre 225 bushels. Taking the average rate per acre for all the rows together, we find it equal to 184 bushels, with 50 pieces in each row, and for the five best rows 209 bushels per acre, with an average of 64 pieces per row.

Now to show in what way, and to what extent the spaces in planting affect the yield, we have the following instructive figures.

	bush. per acre.
35 pieces per row represent a yield of about	150
50 " to each row " " "	184
64 " per row " " "	209
66 " " " " "	225

In other words,

The distance apart for	150	bu. per acre was nearly				12	in.
"	"	"	184	"	"	8	"
"	"	"	209	"	"	7	"
"	"	"	225	"	"	just 6	"

In another view also, this result is further confirmed; for if we take the closest planting above given (which is six inches in the rows), it shows an area of 2.6 square inches for each single eye, which is space enough for a much larger yield than either of the above.

But again, there is another comparison to be made in this connection. An adjoining plot of the same area as the above was planted with the White Elephant variety, and the yield was at the rate of 280 bushels per acre. In this second plot the distance in the rows was 22 inches, while the other conditions were similar to those of the first plot.

Now if this variety had been planted at the same distance in the rows as the average of the previous plot (which was about eight inches,) the yield would have been, according to the law above indicated, over 400 bushels per acre, and in a good season, probably five or six hundred bushels; for it is evident, from the above comparative test, that the White Elephant is much more prolific than the Beauty of Hebron.

If now we take the average product of the two plots together, it shows a yield for the entire experiment equal to more than two hundred bushels per acre, which must be admitted

a very fair result for a season so unpropitious and when so many potato crops in New Jersey and on Long Island were entirely cut off by an early and severe drought. Had the season for this trial been free from conditions so unusually disastrous, the total result for both varieties would doubtless have been much larger.

I hope the editor will test the White Elephant this year at eight inches apart in the rows. The following

Recent Examples

of success in potato culture may well encourage the field trials of the coming year.

With a yield of only 208 bushels per acre, Joseph Harris reported the cost at 16 cents per bushel, and the profit per acre at $87, and in another case, with a yield of 300 bushels, he found the cost to be nine cents, and the profit per acre, $123.

Fred. T. Burnham of Massachusetts, reported to the Essex Agricultural Society, a result from two-thirds of an acre showing a yield equal to 320 bushels per acre, with a profit of $120.

At a potato trial in Vermont, of 355 competitors (all of them under 17 years), the premium crop was 422 bushels, by Lewis S. Reed of Goshen.

Now if the *White Elephant* is tested under thorough conditions the coming year, there is good reason to believe that a rate of yield equal to four or five hundred bushels per acre will be the result.

TOBACCO CULTURE.—NO. 6.

G. A. GOFF, JR.

"Suckering."

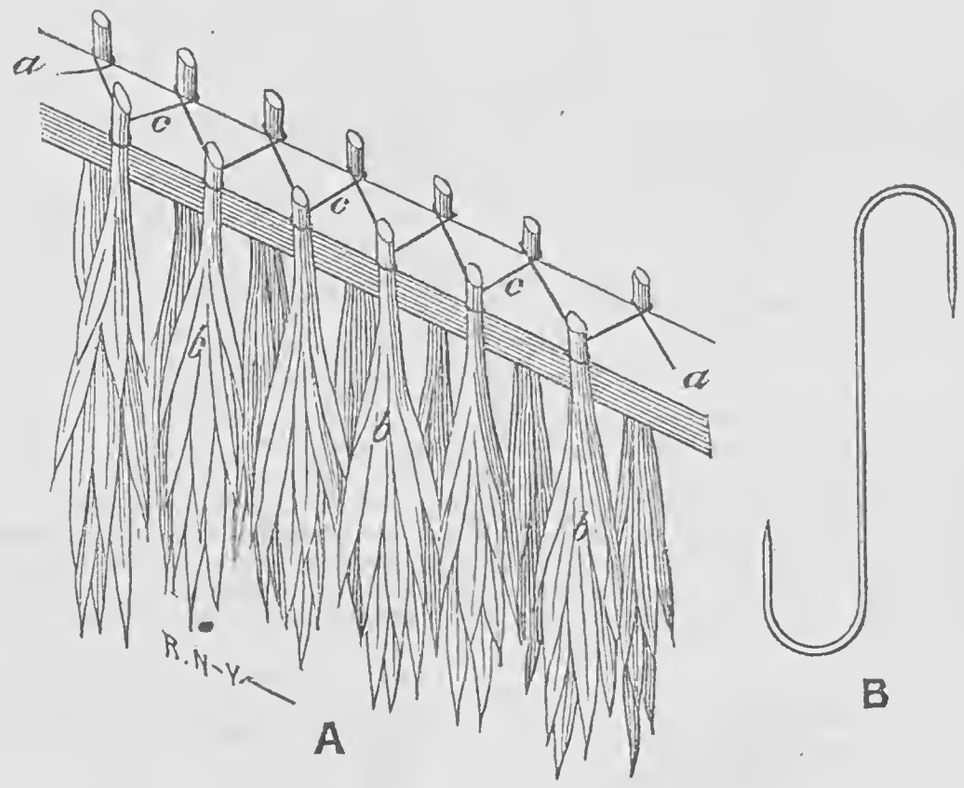
AFTER a tobacco plant is "topped," sprouts or "suckers" immediately start out at the axils of the leaves. The work of breaking these off is termed "suckering." It is important that the work should be done well, or the growing suckers will rob the plant of much of its vitality, and hence injure the quality and yield of the crop. Two suckerings are usually necessary—the first in two or three days after the plants are topped, and the second shortly before the time for harvesting the crop. If suckers are allowed to remain on the plants when they are harvested, they will damage the leaves during the process of curing. Suckering tobacco is very laborious work, as it necessitates much stooping, on which account boys are better fitted for the work, and being smaller are less liable to break off leaves in the operation. They must be watched, however, or the work will be slighted.

Harvesting the Crop.

Experience and judgment are necessary to determine when tobacco is fit to cut. The leaf assumes a peculiar quality, which is well understood by every experienced cultivator, but is difficult to describe. When ripe the leaves become spotted and the lower ones turn brown. About two weeks are usually required for tobacco to ripen after it has been topped.

The plants are cut with a hatchet and carefully laid upon the ground for a few hours to wilt, but they must not be long exposed to a hot sun. Great care should be taken to handle the plants carefully, so as not to break or tear the leaves. Careful hands should be secured if possible, and they should be instructed to handle the plants with great care at all times, for great damage sometimes results from the careless handling of tobacco. The cutting should be done principally in the early and later part of the day in order to prevent sun-burning, which will surely occur to tobacco exposed to a hot sun in the middle of the day. It is not safe to leave tobacco upon the ground between the hours of ten in the morning and three in the afternoon on a hot day. Only as much should be cut down, therefore, in the morning as can be removed to the curing barn by ten o'clock, when, if the sun shines hot, the cutting must be suspended until two or three o'clock in the afternoon.

When sufficiently wilted to admit of handling without injuring the leaves, the plants are loaded upon a wagon and drawn to the curing barn where they are hung up to cure. The rigging used for drawing the tobacco to the barn consists of a smooth platform 16 feet long and five feet wide, fitted to a wagon. The plants are loaded upon the rigging carefully, with the butt ends kept even, in a rank not more than two feet high. If loaded too high the tobacco will be bruised in drawing it to the barn. In loading it is important to begin at one end of the rigging and load the proper height from bottom to top, thus working towards the other end. Thus, if the loader commences to load his rigging from the front end he should complete his load as he passes to the back end, so that when he has reached that end his load will be done. This prevents the plants from binding while they are being taken from the rigging, provided they are taken off from the end opposite that at which



HANGING TOBACCO.—FIG. 193.

they were loaded—which should always be done.

If the tobacco barn is situated a considerable way from the field, so that the tobacco must be drawn quite a distance, an old carpet should be tacked to the bottom of the rigging to prevent the plants lying next to it from being bruised.

Green tobacco is extremely tender, and rough handling should always be avoided, as a leaf torn or bruised is injured in quality as a wrapper. The tobacco is usually hung upon poles with twine, which is made for the purpose. The manner in which the plants are hung is best shown by the cut A, Fig. 193. *a* is the pole to which the plants are hung; *b*, *b*, *b* show the plants as hung; *c*, *c*, *c*, the twine as it crosses over the pole. This is the common method of hanging tobacco, and the one practised by most of our growers. A new method, however, is being adopted by some which is undoubtedly preferable to the one above described.

In this plan the plants are suspended to the poles by wire hooks made of common wire but somewhat in the form of a letter S, as shown in cut B, Fig. 193. One end of the hook is driven into the butt end of the plant by a boy who follows the cutter. The plants are hung upon laths by the hooks, from six to eight plants being hung to a lath. These laths are suspended in the curing barn upon cross joists which support the ends of the laths, leaving the plants hanging between. When this method of hanging tobacco is employed a different rigging is used for drawing the tobacco to the curing barns. It consists of a frame about four feet wide and five feet high and twelve or sixteen feet long. Upon this the laths are placed crosswise and upon them the tobacco handed up from the ground is hung as above described.

This method of handling tobacco has the following advantages: 1st, the plants hung thus in the field and carried in a perpendicular position to the curing barn suffer less damage from the bruising, breaking or tearing of the leaves than when thrown flatwise upon a platform rigging. 2nd. Being hung in the field and drawn in a hanging position, tobacco may be handled without being much wilted, and hence harvesting can be carried on in wet or cloudy weather. 3d. Tobacco hung upon laths requires less handling of individual plants while being suspended in the curing barn, and hence less damage is suffered by the leaves.

POTATOES.

THE MAMMOTH PEARL seems this season to be offered among the novelties of all large seedsmen, who speak of it in high terms. The skin and flesh are white. It is said to have been selected as the best of over 2,500 seedlings, which, if true, must have required the services of several persons several years to determine. In shape it is roundish, with few eyes, and those not sunken. Its productiveness is said to be something remarkable.

THE ST. PATRICK is said by several, who seem to have compared the two supposed kinds, to be identical with the Burbank. But as to parentage, the St. Patrick is stated positively to be the result of a cross between the Garnet Chili and Early Rose. Hence, though they may resemble each other closely, probably a further trial will show they are not the same. The St. Patrick has been tested in England and is well liked. The present season it is offered in Daniels's Illustrated Guide (Norwich, England), from which our engraving is reproduced, at one dollar per peck, while it is now offered here by Mr. Henderson, the introducer, at $1 25 per peck.

PRIDE OF AMERICA.—This was raised by E. S. Browneli, and closely resembles the Snowflake, ripening a few days earlier. It is said, however, to be more productive, to grow to a larger size, and to be adapted to a greater range of soils. It is a white variety, and is now offered for the second season.

MANHATTAN.—This has been tried for the past 10 years we believe. It has a purple skin, is productive, but of medium quality only. We tested it two years ago.

CHOOSING SEED CORN, ETC.

GEN. WM. H. NOBLE, BRIDGEPORT, CONN.

CHOICE seed and better culture should go hand in hand. Enrichment and tillage have much to do with the quality and swell of our corn crop; but senseful and careful choice of seed would grow to an equal factor in footing up its bushels. In truth, I think that in the near future better choice is the great hope of this grand staple. We have trusted too much to manure, or to nature's enrichment, or the deep virgin soil of the vast West; but seed choice and better kinds have been little tried or studied.

Now God fashioned the corn-stalk ready for man to grow an ear at every joint; yet the average farmer is blind to the chance and holds to the old ruts. His choice of seed begins and ends at picking from the corn-bin the longest and heaviest grain-weighted ears. Even with this half-wit in its business, the harvest piles the corn-cribs. No crop fills the eye with so grand a sight and sense of plenty. In the dearth of food abroad, its troop of *fixings* yearly gains it better relish on the palate of the world and a stronger foothold in its grain marts. Diplomacy might help in this. We make foreign ministers, attachés and consuls out of a little literature and a great deal of politics: suppose we foster commerce in Indian corn by making diplomats out of first-class adepts in all the toothsome viands of which Indian corn is master.

But the business of corn-growing wants brains plowed under and planted right alongside its buried food. Well-studied, skillful trial and method, put at the service of the plants' root-growth and seeding, will pay well. The choice and care put into other business will prove in this better helps than whole barnyards turned under, or heavy doses of special manures. Yet spare not your enrichment! If this year's crop does not eat up its substance, the next will render you account of its service. At the same time let every corn-raiser study the plant's ways and post himself on what others have found out.

I give my own little record, and, years before the war, I largely furnished Thorburn & Co. and others with sweet seed corn and yellow eight-rowed New England. My method in field work was, heavy manuring, level culture and low-down-earing stalks. As soon as the crop matured I had every stalk with two or more ears cut up and looped two and two and hung on nails or poles in the corn-crib. When fit for shelling, a second choice was made from stalks bearing the most and best ears. Seed from these was carefully kept for my next planting. Under this plan, year by year, the quantity and quality of the crop made great gain. I soon found plenty of stalks with three good ears. But business down in Dixie broke up my corn crop, as well as other things, and I have never renewed the culture.

I call especial note to the need of gathering the seeds and stalks together. You can rarely trust a farm-hand to pick to basket from your two or more eared stalks. It requires a watchfulness and denial of a full basket to which he is not equal; but he cannot well shirk or blunder in the choice of two-eared *stalks*. Nor will the average "hand" stop even to choose closely the best ears from the stalks in cribs; this work you should do yourself of a rainy day or at some leisure.

Corn Culture.

I would like to say a few words about the culture of corn, which may be of benefit to some. After thoroughly fitting the ground, I put in the seed with a grain drill, one peck to the acre, in drills 40 inches apart, using 200 pounds of phosphate to the acre; then, before the corn is up, if the weeds have started, I harrow it thoroughly with the Thomas Smoothing Harrow, which will kill all the weeds and not injure the corn. I use the harrow as often as is necessary to kill the weeds till the corn gets too large; then the cultivator and hoe have to do the rest. Thin to 12 inches. The harrow saves me much time, as I can keep the start of the weeds, which is hard to do if one has to wait for the corn to get large enough for the cultivator.

Oneida Co., N. Y. S. G. S.

Sweet-scented Vernal Grass — Anthoxanthum odoratum.

This is another small grass, possessing considerable merit on account of some of its peculiarities. As the stems are quite short, only a light crop can be cut for hay—in the words of Mr. Gould, "not over three-quarters of a ton from an acre." The grass starts very early and flowers early in the season. It is not a favorite with any kind of stock, though often recommended for pastures on account of its earliness. The stems and tops are the most offensive to stock. It is very fragrant, especially after wilting, giving an odor which is much admired. This is one of the reasons why it is so often recommended for lawns. T. M., in the Treasury of Botany, says:—"The fragrant resinous principle which occurs in this grass, and is called *coumarin*, is a widely diffused natural perfume, being found in the Tonka Bean, the Faham Tea-plant of the Mauritius, the common Sweet Wood-ruff, the common Melilot, and the Blue or Swiss Melilot." The grass is a native of Europe, and is extensively naturalized in North America. It likes rich, moist soil and cool Summers. In the northern part of Michigan, and perhaps in other places, the Indians raise this grass and use the stems for mats, card baskets and other small articles for the sitting-room. The delightful odor remains with the grass for a long time after it is cured and used in this way.

PROFESSOR W. J. BEAL.

Farm Economy.

PASTURING GRAIN FIELDS.

As a rule here the farmers have their land fenced into small lots so as to be able as much as possible to pasture as soon as the crop is taken off the fields. In Summer, wheat and oat fields are pastured and in Winter, corn fields, as soon as the corn is gathered. This year considerable loss has been sustained by farmers who, on account of bad weather, were unable to gather their corn in season to obtain the benefit of allowing their stock to have the run of the corn fields, or, where they had not sufficient stock of their own, to rent out their corn fields to others. And at this late date on account of the scarcity of feed caused by the short crop and very long Winter, farmers are renting their corn fields to stock-men. This course is a serious question of profit with many, as it is very doubtful whether the amount received for the corn-stalks will pay for the damage to the land by tramping by large droves of cattle when it is so wet.

This damage is no inconsiderable one when it is beyond question that where the land is muddy and stock is allowed to tramp over it, as they are certain to do when turned in to live on the stalks and corn that is left, the land and crops will feel the effects of such treatment for two or three years. I believe it a "penny-wise-and-pound-foolish" policy that induces farmers to allow it. It does not seem to injure land to pasture it late in the Fall or during the first part of Winter, but very few of our best farmers care, as a rule, to have their fields pastured after New Year's, unless it is so cold that the ground does not thaw out any during the day-time. But as this year seems to be an uncommonly hard one, and as fodder is getting very scarce, a number of farmers have allowed their fields to be pastured later than usual; in fact, many of them now have droves of cattle in their corn fields clearing up the stalks although the recent rains and snows have made the fields nearly knee-deep in mud. This kind of tramping will seriously injure the cultivation of the land the present Spring and its ill effects will be visible for two or three years more.

Miller Co., Mo. N. J. SHEPHERD.

Deaconed Calves as a Fertilizer.

IN disposing of "deaconed"—calves I first procure a large crockery cask, one tight enough to hold ashes. I then put in a layer of ashes and then a layer of "deacon" cut in pieces so as to pack closely, and keep on in this way, every alternate layer being of good wood ashes. Let the cask stand uncovered so that the rains can keep it moist. The ashes will dissolve meat and bones, rendering the whole one of the best fertilizers for any crop in the Spring following. I often wonder why men who call themselves farmers let so valuable a matter go to waste and breed flies and vermin, while they themselves breathe the bad air that fills their barn yards.

I once applied some of the above-described fertilizer to a plot of rutabaga turnips and they yielded at the rate of 800 bushels per acre. Another good way to dispose of "deaconed" calves is to dress them and put them in a common feed steamer and cook them, and then feed them to fowls. After the fowls have taken all the meat off the bones, take the bones and pound them fine, so that the fowls can eat them, and then you may begin to look for eggs, for this food will not fail to make them lay. ISAAC PEASLEE.

Schoharie Co., N. Y.

The Vineyard.

GRAFTING THE GRAPE—CAUTION.

DISAPPOINTMENT has been the lot of not a few planters who yielded to the peach craze of the last few years; but, while we deplore the circumstances which have been unfavorable, there is reason to fear that the grape fever, now so prevalent, will ultimately be attended by a like want of success for lack of intelligent choice from the many new candidates for public favor. To write a long discussion of the merits of this variety or that would, or should, lead the editor to consign my paper to the waste basket, inasmuch as almost every writer, as the saying goes, "has an axe to grind." I would, however, most earnestly urge upon those who contemplate planting for market the propriety, if not the necessity, of adopting the new varieties possessing higher flavor and better qualities than the old, as the further cultivation of the taste of the fruit-consuming public must, at least in a few years, create the demand for such grapes. By crossings and by hybridization we now have grapes of different colors, ripening at different periods, and the

FLOWER OF SWEET-SCENTED VERNAL GRASS.—FIG. 195.

cultivation of the growers is most rapidly increasing. Now is the time to strike for the higher qualities—for all the rich spiciness attainable in the grape.

It is, comparatively, but a few years since the grafting of the grape was thought by most people to be a chimerical idea. Attempts were made by various methods, in a small way, and many of them proved failures. Whole vineyards are changed now by grafting, but this work is only done by experts who have gained their knowledge by long practice.

In conversation with Mr. Charles Downing, a few weeks since, this genial veteran in horticulture related to me the circumstances attending his first trials in the line of grape-vine grafting. He had a cutting of a desirable variety, from which he wished to test the fruit as soon as possible. He commenced operations by sawing off a large vine below the surface of the ground; he then proceeded with a carpenter's bit to bore a hole into this stock near the edge, a little less than the size of his graft, upon which he made a square, even shoulder an inch or less from the lower end, and trimmed it down to fit tightly in the hole in the stock. Grafting wax was used in the ordinary way, and then the soil was drawn up to stock and graft. The growth of the graft that season was extraordinary—about twenty feet—"but," said Mr. D., "I might have grafted a hundred in the same manner and ninety-nine may have missed."

I come at last to the caution intended to be given in this article: The outer harsh coat of the grape-vine is not the true bark, but seems intended by nature as covering for the sappy bark against the inclemencies of the seasons. Now, this is not to be regarded in matching the graft to the stock by any of the methods practiced, but the true *green* bark, which is very thin on the last year's growth, must be perfectly adjusted to the inner bark of the stock, which can be more plainly seen. Nor can this be performed successfully if the split by cleft-grafting is twisted and ragged. The wedge of the graft should also be longer than is usual in tree grafting.

It is insisted by Mr. J. H. Ricketts, of this place—who has had large practice in this special work—that in cleft-grafting small stocks two and three years old, the operation should be completed by winding first with large cord and over this fine copper wire, not larger than 1-16th of an inch. The wire is not to be loosened or removed until considerable growth of graft is attained. Grape wood will not impinge upon the graft so closely as the wood of fruit trees, which gives a show of reason to his argument.

In saddle-grafting in the house, wind the whole length of the saddle closely with cotton twine. This being placed in the ground, the cord will rot off as the stock and graft unite.

Newburgh, N. Y. A. A. B.

The Apiarian.

THE WORKER BEE.

IF we examine a hive in the month of May, June or July—the busy season of the year, when the population has attained its fullest development—we shall find therein three distinct kinds of bees—a queen, a large number of drones, and many thousand workers. Later in the season, usually after the first of September, the population will be found to consist of the queen and workers exclusively, as drones are not then tolerated in healthy colonies. It is superfluous to describe the worker bees minutely, as all who take an interest in the subject, have frequently observed them in the vicinity of the hive, or when gathering honey or pollen. They are not inappropriately called *workers*, though the queen is by no means an idle inmate of the hive. She lays all the eggs from which the young bees spring, and the workers perform all the other labors of the colony. They cleanse the interior of the dwelling, by removing thence all impurities; they close with propolis the cracks or crevices which might harbor worms or moths, or allow the escape of heat from within; they build the combs, nurse the brood, guard the hive, and provide all the honey, pollen, propolis and wax needed in the economy or essential to the prosperity of the colony.

Though each individual worker is, or can become, qualified to perform, in an emergency, all these several labors, yet ordinarily there is a subdivision of labor among them. Their duties may properly be classified under two heads—the internal or domestic, such as the production of wax, the building of comb, the nursing of brood, the capping of cells, and the garnering up of honey and pollen, and the external, such as the gathering of the substances and materials requisite for the support and welfare of the associated body. The bees that attend to the domestic duties, rarely leave the hive except for exercise; while the others are almost constantly on the wing. The workers are hatched from an impregnated egg, which can only be laid by an impregnated queen, and these eggs are always deposited in the small or worker cells. The egg hatches in three days. In six days the cell is capped over by the worker bees, and in twenty-one days from the laying of the egg, the bee emerges from the cell.

The workers possess an organ of defense—the sting—which they are quick to use if occasion requires. This is not curved, as in the queen, but is straight. The gland which secretes the poison is double, and the sack in which it is stored, is as large as a flax seed. The sting proper, is a triple organ, consisting of three sharp spears, very smooth and of exquisite polish. The most highly-wrought steel instruments, under a high magnifier, look rough and unfinished, while this part of the sting shows no such inequalities. One of these spears is canaliculate—that is, it forms an imperfect tube—and in this canal work the other two, which fill the vacant space, and thus the three make a complete tube, and through this tube, which connects with the poison sack, passes the poison. The slender spears which work in the tube are marvelously sharp, and project beyond it when used, and are worked alternately by small but powerful muscles, so that they may pass through buck-skin, or even the thick scarf-skin of the hand. They are also barbed at the end with teeth, seven of which are prominent, and extend out and back like the barb of a fish-hook. Hence the sting cannot be withdrawn if it penetrates any firm substance, and so, when used, it is drawn from the bee, and carries with it a portion of the alimentary canal, thus costing the poor bee its life.

The question—"How long may a worker live?" does not, consequently, admit of a precise and definite answer. It is certain the worker bee never attains a great age. Those reared in Autumn may live for eight or nine months, and if in queenless stocks, where little labor is performed, even longer; while those reared in Spring will wear out in three months, and when most busy, will often die in from 30 to 45 days. None of these bees survive the year through, so there is a limit to the number which may exist in a colony.

Prof. Cook places the number of workers in a good colony at from 1,500 to 4,000, but qualifies this statement by saying, "It is possible for a colony to be even much more populous."

An indirect function of all the bees is to supply animal heat, as their very life requires that the temperature inside the hive be maintained at a rate considerably above freezing. In the chemical processes attendant upon nutrition, much heat is generated, which may be considerably augmented at the pleasure of the bees, by forced respiration. The bees, too, by a rapid vibration of their wings, have the power to ventilate their hives, and thus reduce the temperature, when the weather is hot. Thus they moderate the heat of Summer and temper the cold of Winter. LIGURIAN.

Horticultural.

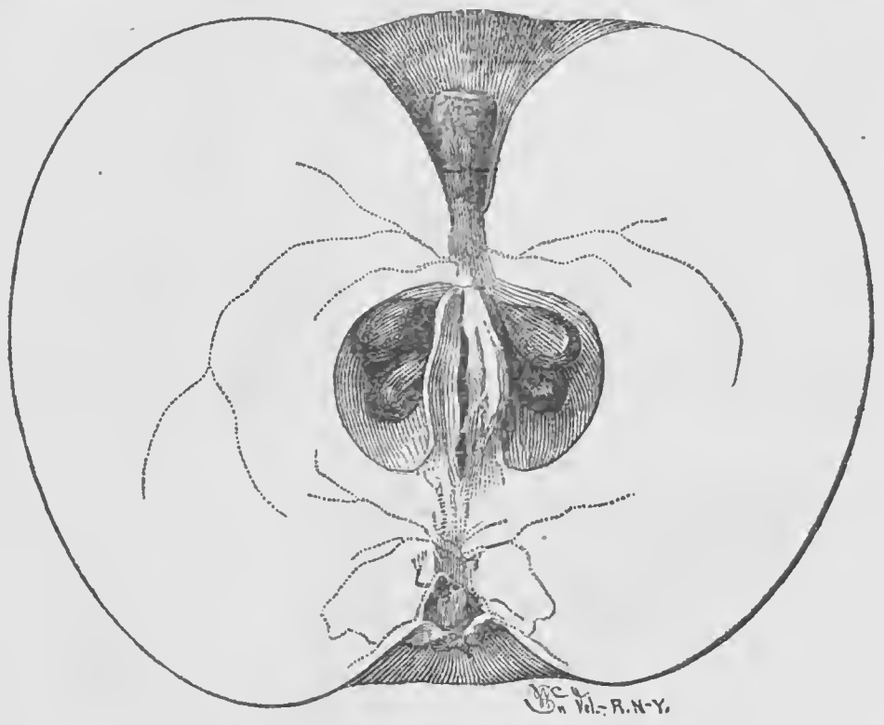
RURALISMS.

THE valne of the large nnmber of new coleus sent out last Spring is now undergoing discnssion, and the general conclusion seems to be that the list, for various reasons, should be reduced, at least for open-air use. I expressed myself to this effect several months ago, as did also the RURAL. There is too much sameness in many of the varieties produced by different parties; they are so much alike, indeed, that it requires an amazingly sharp eye to distinguish any difference between them. I procnred a couple of dozen last Spring and submitted them to rather rough usage in regard to exposure in the Summer and a low temperature during the Winter, to which many snccumbed. The following survived and now look well:—Paroquet (Hiawatha), Meteor, Glory of Antumn, Mrs. Kirkpatrick, Burning Bush, and Mrs. Barr. Paroquet showed itself to be the hardiest. Fortnnately, these are all good kinds, Glory of Autumn and Mrs. Kirkpatrick being especially beautiful. Kentish and several other new kinds are very beautiful in the hot-honse or a warm green-honse, but in the open air or in a low temperature in Winter they soon droop and die. The florist who has weeded out his list of coleus has done a wise thing for himself and a good thing for the horticultural community. Where different parties work for the same end and with the same materials, it is quite natural that the results arrived at should be very nearly alike; still, it is to be regretted that so many kinds of coleus and other plants, nearly or quite identical, should be offered for sale under different names. On the whole, old Verschaffeltii still remains unsurpassed for out-door work.

AS LONG as I can remember anything (how much longer I cannot say) it has been a practice among old-fashioned people, especially in the country, to propagate the oleander, ivy, and a few other plants from cuttings placed in a bottle of water; but not long since I called upon a lady who propagates nearly all her plants in this way. She had a very good collection, which she keeps in a sunny room, and grows them well, as was evident from their condition. I noticed perhaps a couple of dozen wide-mouthed bottles, each containing some slips, which I thought had been placed there temporarily for safe-keeping; but she said, "No; that is the way I root all my young plants;" and I found many of them well furnished with young roots. These bottles contained cuttings of coleus, achyranthes, scarlet pelargonium, fuchsia, verbena and several other kinds of plants. She further informed me that she learned the practice many years ago from her mother, and seldom lost a cutting. This method of propagating plants may be new to many, and may prove useful. I know that Cissus discolor and other plants besides the oleander will root in water. I would suggest that some of the RURAL family give the method a trial.

IT is generally supposed that what are called climbing plants must have something to climb on, and there are persons who do not grow this class of plants simply because they have no object on which the plant can climb. There are exceptions to most rules, and there are some among the climbers. Let us take, for example, the Thunbergia, a very beautiful climbing plant, and see what fine effects can be produced without the aid of supports. Prepare a circular or oval bed, or a border, of any convenient size, and at intervals of a foot or two put in three or four seeds of Thunbergia, either alata, aurantiaca, or alba, or all of them mixed. This must not be done till the weather becomes warm. When the plants are well up, thin them out, leaving only one in each spot. An earlier bloom may be had by sowing the seed under glass or in the house in shallow boxes, and transplanting to the beds as soon as the weather is warm enough. Let the plants run on the ground as they please, except that the end of a shoot will need turning occasionally to keep it within the bed or the border. The plants will in a few weeks mat the ground with a mass of beautiful green, which in due time will be gemmed all over with charming buff flowers. The effect is very fine, and will please some people better than a bed of scarlet pelargoniums. It is an inexpensive way of producing picturesque effects with several kinds of twining plants easily raised from seed. Plants with tendrils are not so good for the purpose as those without. There is no reason why a bed of gladioli, lilies and similar tall-growing plants should not be covered in this way, the green carpet being far more attractive than a naked bed of earth, with its accompanying weeds, which the Thunbergia will completely smother out.

IN riding in the cars I frequently pass a group of Fastigiate Maples, one large tree seeming to be the parent plant of the smaller ones near it. I am rather pleased with this form of the maple, and can readily conceive situations on the lawn and elsewhere where it would produce a pleasing effect. For instance, trees of this kind would find a suitable place near the dwelling, where those of a spreading habit would be quite inadmissible. Besides, these maples have claims on the score of utility, their erect habit of growth rendering them peculiarly fitted for close planting in lines or belts on exposed prairies, plains, etc., where protection from cold and strong winds is of the greatest importance to all kinds of growing crops, whether of fruit or grain; their rapid growth would soon make their influence felt. As wind-breaks they could be especially utilized at the West; and though not so good as evergreens for this purpose, they would grow up in less than half the time. The two combined would make a very thorough protection against almost any wind that blows. It would seem that this particular variety propagates itself from seed, which is a very important matter. I think I saw, a few years since, a Fastigiate Maple still more like the Lombardy Poplar in habit, on the grounds of the Messrs. Parsons at Flushing. I do not know whether these gentlemen ever propagated it, but it is worth looking up.



PECK'S PLEASANT APPLE.—FIG. 203.

Scientific and Useful.

DISINFECTION versus VENTILATION.

PROFESSOR F. H. STORER.

THE comparative merits of ventilation and disinfection are still hotly disputed, and it is not easy to find many persons in the ordinary walks of life who do not estimate unduly one or the other of these methods of purification. It is not, by any means, so generally known as it should be that in the majority of instances the two processes do not necessarily work to the same end, and that they are consequently not comparable one with the other. Each of the two processes is excellent in its place. Both of them are useful and necessary. Neither of them can be too highly commended. But they should, by good rights, be employed to help and supplement one the other, since, generally speaking, neither of them is competent to take the other's place.

Formerly, the idea was that disinfection consisted simply in getting rid of foul gases, but as we now have reason to believe, its chief merit lies in destroying minute living creatures. In the beginning, the question seemed to be how to get rid of unpleasant smells, and it was thought that the best way of doing this was to hide them. The burning of incense in churches, so as to conceal the unpleasant odors arising from graves beneath or from crowds within them, was a case in point; the fumigation of sick rooms is another, though, as we now have reason to believe, the scents and fumes did really work to destroy noxious germs and were consequently true processes of disinfection. They belong in the same category with the old system of fumigating travelers and their effects which still persists at the quarantine grounds of Southern Europe. So, too, the aromatic "thieves' vinegar," which enabled its inventors to plunder dead bodies with impunity during epidemics of the plague, doubtless acted to destroy the microscopic organisms by which infection is brought about. The popular prejudice in favor of the healthiness of pine groves and of "the smell of tar" as well as the Turkish practice of planting thick groves of cypress trees in their cemeteries doubtless depends upon a fact of the same order. The Orientals are said to believe that the aromatic odor of the cypress prevents all ill effects from the burial of the dead, and the idea is a just one. But beside these terebinthine and tarry products, there are numerous other substances which are known to be powerful disinfectants by virtue of their power to destroy microscopic organisms prejudicial to health, and one of the most important practical problems of the day is to find out convenient and efficient methods of using these various materials, and of familiarizing the public with their use.

Ventilation alone, as of a sick room, is wholly incompetent for the task now in question. Practically speaking, ventilation can neither destroy germs nor reduce the number of them in a given locality to any useful extent. The purpose of ventilation is very different from this. It does invaluable service by removing noxious gases and by diluting them with so much pure air that they no longer have power to do harm. But this dilution of the air has comparatively little significance as regards the organized beings. Some part of them may be swept away, indeed, from apartments where the air is constantly renewed; but so long as a sufficient number of individuals is left to perpetuate the species, and so long as food for them to live upon remains, they will continue to prosper, so enormous is their reproductive power. In order to cope with them effectively, it is necessary to resort to disinfectants which shall either destroy the organisms, root and branch, or, at the least, hinder them from multiplying. In order to gain these ends, the disinfectant had better be actually applied to the substances which the organisms infest, or to those which are to be protected from their ravages, in order that it may come into intimate, destructive contact with them.

Of course, mere ventilation may, and often does, do good work by checking the increase of microscopic organisms in that it removes dampness, which is specially favorable for the growth of molds, for example. Ventilation, like the other forms of cleanliness, is invaluable in that it often works against the formation of nesting places for the noxious organisms. But it is none the less true in very many cases that the action of pure, dry air needs to be re-enforced by that of some chemical agent, which shall serve to destroy hurtful organisms. It so happens that many of the more powerful disinfectants can decompose offensive gases, as well as destroy the microscopic organisms now in question, and it was formerly thought that the sole use of disinfection was to decompose gaseous matters. If this were really so the believers in the sufficiency of thoroughgoing ventilation would be much nearer right than they are, for all kinds of gases can be removed in that way if pains enough be taken. But it is known nowadays, from the results of numberless observations and researches, that not foul gases alone but minute living things play a highly important part, and probably the principal part, in the production of many kinds of putrefaction, decay, and disease. Hence it is that when once these creatures have invaded our premises, it is as necessary to resort to agents fit to destroy them as it is in ordinary life to keep in practice the agencies—such as cleanliness and ventilation—which tend to hinder or prevent such invasion.

Pomological.

PECK'S PLEASANT APPLE.

On page 190 of the R. N.-Y. (March 19) was presented an outline-sketch of Peck's Pleasant Apple. Mr. Charles Downing sends us the following communication regarding it and a specimen apple which well represents this excellent variety at its best. Mr. Downing's note is as follows:

NEWBURGH, N. Y., March, 25, '81.

"I was surprised to see such a caricature outline of the Pleasant Apple in the RURAL, and if I had time would give you a good scolding, but I can only say that the apple is generally of a regular form and good size. I send you an apple by mail to show its regularity; this specimen is over-large and too high-colored, and over-ripe."

The Poultry Yard.

A MISTAKE IN FEEDING POULTRY.

I HAVE been annoyed at times almost beyond endurance in my endeavors to have my work done just as I direct. In no one instance is this annoyance greater than in my almost futile attempts to have my poultry cared for in a way that shall show some little regard for my wishes in the matter. I have a large flock of hens—mature birds, all of them, not fancy specimens, but just such hens as any farmer would keep, and I try to keep them well; but all my suggestions, wishes and even positive orders avail nothing to prevent them from being fed almost exclusively upon sloppy food. The trouble is just here—people raising poultry get in the habit of feeding young chicks soft food and as they grow to maturity follow up the practice. This practice is very faulty; chickens are young indeed, when they cannot consume some solid food such as the smaller grains. It is true that young chickens will do much better for a time upon soft food, but the proportion of solid food should be increased as the chicks attain larger growth. The mere fact that all kinds of poultry, both young and old, devour all kinds of sloppy, wasby food with avidity, proves nothing, as will be speedily found by comparing the increase in weight or productive capacity with the unusual quantity of soft food devoured. The reason for all this should be plain to the most casual observer:—soft food, as usually made, is lacking in the nourishment required by poultry. The attempt to fatten fowls upon this sort of food is never satisfactory. The laxity that is the result of a continued diet of soft feed very seriously interferes with the egg-producing capacity of the best layers in the world. Now, I do not wish to have it inferred that I want my hens fed always upon corn or barley, or that they should never be fed soft food. But as a change of pastures is beneficial to sheep and calves, so I would change the diet of my poultry very often, and occasionally give them soft food but never confine them for even a short time to that diet. In Winter all fowls are better if they never taste soft food, if they have plenty of meat scraps and corn—in short, the best possible heat-producing diet that can be given them. The profits from poultry depend very much upon the same rules and principles that govern the profits of the dairy. F. K. MORELAND.

Miscellaneous.

ROCKERIES.

(See page 254.)

MANY suppose that a rockery, if one has the stones and the means of piling them together, is a structure very easily arranged. But we have always thought that there is room for the display of great taste in rockeries, and that those we often see in gardens are far from ornamental. Rocks themselves cannot be considered fitting articles wherewith to adorn the lawn, and unless they are so arranged as to form a seemingly natural part of the scene, might better not be introduced. Small rockeries are at best incongruities. It is impossible so to arrange them as to offer any excuse for the incongruity of their existence. The engraving on p. 254 shows a small part of a rockery at Bentham Hall, Shropshire, England, and illustrates what we would say as to the scale on which such combinations should be arranged to produce pleasing effects. The selection of plants also well adapted to such structures can be made only by horticulturists of experience and taste.

THE CUT-LEAVED WEEPING BIRCH.—In your recent Hardy Shrub and Tree Special, I am sorry that so little is said of the Cut-leaved Weeping Birch. I regard this tree very highly and would place it first upon a list of ornamental lawn trees. The growth is upright with pendulous branches; its shape is symmetrical and its foliage is of a beautiful deep green color. The leaves are finely cut. It is graceful, stately and handsome, and with age it increases in beauty. The tree requires no trimming, as no art can improve the shape nature has given it.

Rochester, N. Y. H. T. J.

A BUNDLE OF THINGS.

That Sap-sucker Once More.

AS SEVERAL excellent articles have already appeared on the character and habits of the sap-sucker, I shall add nothing to them except to touch upon the question, which seems to have been left unsettled, whether this bird really does that which his name implies. In a paper on this subject which was published in

Appleton's Journal for December 7th, 1872, James Manrice Thompson, who appears to have watched the sap-sucker closely, says that his food is the sap and juices of green trees, *and nothing else.* Dr. Hoskins says that there is no evidence that he sucks sap, and quotes Mr. Fairbanks as stating that the bird goes his rounds from tree to tree for the purpose of securing the insects attracted by the exuding juice. Mr. Thompson, on the other hand, thinks that he flies from tree to tree or pecks new holes while he is waiting for those previously pecked to fill up with sap. Mr. T. professes to have actually seen him drinking, and remarks that he is more easily heard than seen, since he always keeps the body of the tree between himself and the observer, and this is probably the reason why so little is generally known concerning him. It occurred to me, when General Noble expressed the opinion that in making the holes the bird was hunting for worms, that this could not be possible unless there was a worm in every square inch of the trunk of the tree, which I thought not at all probable. However, as I have since had reason to know, this supposition might not be an unreasonable one if the trees were not otherwise sound and green, for thousands of our finest pine trees have died during the past Summer, in the bodies of which may be found two or three worms for every square inch of surface. The outer bark of these trees is all roughly chiseled off by the woodpeckers in search of worms. In the description given of the sap-sucker by Mr. Thompson he differs somewhat from Mr. Robson, the former stating that the bird's back from neck to tail has a light brownish stripe, that his head is striped with dull white and dingy black, with a barely perceptible spot of red on the occiput, and that his breast is of a cloudy white; while the latter says he has a *bright* red spot on his head, and that his breast has a black spot in the center of it. Both agree in saying that he descends the tree tail foremost.

Ox Warbles.

A full description of the species of gad-fly which attacks cattle has also recently been published in the RURAL. I wish to add that the maggots of this fly are called by many farmers "wolves"—a term which may be a corruption of *warbles*, a name given in England to the swellings occasioned by them on the backs of cattle. These swellings are also called the wourms or warmals, that is, wormholes.

It may not be generally known that there is also a kind of gad-fly which attacks both rabbits and squirrels. The eggs are always deposited under the throats of these animals. Between the 1st and 20th of August last I noticed that about one-half of the young rabbits could scarcely get about on account of their swollen throats, and they could frequently be caught without difficulty. I caught one of them, and with a penknife cut from its throat no less than ten maggots, the largest of them being nearly the size and shape of an ordinary man's thumb from the first joint to the end, and of a rather dark-brown color.

Root Pruning—Estimated Yields of Corn.

In a leader of January 22 the editor of the RURAL argues that it is just as reasonable to suppose that the extraordinary yield which attended his flat and surface culture, was attributable to that method of culture as that the yield of the crop reported by Dr. Sturtevant was due to root-pruning. The case of a neighbor is cited who, although he applied 1,200 pounds of fertilizer per acre, raised an average crop of only 75 or 80 bushels, following the method advocated by Dr. Sturtevant. Referring to the RURAL'S experiment with Fultz Wheat, we find that an application of 500 pounds of fertilizer, which had the whole Winter to dissolve, yielded at the rate of 26 bushels, while a plot of equal size, without any fertilizer, yielded at the rate of 28: it is certainly allowable to suppose that owing to the dry season, or from some other cause, the 1,200 pounds may not have had any effect on the corn of the RURAL'S neighbor, or, if any effect at all, one not very beneficial. My own practice has always been to keep the surface level, but at the same time to plow deep and break the roots. I see no reason as yet to change this practice. I think that the great yield of corn at the Rural Farm was principally due to the fact that the field *had not been broken within fourteen years.* It is well known to farmers that an old sod, particularly if it be one of Blue Grass, is the very best of manure for corn, the plants producing more grain and less stover. It must be confessed that, notwithstanding all that has been said on the subject, there yet remains enough about the culture and habits of corn, which we do not know, to keep us thinking. The RURAL'S corn experiment has impressed on me more forcibly than ever another fact, and that is, that no estimated yield of grain, however fairly made, will hold out when the crop is actually measured; since the Blount Corn fell from 142 to 132, and the Chester from an average, on four acres, of 150 to 116 bushels per acre. Would it not be better not to publish results until they are accurately ascertained? I note that a seedsman, who has for sale the fertilizer used by the RURAL, ascribes in his catalogue the large increase to his fertilizer, and gives the estimated yield of 150 bushels per acre on four acres of Chester, and 142 on not quite an acre of Blount Corn, instead of the actual yield. [The yield of the *best* acre of Chester was nearly 160 bushels.—EDS.

Hillside vs. Sidehill.

As contributors sometimes indulge in criticism on words which are the names of farm objects or which relate to agriculture, it will not be amiss, perhaps, if I undertake the defence of an old word which many agricultural writers seem to have forgotten how to use—hillside. They have somehow gotten it turned round and call it a sidehill. They might just as well call a river-bank a bank-river, or a seashore a shore-sea. Hillside is the side of a hill; sidehill is the hill of a side, as bank-river is the river of a bank, and shore-sea the sea of a shore. What objects in nature such things are I leave for those to conceive who find names for them. HUGH L. WYSOR.

Pulaski Co., Va.

BOOKS, CATALOGUES, ETC.

THE PACIFIC GUANO COMPANY: Its History; its Products and Trade; its Relations to Agriculture

ALSO, SOLUBLE PACIFIC GUANO, manufactured by the Pacific Guano Company, of Boston, Mass. The first of these pamphlets gives a history of the Company—which is chartered by the State of Massachusetts with a capital of $1,000,000—and also tells about the nature of its business. The second describes the composition, etc., of Soluble Pacific Guano, gives directions for its use on various crops and presents a large number of testimonials of its excellent effects from farmers in different parts of the country. Both can be had *gratis* on application by P. O. card to Messrs. Glidden & Curtis, Tremont Bank Building, Boston, Mass.

WEBB & SONS, Wordsley, Strowbridge, England. Catalogue of flower, vegetable and farm seeds of every description. Among the many foreign catalogues which we have recently noticed this, perhaps, is one of the most comprehensive. It consists of 120 large pages; is profusely illustrated, with illuminated covers and a number of colored plates.

A PAMPHLET of 24 pages on "Extracted Honey," tells how to harvest, handle and market it. The authors, Charles and C. P. Dadant, of Hamilton, Illinois, have handled and sold 45,000 pounds of extracted honey in three years and this pamphlet tells how it was done.

RURAL BRIEFLETS.

RAKE the lawns—Clear up the rubbish wherever it exists—Attend to drains and cesspools—Carry them away from the house, cisterns and wells—Sow peas—Sow oats and Spring wheat—Prepare the garden for new strawberry patches; for the Rural asparagus seeds, Branching Sorghum, etc.; for early potatoes—Set cold-frames—Plant tomato seeds, celery, cabbage, cauliflower and lettuce seeds. Prepare for radishes, spinach, parsnips, onions, parsley, beets and early turnips—Leave beans, melons, sweet corn, cucumbers, squashes until the ground becomes warm—It is well to remember that tomatoes may be sown in the open ground as late as June 15 and still produce a fine crop. For catsup, perhaps, this is the best way. Do not set out pot-grown or cold-frame tomato plants until all danger of frost is over—We have given erect arbor supports for tomatoes a thorough trial. They are well enough for those who have lots of time and who take a pride in having everything neat and trim. But the plan does not pay. The vines need tying every few days—and thinning out as well. This, owing to the offensive odor of the vines, is disagreeable work. So-called trellises are little better. They confine the plants too closely. Three heavy stakes driven in so as to form an equilateral triangle and connected with strong cord or laths nailed on *as needed*, we have found the most serviceable of any contrivance we are familiar with. Laying brush or something of the kind under the plants for them to rest upon when they fall over, is also a very good plan, if appearances are disregarded—Sow grass seed upon bare spots of the lawn. Red-top for lawns in general is as good a kind as any. Sow it thickly—not less than three bushels to the acre when sown alone. . . . . .

WE are in receipt of a treatise of 44 pages upon concentrated fertilizers, from the Mapes Formula and Peruvian Guano Co., 158 Front St., N. Y. We give this treatise special notice for two reasons:—One is that it reprints the entire story of our great yields of Chester County Mammoth and Blount's Corn with the certificates of the several committees who visited the Rural Farm and carefully estimated the yield. This is copied from our Special Corn Number for which we have had very many applications since the edition was exhausted. It reprints also an interesting article by Mr. E. Williams published in the N. Y. Tribune respecting his visit to the Rural Farm; another by the agricultural editor of the N. Y. World. The other reason is that it presents many letters from farmers in different parts of the country who have used special manures, stating kinds and quantities used and the supposed effects upon different crops. A description and price list of all the different kinds of special manures is appended, which will be found to answer many questions which we are daily receiving. We desire in every way to aid in a better understanding of commercial fertilizers and commend this treatise to our readers, to whom it will be sent on application, without charge. . . . . .

AMONG our foreign catalogues recently received is one from L Paillet, Chatenay Valley, near Paris, France. Some of the descriptions rendered in English are amusing. Here is one which we copy word for word:

"NEW PELARGONIUM—MONSIEUR EMILE SORBET. This new variety is without any doubt the best plant ever sent out to the trade since a long time, this variety is very vigourous, freen blooming, foliage deep green, flower large and a of deep red crimson colour, velvelted and very brillant, the noseguay is well shaped, well furnish; this variety as bedding plant is the most beautifullest one. The colour is so brillant that if hardly the eyes can support the look of it." . . . . . .

WE learn with regret that Mr. Fay, the originator of "Fay's Prolific Currant," is dead. .

ONE new subscriber of the RURAL returns our package of seeds, writing that he is greatly disappointed. He prefers roses, new varieties of peas, etc. One of the several objections to our "Distributions" is that it takes new subscribers a considerable time to understand them. . . . . .

MR. JOSSELYN, we learn from a private letter, says that Light Brahmas are his favorite fowls because they are the largest, good layers and the best table fowl he ever had. He has never bred Games or Dorkings. Dark Brahmas, he says, are good; but fine ones are not so easy to breed. Plymouth Rocks, he says, are popular but he does not like them and never did, though he acknowledges that they are good fowls. Black Cochins are about the best layers he ever had. "But," says Mr. Josselyn, "all fowls want a good run. No fowl will do well in a little pen without grass."

WE are right glad to know that the Kansas State Agricultural College (Manhattan) is flourishing finely. Prof. E. M. Shelton, writes us, under date of March 19th: "The attendance is large and the interest taken in agricultural matters is very great. About 90 per cent. of all of our students are the sons of farmers. . . . . .

WE have received the following gratifying communication from the owner of Car Boy, presented in R. N.-Y. of March 19. "The RURAL with Car Boy arrived yesterday. I took it to the barn and all the men recognized it at once. On my way back to the house I met a negro man who, though a good fellow, has never cultivated the Beautiful nor given attention to the arts. Holding the paper up before him, but at some distance, I said, "Bob, here is a nice picture." His face spread and he exclaimed, "Well, if they ain't gone and done put Car Boy in dat paper!" I know of but one better test than that. When the eye of the owner falls upon it, and he sees in it a faithful representation of the animal he has carefully studied and loves, the artist has the most satisfactory evidence of his success. In this engraving I see my bull. It is true and for its truth. I esteem it highly. I know not how much to thank you for it." . . . . . .

What Others Say.

THE following paragraphs as to what Messrs. Read and Pell have said in late speeches, we find in the Mark Lane Express of latest date: Hereford breeders will be pleased to hear that with respect to Herefords and Short-horns, Mr. Pell thinks that the cross between the Hereford bull and the Texan cow is better than when the Short-horn bull is used, and that "there is every probability that the Hereford bull will become the bull of the Western plains."

THE increase in the number of cattle in America, according to Mr. Read, is a million a year.

MESSRS. READ and PELL concurred in stating that British producers of mutton, wool, and barley have little to fear from American competition. Mr. Pell added oats. Mr. Read said:—"I should say with regard to my own farm that I shall try to grow more mutton, and wool, and barley, and less wheat and beef.'

AS to dead meat and its transit, Mr. Read said:—"They have all sorts of contrivances for preserving dead meat which our railway companies do not give in this country, which our butchers do not appreciate or seem to wish for; and the American importers did complain very bitterly of the way in which the meat is handled in this country."

AGAIN, with respect to the superiority of the American system of preserving meat, Mr. Pell said:—"We were fed on American meat in going from Liverpool (to the United States), which had been brought out from America, and had been kept on board the ship whilst in England, and was carried back again; and we lived upon it on board ship, and had fresh vegetables too that had been brought from America." Mr. Read added:—"Then at the great hotels they have ice larders, and they do not consider meat at the hotels in a good state for consumption under three weeks old."

THE London Live Stock Journal says that the Birmingham magistrates lately had before them a case in which another popular form of cheap meat, namely, sausages, and the various compounds sold in tins and pots, were concerned. The chopped meat prepared for sale in this guise is, it appears, made to look "healthy" by a liberal use of red ochre; and over a thousand pounds weight thus adulterated were seized and condemned by the sanitary inspectors, being, as the officers said, worse than any meat they had ever seen, "every stage in the process of disease being represented." Until some wholesale importer or manufacturer is put on trial for poisoning, it does not seem as if the public will ever be successfully protected from the unprincipled scoundrels who, for the greed of gain, recklessly expose the lives and health of the community at large. In the present case prosecution is promised, and we trust it will be enforced in the most stringent manner.

THE old Early York Cabbage is scarcely grown now by market gardeners, as there are other early varieties of greater excellence, and Mr. W. F. Brown advices his readers in the Farm and Fireside to try the Winningstadt, Jersey Wakefield or Early Dwarf Flat Dutch in its place. For Winter he has never found anything better than the Premium Flat Dutch and Stone Mason Drumhead, and both these varieties are now considered standard and are very reliable for heading.

MR. BROWN is quite right in thinking there is some choice in cucumbers, even. He has found that for all purposes the Early Cluster gives the best satisfaction. It does not run much to vine, is very prolific, and makes a pickle of the best size and shape. It is in bearing in six weeks, if not planted until the weather is warm and settled.

THE Golden Wax Bean can be used as a shell bean, but is not so good for cooking in the pod; seeds white with red eye. The Giant Wax is a pole variety with red seeds, somewhat flattened, and large, flat pods the color of the Black Wax. It is very prolific and the quality is excellent. Dreer's Improved Lima is the best flavored shell bean Mr. Brown ever used. The seeds are a greenish white, very thick, and grow so compact in the pods as to be flattened at the ends; very large, and tender. The most profitable and satisfactory garden bean he finds to be the small Lima. It is some weeks earlier than the large Lima, much easier shelled, and will yield nearly or quite double.

A GOOD EXAMPLE.—The members of the Council of the Royal Agricultural Society of Ireland are about to introduce a novelty in instructing the peasantry of the country in improved methods of dairying, according to the Live Stock Journal of London. At their last meeting, £140 were, on the proposition of Canon Bagot, voted to defray the expenses of a "traveling dairy," and a committee, consisting of Colonel Vesey, Canon Bagot, Mr. James Robertson, Mr. G. A. Stephens, and Mr. Wm. Young, was appointed to carry the scheme into operation. This "traveling dairy" is to consist of a sort of shed, constructed somewhat like a railway wagon, which can be easily transferred from place to place, and is to be fitted up with all the modern dairy appliances, including churns, pans, butter-workers, &c. The dairy is to visit all the shows in connection with the central society, and on these occasions the best systems of butter making and packing are to be practically exemplified by a skillful dairymaid, whose husband is to have charge of the entire business, and be capable of delivering lectures on dairying. One portion of this educational scheme, to which Canon Bagot attached a great deal of importance, is the careful packing of butter for the Dublin and English markets, as the present modes are not by any means commendable. The success of this innovation in dairy education is looked forward to with great interest. How would this method answer to instruct *our* "peasantry" in improved methods of dairying?

THE following from the N. Y. Tribune shows that barb-wire fences have their advocates. "I have in use on my farm post and oak board, post and rail, Osage Orange and

barb wire fences, and I prefer the last to either of the others. Reasons are: It takes fewer posts, costs nothing for repairs and is a barrier to all my stock, and no stock that are accustomed to it will be injured. Twice in the past year I had a pair of horses, attached to a wagon, run away in a field fenced with barb wire and in both instances they ran twice through the only open gate in the field before being secured. Frightened as they were they kept clear of the barb-wire.

PYRETHRUM.—A writer in the same journal gives his experience with pyrethrum which well accords with what has appeared in these columns respecting its value as an insecticide. "I have tried good pyrethrum (Persian or Dalmatian Insect powder) for lice on pigs, cattle and horses, by sprinkling it upon and rubbing it into the hair, and on chickens by blowing it under the feathers with a bellows, and find that it is harmless to the chick just hatched, also sure death to fleas on dogs. I have tried it on many kinds of insects—cabbage worms, potato bugs, flies, bees, moths, spiders—and I have failed to find the insect that would not succumb to contact; and, barring the expense, I consider it ahead of all other powders, with the added benefit that it seems not to be the least injurious to vertebrate animals."

ECONOMIZING LAND.—We see it somewhere recommended, but it is by no means a new idea, remarks the Germantown Telegraph, that, in setting out apple orchards, the trees of which should not be less than 30 feet apart, to plant peach trees between the apples. They will not interfere with the young apple trees for many years, and then not until about two generations of the peach tree shall have passed away. We have referred to this economizing of space on several occasions, having seen it adopted by some first-class fruit raisers.

THE Lumberman says that in New York there are about 500 venders of sawdust, having a capital of $200 000 invested, and doing a business of $2 000,000 annually. Forty years ago the mills were glad to have sawdust carted away; 25 years ago it could be bought for 50 cents a load, but the price has increased, and now it brings $3 50 a load at the mills. It is used at the hotels, eating-houses, groceries and other business places. It is wet and spread over floors in order to make the sweeping cleaner work. Plumbers use a great deal about pipes and buildings to deaden walls and floors. Soda-water men and packers of glass and small articles of every kind use it, and dolls and some living creatures are more or less stuffed with it. Yellow pine makes the best sawdust, as it is the least dusty, and has a pungent, healthy smell. But any white wood dust will do. Black-walnut sawdust will not sell, and is burned.

SOME ONE who has had a sad experience in the purchase of a horse says that he asked the dealer how much he would take to warrant the horse good, and that the philanthroplst replied at once that he would not make any charge—that is, he would warrant him good for nothing. . . . . Appearances are nothing if you are in the right; but if you are in the wrong, you must pay especial attention to them.

Everywhere.

RURAL SPECIAL REPORTS.

KANSAS, Caldwell, Sumner Co., March 18.—It has been snowing all day, but melting as it fell. We have had the severest Winter ever known in this part of Kansas. All peach buds are nearly or quite, killed. Raspberries and blackberries are badly frozen back. Winter wheat that was sown broadcast is very badly frozen out. Drilled wheat is all right. Sowing oats and plowing for corn are the order of the day at present. About two-thirds of the oat crop are sown. We begin planting corn about the first of April. A great many cattle have died in the Indian Territory south and southwest of us, this Winter. All the streams have been frozen over, some of them solid to the bottom, causing stock almost as much suffering from thirst as from cold and starvation. All the large herds of Texas cattle have to go through the Winter on the range without grain or fodder of any kind, which is pretty rough on them when the prairie grass is covered with snow for weeks at a time, as it has been this Winter. S. K.

KANSAS, Downs, Osborne Co., March 18.—This is the most backward Spring we have ever had in this part of Kansas. No farm work is done yet. A considerable quantity of corn is still in the fields. It is too wet to get on the ground and it is freezing every night. Early-sown wheat looks well; late-sown makes no show. With the usual amount of rain we expect good crops the coming season. W. A. H.

MO., Pleasant Mount, Miller Co., March 21.—We have just had the heaviest snow-fall of the year. It commenced on the evening of the 18th and continued without intermission until late at night on the 19th. At least 20 inches of snow fell and is now thawing rapidly. This will delay Spring work at least another week, as the ground was already too wet to work; and as creeks and rivers were already full this may cause considerable damage by floods. This time last year farmers were through sowing oats, but so far no one has sown any at all. In fact, quite a number of farmers have not been able to gather out all their corn, and this fact will in some measure retard Spring work. Fruit is damaged considerably, but is not all killed. I have examined buds and find a few peach buds alive and also some of those of the apple and plum. Winter wheat looks well considering the backward Spring. Fodder with a large number of farmers is getting scarce, as the Winter has been an uncommonly long one. N. J. S.

MO., Montgomery Co., March 22.—The storm of March 19 was the worst of the season. Fully 18 inches of snow fell and in places the drifts completely block up the roads. S. B. C.

NEBRASKA, Doniphan, Hall Co., March 14.—We have had the severest Winter here ever known. It set in early and since November 1st, we have had but few pleasant days, and since the 1st of December we have had snow upon the ground from three to eighteen inches deep, and good sleighing most of the time. Small fruits are not injured. There is but little of other kinds raised here yet, this being a new country. Rye looks well; but little Fall wheat is sown here. Farmers expect good Spring wheat this year, if the Summer season is favorable. G. C H.

N. Y., Clinton, Oneida Co., March 25.—We have had a splendid Winter for business, although there has been some very cold weather, with good sleighing since the middle of November. The 8th of March saw the first wagon on the road, so that we had 115 days' good sleighing. Winter wheat is looking fine, having been covered with snow all Winter and having made a good growth last Fall. Owing to the dry season hay is scarce and is selling for $18 to $20 per ton; oats, 50c., potatoes, 50c.; corn, 60c to 65c. S. C. G.

N. C., Lynn, Polk Co., March 21.—The contributor to this department from Brookston, N. C., in referring to the "much lauded Thermal Belt" in the RURAL for March 19, does an injustice when he says Dr. McAboy "evaded a direct answer," when asked whether common late seedling peaches were not the sort that had failed here "only twice in 50 years." Now, I could not answer that question from my own knowledge, as I was not here to know the facts. I take it for granted that until I planted budded fruit here, some nine or ten years ago, all the fruits on the "Belt" were native seedlings. We do not know any difference between the late and early, or between seedlings and budded fruit. The "Belt" had a full crop last year and there was little or no fruit for 100 miles north or south of us. The papers say that the trees are killed far south of us as well as the fruit. At this writing the peach trees are in full bloom giving assurance of abundant crops. Should this prove true the fame of the Belt will be established. The Spring planting is now over and at least 5,000 peach and pear and apple trees have been planted this season. No blight is feared in pear trees. L. R. M'A.

The Querist.

ANSWERS TO CORRESPONDENTS.

Muriate of Potash and Wood Ashes.

A. S., Westover, Md., asks, 1, whether it is desirable to use muriate of potash on soils on which wood ashes have proved to be a good manure; 2, how will the action of the potash compare with that of wood ashes; 3, how much of the potash would be equal to one bushel of good ashes; 4, will the potash dissolve in time to be of use to the present crop, if applied directly to the soil; 5, would the potash be a good fertilizer for corn, and how much should be used per acre.

ANSWER BY PROF. F. H. STORER.

1. That depends upon the kind of soil. It would be well to try the experiment, anyway. 2. For some kinds of crops, such as clover and beans, for example, the muriate of potash might perhaps do as well as wood ashes. The muriate is a good source of potassic food for plants, but it is a "special" manure, while wood ashes lack nothing but nitrogen to bring them into the category known as complete fertilizers. The muriate does not contain any phosphoric acid, lime, etc., as ashes do, and it can neither alter the humus of the soil nor the mechanical textnre of the soil as ashes can. 3. Can only be answered by experiment upon the particular field you would wish to cultivate. It is probable that in some cases no amount of the muriate would serve as well as wood ashes. 4. Yes. 5. It is not unlikely that it would be, especially if it were used in conjunction with guano, fish scrap, meat-dust, cotton-seed meal, or the like. 200 pounds of the muriate might be used to the acre. Perhaps a smaller amount than this would be sufficient.

Cooling Milk, etc.

O. R., Ann Arbor, Mich., asks, 1, the best method of cooling milk for retailing about the city; 2, will the use of ice injure the keeping qualities; 3, would pouring the milk on ice as it passed through the strainer cause too sudden a cooling; 4, would the amount of water added to the milk in doing this be sufficient to constitute a fraud on the consumer; 5, what is the best way to feed brewers' grains in warm weather; 6, could they be sun-dried sufficiently to be stored safely in bulk.

ANSWER BY PROF. L. B ARNOLD.

A convenient and expeditious way for cooling milk is to strain it into a tin vat surrounded with cold water, similar to vats in cheese factories, and to float crushed ice and salt on it in a tin floater, moving it frequently over the surface of the milk as it is being strained into the vat. By making the bottom of the floater flat and large enough to cover a considerable portion of the surface of the milk, it will be ready for distribution about as soon as the milking is done. 2, If put directly into the milk, yes. 3, Yes. 4, Yes. 5, Use tight casks or vats large enough to hold one day's feeding—one for each day between dates of receiving the grains. Fill and press down with heavy weights resting on loose covers. Cover with water to exclude air, using salt enough in it to supply the cows. The grains should not form the exclusive feed, and should be renewed at the shortest possible intervals. Heavy feeding and stale grains make objectionable milk. 6, Not without more labor than will pay. The grains are not as good after drying as before.

Quarantining Live Stock.

M. F. C., Fort Griffin, Texas, asks what is meant by quarantining cattle on account of the risk other cattle run of contracting contagious diseases from them, and whether the quarantining is enforced by the State or the United States.

ANS.—Originally the term quarantine meant 40 days during which a ship after arriving in a port, when suspected of being infected with a malignant or contagious disease, was obliged to have no intercourse with the shore, lest the supposed or real infection should be spread by communication. It was thought that 40 days' detention apart would afford time to abate the disease and remove risk of infection. The term still implies prohibition of intercourse; but the length of time during which it is to last is undetermined by the word. When cattle arrive in this country from the United Kingdom and other countries where contagious diseases are prevalent among cattle, they are quarantined for 90 days—or ought to be if the laws are obeyed—by the United States Government, which has charge of our commerce with foreign nations. Some of the Atlantic States, notably New York, New Jersey and Pennsylvania, anxious to eradicate pleuro-pneumonia from among their herds, have lately passed laws authorizing properly appointed officers to slaughter infected animals or to quarantine them until all danger of their spreading the disease has passed. This is a matter within the jurisdiction of the individual States, with which the United States has not yet meddled.

Perennial Rye Grass.

H. C. P., Albion, Mich., asks when should Perennial Rye Grass be sown; what amount of seed should be sown per acre, and whether it should be sown alone or with other grasses.

ANS.—This is, we suppose, Lolium perenne, a grass much esteemed in England, where it is considered one of the most valuable of the cultivated grasses. But it is thought to be inferior in nutritive value to Orchard Grass when green. It must be cut for hay when in blossom or it becomes hard and is not relished by stock. Flint says it is not to be compared to Timothy or Orchard Grass. It produces a great amount of seed, soon arrives at maturity, exhausts the soil, lasts for six or seven years, and then dies out. It takes just about the same place in England that Timothy does here. It has short roots so that it will not endure severe droughts and is therefore not adapted to gravelly, dry soils. Mr Killebrew does not think it as of special value for Tennessee farmers. We have several times referred to this grass in the R. N.-Y. during the past three years. Sow, as soon as the land can be prepared, from two to three bushels per acre. We should say it had better be sown alone—if at all.

Miscellaneous.

E. E. S., Papillon, Neb., asks, 1, which is the proper time to begin farming accounts—Jan. 1 or March 1; 2, would it hurt fruit trees that are bearing to put a bolt through them to prevent them from splitting where they are forked; 3, where can apple root grafts true to name be bought.

ANS.—1. The first of January is the best time to begin farm accounts, as well as all others. But, if more convenient, they may commence any time between that and first of March. 2. We have seen bolts, both of wood and iron, put through trees to prevent the trunks from splitting; but unless the tree is pretty vigorous and it is carefully done, this might injure it more or less. The bolt inserted should not be any larger than the auger-hole bored through to receive it, otherwise in driving it in, you might split the tree. The safest way, however, which we have often practiced, is to put a belt of cloth around the tree, so thick that a cord or rope will not cut through it, then tie up with a strong cord or rope, as required by the size of the tree. After this, if the rope is not sufficiently tight to hold well, put in thin narrow wedges enough between it and the cloth belt to make it hold tight. This rope should be slacked every Spring, as much as the trunk of the tree has grown in diameter the preceding Summer, 3. Of any nurserymen. See their advertisements.

A. B., Plank Road N. Y., asks what mode of training the Concord Grape is most in vogue in Southern New Jersey, at Vineland and and among the German vine-growers in Ocean County, and whether the Rose-bug ever shows itself there.

ANS.—An extensive vineyardist writes us from Vineland in answer to the above inquiry: "The modes of training grapes with us are, first, single posts, eight feet apart and from four to eight feet high; second, two wires on posts 16 feet apart, vines eight feet, with from two to four canes, on the renewal system. Every one has a pet theory of his own; some have high posts and a trellis overhead, and so on. The Rose-bug has never seriously troubled us. A few make their appearance every year on the white roses, and sometimes do a little damage to the grapes, but nothing serious."

H. A. P., Zanesville, Ohio, asks where can the Black Alder be got.

ANS.—The Black Alder, or Winterberry (Ilex verticillata, or Prinos verticillatus), is very common in low grounds in almost every part of the country. It blooms in the above section in late May. Possibly our friend refers to the Alnus incana, which is a true alder, and is sometimes called the Black Alder. This is a shrub or small tree from eight to twenty feet high, forming thickets along streams. It is better known as the Speckled Alder. Either can be procured, if not in the woods or fields, of nurserymen in general.

G. C. B., North Rochester, Mass., sends for botanical name a plant that is there grown in gardens under the name of "Old Maid's Pink." It also grows among wheat; has a dull purple flower, and attains a hight of from six to twelve inches.

ANS.—It is probably Corn Cockle—Lychnis Githago (Gray) or Agrostemma Githago of some botanists. We have never heard it called "Old Maid's Pink."

J. H. B., Hawley, Minn., asks whether blueberries are likely to thrive in a dry prairie soil.

ANS.—Wild plants will not thrive in a dry, sunny position. Our only hope for cultivating the blueberry with success lies in the production of seedlings which may adapt themselves to the changed conditions.

R. F. R., Franklin Furnace, N. J., asks whether there is any paper that makes information with regard to iron and the market quotations therefor a specialty.

ANS.—Yes, several. In this city there are the Iron Age, weekly, $4 50, 10 Warren Street, and the Metal Worker, weekly, $1.20, 83 Reade Street.

W. J. W., Belmont, N. Y., asks where can he obtain reliable information about Southern California.

ANS.—We know of no better source of such information than the letters in our "Everywhere" Department during the last three years.

T. S. L., Blossom Hill, Va., asks where can Petunia hybrida flore-pleno be obtained, and its price.

ANS.—The price is 25 cents per packet of a few seeds. It may be found in several of the catalogues we have called attention to.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, APRIL 2nd.

S. H.—F. R.—A. B. A.—C. D., thanks.—W. J. W. S. B. P., Mich., thanks.—G. C. H.—L. B. A.—E. A. F.—S. H. W.—J. J.—O. H. P.—E. S. B.—L. R. S.—W. A. H.—H. THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, APRIL 9, 1881.

ACTING upon the instructions recently given in these columns, our young friends might now busy themselves in grafting. It occurs to us that as the currant is easily grafted, why not graft cions of the gooseberry and black and white currant upon the red, or the white and red currant and gooseberry upon the black?

SEVERAL printed documents have been sent to us by subscribers, to whom they had been sent by Orange Judd, documents written by editors in his employ, setting forth the eminent fitness of Judd for the position of Commissioner of Agriculture. The request or suggestion is made that the persons receiving these documents will write to the President supporting Judd's claims. Pretty business this!

TRANSPLANTING AND CUTTING BACK.—Whenever a tree is transplanted, many of the roots are injured—a part destroyed. Those that remain when set out in a new place are in no condition to feed the plant as it was fed previous to removal. Hence the top must be cut back to restore the equilibrium. Let us instance the case of a newly transplanted grape-vine. If many buds are permitted to push and grow, the growth of each at the end of the season will be found to be of a feeble, immature kind. If, on the other hand, but one bud be permitted to grow, a strong, healthy cane will be the result. Thus we see in the former case the sap is distributed among *many* buds and shoots, while in the latter it is supplied to *one*. The tree or plant of any kind may live in either case. While, however, cutting back renders the chances of life greater and insures more vigor, we have still to consider whether a few strong shoots are not more desirable than many feeble ones.

THE OHIO WINTER-WHEAT CROP.—According to the report of the Ohio Board of Agriculture just published, the winter-wheat crop has been injured much more seriously than previous reports intimated. Secretary Chamberlain, who has been traveling extensively through the State, reports that the condition of the growing crop is very critical. In many places entire fields have been winter-killed owing to the alternate thawings and freezings. Although the increase of acreage put under the crop last Fall is officially set down at five per cent., yet the yield of Winter wheat next harvest, Mr. Chamberlain thinks, will not be over 70 per cent. of the production of 1880—52,000,000 bushels. Our readers will remember, however, that many of the gloomy predictions made a year ago, with regard to the damage due to winter-killing of wheat, were happily falsified by the recovery of the sickly plants on the return of the genial suns of Spring, and it may be that our Ohio friends will be gladdened by a like agreeable surprise this year.

THE WORLD'S FAIR.

"To BE or not to be—that is the question." The feeling of uncertainty which lingers about the matter seems to be growing in intensity every day, and unless some greater progress is soon made, the time for holding the Exhibition had better be extended at least to 1884. We admit that it would be a little inconsistent with the characteristic "go-ahead-ativeness" of citizens of the Empire State to drop the matter entirely; but better a hundred-fold extend the time to such a date as would afford, not only our own nation, but those across the sea, ample time for preparation. Better have a good Fair in 1900 than a poor one in 1883. How do things stand at present? Gen. Grant, whose election to the presidency of the Commission gave quite a "boom" to the enterprise, has resigned and gone to the "wilds" of Mexico on personal business; no satisfactory agreement has yet been reached as to the site; the plan of taking Central Park seems to be abandoned and no better location is proposed; the finances of the concern, though encouraging, are not by any means in such a flourishing condition as they should be, and a general feeling of uncertainty pervades the community, save that portion represented by the indefatigable Committee. While our earnest desire is to have an Exhibition in 1883, if it can be assured, we would much prefer a postponement until a time when there can be no doubt of its success, and when not only New York but the whole country may do itself the highest justice.

FALSE ECONOMY.

THERE is a vast amount of false economy in business, and it has found its way to the homes of many of our farmers. True economy, not parsimony, is the basis of success, and this is as true in the farmer's occupation as in any other. The farmer who objects to giving his son a liberal education on the ground that he is going to be "nothing but a farmer," is putting into practice a most unwise and injudicious principle of economy. Such an one will not buy books, or take papers, which rightly perused, would give him great assistance in his work, simply because he thinks he "cannot afford them."

His poor farming tools are "good enough for him," though on every hand he witnesses the rapidity and thoroughness of the work done by improved machinery in the hands of truly economical farmers—economical because they choose methods by which they can do their work most quickly and, at the same time, most efficiently. The "economic" farmer wishes to make money, so he sells off entire those crops which, returned in part to his soil in the shape of manure, would make his land much more productive, forgetting that the soil needs a certain amount of food in order to produce. He disposes of his best calves and colts, because "being nicer they will bring a better price," and he retains the poor offcasts for breeders—a sure step toward ignominious failure in stock-keeping. The time is come when our best farmers are cutting loose from these misleading principles, and are taking broader views of things, and when this false economy should be superseded by the true.

SOMETHING FOR NEXT TO NOTHING.

ALMOST every week we publish in the RURAL notices of printed matter of various sorts, containing a great deal of interesting and useful information, which can be obtained by our readers either for the trouble of making application therefor by postal card, or at most, for a trifling pittance that often falls short of the cost of production. Reading matter of this kind includes catalogues of all sorts, pamphlets on various subjects, reports of State Boards of Agriculture, pomological and dairy societies and associations, as well as the annual reports of the Department of Agriculture and special reports published by it from time to time on various topics of current interest or importance. Many of these works are the result of a world of labor and research, and are replete with the latest and best information on the various topics they discuss. Others advocate one-sided views of particular subjects; but even these generally afford a good deal of serviceable information to the discriminating reader. Others again—and to this class belong the best sort of catalogues of seedsmen and nurserymen, and pamphlets of manufacturers of machinery and dealers in fertilizers—while advertising the goods offered for sale in them, give excellent advice and information as to the best methods of using and treating these. In view of the large fund of practical and interesting knowledge that could be easily gathered even from a choice selection of these in the course of the year, we strongly urge our readers to send for such of them as they may consider useful, judging from the notices of them that may appear from time to time in our columns.

INVESTIGATING OLEOMARGARINE.

JUST a year ago we had occasion to chronicle the festive trip made by a Congressional Committee to Baltimore and this city in compliance with an invitation to a "glorious" spread tendered them by the makers of oleomargarine in both places. After having been abundantly wined and dined by those interested in the concoction and sale of the conglomerate, the legislative junketers, having cursorily inspected the process of manufacture, paid for their entertainment by lavish praise of the product. This sort of investigation of "oleo' just suited the makers of the stuff, to whom the Congressional Committee gave entire satisfaction. The same cannot be said of the State Legislative Committee at present in session in this city to investigate the manufacture of butter from tallow and cheese from lard. This Committee seems resolved to get at the truth in the matter, not, like their predecessors, by a hasty visit to a factory cleaned up for their inspection, and a subsequent examination of the product at a banquet at which the manufacturers regaled them; but by a careful examination of those who are best able to afford correct information on the subject. Among the mass of information already elicited the public should know that sometimes the fat for the manufacture of the "butter" is extracted by melting at 100 degrees below the temperature necessary to kill animalcules in it; that frequently hogs that show signs of disease are hurried to market and "worked up" into cheese; that cotton-seed oil, pea-nut oil and alum are used in the process of coloring and clarifying the mixtures.

While we are hardly prepared to advocate such a bill as that lately introduced into the Missouri Legislature, providing imprisonment of not over one year and a fine of not over $1,000, or both, for any person convicted of making or selling any oleaginous compound designed to take the place of cheese or butter made from pure, unadulterated milk or cream, we certainly insist that such substances shall be sold for what they really are, and not be dishonestly palmed off on the public as genuine cheese or butter at the price of these products. The present investigation seems to have established the fact that fully four-fifths of the spurious "butter" sold here by retailers is bought as real butter, while a very large proportion of our exports of "butter" is, there is good reason to believe, composed of this concoction. The injury annually done to the dairy interests of the country by the trade in the various imitative compounds of lard and tallow, is estimated to have already reached the vast sum of from $50,000,000 to $75,000,000.

THE EUROPEAN OUTLOOK.

SOME of the most disastrous wars that have ever glorified rulers and afflicted mankind have sprung immediately from trivial causes, although in most cases unfriendly antecedent conditions prepared the way for the final outburst. When the magazine is stored with loose powder, a hardly visible spark will cause a destructive explosion. Between such a magazine and Europe there is a strong likeness to-day, and there would be little to wonder at should the flame from the first gun fired in the squabble between Greece and Turkey produce a conflagration that before its extinction in blood should envelop the whole of Europe. From the Mediterranean to the Arctic Ocean and from the Ural Mountains to the Atlantic, the whole Continent is a vast camp; the flower of the youth and manhood of every country is forced into its armies which, in the guise of the savior of the nation, is an incubus upon its industry and a menace to its neighbors. It has been well said that in Germany every tiller of the soil carries a soldier on his back, and small wonder that so many of the soldier-ridden peasants are seeking relief from their grievous burden on this side of the ocean. In France the increase of the already enormous army is the first consideration with the government—the object for which the people are grimly patient under a grievous burden of taxation. Though the Russian army, the largest on the globe, had no terrors for its emperor's assassins, its vast unwieldy, bulk and headlong, machine-like obedience are a constant threat alike to European civilization and Asiatic barbarism. The young Kingdom of Italy, with a load of debt already as heavy as that of many of its old neighbors, is still adding yearly to the oppressive burden to increase her fleet and her army. Thus of the five Great Powers, four are armed to the teeth, and straining all their resources to equip themselves still more destructively for—what?

Were there any truth in the paradox that a thorough preparation for war is the strongest safeguard of peace, the tranquillity of Europe would be assured for at least the present generation. But, apart from the fact that a nation completely equipped for a fight is likely to indulge in one on the first favorable opportunity, especially as the state of preparedness can only be maintained at enormous expense, there are other incentives to battle urging each country to contention. France, always the firebrand of Europe, is revengefully determined to recover the lost provinces of Alsace and Lorraine; Germany is equally determined to retain these unwilling sections of Teutonic nationality; Russia under a warlike young autocrat is not likely to forget her traditional claim to be the heir to the territory as well as to the religion of the Greek Empire; Italy is eager to assert her position as the latest accession to the Great Powers by battling either with Austria for Trieste or with France for Tunis. Great Britain alone, having just had a surfeit of one war in Asia and another in Africa, and having no special axe to grind during a European conflict, is genuinely anxious for a continuance of peace.

BREVITIES.

AT the April meeting of the N. Y. H. S, the culture of mushrooms will receive attention.

STRAWBERRIES of fair quality from Florida are selling to-day (4th) at retail, for $1.50 per quart.

ONE of the methods of Mr. Judd to influence President Garfield in his favor is set forth on page 246.

THE Yellow-Wood — Cladrastis tinctoria or Virgilia lutea—"bleeds" when cut as freely as any maple. We wonder if the sap has ever been tried for sugar.

IT may be observed that the Japan conifer named retinispora, is sometimes spelled retinospora. The former is the spelling adopted by Siebold and Zuccarini, the founders of the genus.

WILL our friends whose names appear in the list of mangel cultivators, in the RURAL of Feb. 26, please send us their addresses as soon as convenient. Only about half of them have done so as yet.

NOW, we believe, is the best time of the year to transplant evergreens. They may also be pruned now. If the lower growth is scanty, cut off the top of the leader and the terminal buds of all the top shoots.

THE plum and cherry should be grafted very early before the buds begin to swell. Pears and apples may be grafted even after the buds break if the cions have been preserved in a dormant condition. Grafting the peach seldom succeeds in the North—it is better to bud in late Summer.

OUR next original portrait of distinguished farmers or horticulturists will be that of Mr. C. M. Hovey of Boston, Mass. The next thereafter will be those of Messrs. Lawes and Gilbert, of Rothamsted, England. We have just received the photographs at the reiterated request of the editor of the R. N-Y.

LET bee-keepers take courage! Mr. Jones is the champion bee-keeper and lives at Beeton, Cal. In 1879 he obtained 75,000 pounds of honey from 300 colonies of bees, and last year he took $2,000 worth from his hives, although it was a bad year for honey. During 1880, he obtained 600 new colonies from 400, and he began the present year with 1,000 colonies valued at $7,000. With no drawbacks, he expects to clear from his bees this year $10,000.

WHILE young Spring and old Winter are contending for supremacy great is the uncertainty of the weather. Just a week ago the Signal Service Office, in a special bulletin, informed us that the season in Texas and the other Southwestern States was of average earliness; yet on April 1, another special dispatch announced that in Northern Texas, Tennessee, West Virginia and thence northward over the lower lake region, the temperature was below freezing point in the morning. In Northern Minnesota people still shivered in weather 10 degrees below zero.

THE Illinois Legislative Farmers' Club, composed of members of the State Legislature, among several other measures submitted to the House, relating to the control of contagious diseases among domestic animals, recommends the appointment of a State Veterinarian with assistants, with power to investigate all outbreaks of diseases, and in case of emergency to regulate the transportation of stock, etc. We are strongly of opinion that such a measure would be beneficial, and that it cannot be adopted too soon for the safety of the vast live-stock interests of the State.

HOWEVER great are the evils of the credit system in the North they are still more disastrous in the South and especially in the Cotton States; and before prosperity becomes assured among agriculturists there the pernicious practice must be abandoned. The usual method is for the planter or farmer to give the merchant a lien on his prospective crops, whereupon the latter, being fully secured, furnishes the needed supplies, fixing his own prices thereon. The planter is thus entirely at the mercy of his "factor," with no redress against exorbitant over-charges. The Supreme Court of Mississippi has just rendered a decision which should afford some relief from these exactions to the farmers of that State, and to those of other States should the precedent be followed there also. A mortgage on the crops of a planter held by a merchant was foreclosed by him. Although it was proved that the prices charged the victim were more than double cash rates, yet the lower Court gave a verdict in favor of the merchant. On appeal, the Supreme Court reversed the decision on the ground that in buying the goods the farmer was not in a position to decline them on account of the exorbitant prices charged therefor, and that he consented to take them at those rates through overruling necessity. His extorted consent to the prices fixed was therefore without consideration, and consequently void. "Pay as you go," is alike the practiced maxim of prudence, thrift and the RURAL NEW-YORKER.

Literary Miscellany.

LEISURE HOURS.

WHERE seek we first, the ruddy bloom of health?
A boon, without which none can boast of wealth.
Where, but among the happy, free and gay,
Where honest labor rules the livelong day.
Go, visit yonder farm-house on the green,
If it so happen you have never been,
To him whose pride is to hold the plow.
Go, in a Summer eve, near set of sun,
And when the well-planned, hard day's work is done,
See how the farmer and his rugged boys,
The wife and daughters, cherish life's rich joys,
Free from the cares that hinder or destroy
The calm delight of those who shun employ:
Behold his fields of richly-waving grain,
Moved by the breeze that sweeps along the plain,
See how they smile, kiss'd by the rosy lips
Of mellow sunbeams, ere the night's eclipse,
In shade just changing to a golden hue,
In every aspect beautiful to view.

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

(Continued from page 230.)

CHAPTER XI.

SOCIETY WITHOUT SOCIAL DISTINCTIONS.

In the tower of every church throughout the city a wonderful clock was placed, which not only struck the hours of the day but indicated to the inhabitants the time of every duty. Thus, at half-past five in the morning the clock set a bell ringing, which was intended to rouse the people from their slumbers. At seven o'clock another bell indicated the hour for breakfast. At eight o'clock the business bell proclaimed the time for opening stores, and entering on the various pursuits of the day. At twelve o'clock the lunch bell rang, which also marked the hour for closing business. After lunch the people devoted themselves to various intellectual occupations. The gymnasium bell sounded at four o'clock, which called the people of both sexes and nearly all ages to the several gymnasia connected with every park. At five o'clock the bell which announced the hour for dinner rang. And at six another announced the evening business hour, when the stores were opened till seven for the accommodation of the public. The bell which called the people together for two hours of social enjoyment at the parks was rung at seven. And, finally, at nine those delightful chimes sounded, which, with the hymn of praise that rose simultaneously from every quarter of the city, fittingly announced the fact that the labors and pleasures of the day were ended.

There were, of course, occupations in which it was necessary to vary this routine.

CHAPTER XII.

HOMES OF STONE AND ART.

As I spoke in the last chapter of my needless alarm over what I took to be a summons to a fire, I may say here that the destruction of property by fire was a thing quite unknown in this country. Not only were the houses completely fireproof, but the conveniences of life among this people were so perfect, and they themselves were so habitually prudent and cautious that danger from fire was entirely precluded.

The stone-like appearance of the houses which I have spoken of as representing buildings chiseled from the solid rock, was not confined to the outside, but extended throughout the interior. The floors, ceilings, walls, balustrades and even the doors and windows had the appearance of being the laborious work of the skillful sculptor.

This stone-like material, which if I remember rightly, was called blisten, was of the consistency of mortar or cement when applied, but much tougher and more cohesive. It was capable of being pressed into moulds, and at a certain stage of its hardening it could be cut like chalk, so it was an easy matter to fashion it into any desired form, and when once hardened it was even more durable than marble itself. Its nature made destruction by fire impossible.

The houses were built most substantially of a sort of corrugated brick, two feet long and a foot square, which were laid in this substance, and which it bound together with a tenacity that was even greater than the cohesion of their own particles; for it was easier to break them in pieces than to separate them from one another when once the blisten had become thoroughly hardened. When the wall was built up, it was faced with the blisten after the manner that our houses are plastered, but with machinery which accomplished the work in a much more rapid and artistic manner. The coloring of the particular stone which it was desired to simulate was transferred instantaneously to the whole side of the building before the blisten became dry, by an instrument which resembled the *camera obscura*. A chemical substance was then cast over the building in a fine spray, which seemed to burn in, as it were, the coloring which had been transferred to the blisten so as to make it appear a part of its very nature, giving to it at the same time a hardness and polish which made it resemble the laborious work of the lapidary.

The interior of the houses, the floors, etc., were constructed out of a porous sort of wood, over which was spread a coating of blisten, prepared somewhat differently from that upon the outside, which sank into the pores of the wood, and almost completely changed it to stone. At least it became incorporated with its substance to such an extent that it never cracked or broke off without the wood cracking or breaking with it.

The decorations of this material in the interior of the houses were wondrously varied and beautiful. The floors were uncarpeted and were made to resemble mosaic work of the highest order of richness and beauty. The ceilings of the more important rooms were elegantly frescoed, and the walls were covered with portraits and paintings executed in the highest style of art. Being very practical in their habits, I wondered where these people found time to execute such marvelous works of art; for not only was every house profusely adorned, but the excellence of the work seemed to indicate that time and faithful labor were essential elements in its execution. I was told in reply that houses in this country were built to withstand the power of time for a thousand years or more. The decorations in the older houses, therefore, represented the accumulated work of centuries. One member or more in nearly every family possessed artistic talent, and devoted much time to art; thus, in the course of time the home became a storehouse of most excellent works.

The character of these art productions was various, and they were adapted with rare skill to their surroundings so as to produce the highest artistic effect. Thus twining around a pillar, there would be a skilful representation of a species of clematis, or on each side of a door a flower-pot would seem to be placed, from which an ivy would appear to grow up the posts, in a most naturally graceful manner. Above the center of a richly-carved mantel, a dish or basket of fruit would be placed, and at either end a rare plant would grow from a richly-gilded or carved pot so naturally as to appear to give its very aroma to the air. Nearly every available space was occupied by some work of art whose character made it appropriate to the position which it occupied, and thus every house was a picture gallery of the most varied and well-executed works of the painter's art.

In Mr. Flyter's dining-room there was a picture of a feast which occupied the whole wall at one side of the room. It was an exact representation of the members of the household when his great-great-grandfather was at the head of the family, and he himself was yet unborn. I expressed my surprise that there should be so little change in the style of dress and the general appearance of the people since the remote day when the picture was painted. I was told in reply that styles of dress had not changed materially for hundreds of years, and that I would have to consult pictures of a thousand years of age to find much of the antique. The people of that day were regarded as only in the dawn of the higher civilization of the present. They were puny and sickly in appearance as compared with their descendants, and there was a want of intellectuality, and a hard, narrow, shrewd, and selfish look about them which contrasted most unfavorably with the splendid physical, moral, and intellectual manhood of the people of the present.

This progress from a lower to a higher type of manhood was well indicated in the family portraits to which a room in every house was devoted, and which extended back in an unbroken line in some instances for thirty generations. An interval of ten generations gave a very perceptible increase in physical vigor, manliness, intellectuality, and refinement of expression. But when one came to compare the first portrait with the last in the line; every feature and expression which is noble, grand, and exalted in our nature seemed to have pushed itself into prominence in the last, and to have crowded completely out of sight those marks of littleness and incompleteness in their physical and mental natures which were a prominent characteristic of the first.

The names, and the dates of birth and death of the original of each portrait were placed beneath it. And it was not the least instructive of the lessons which I drew from my study of these ancestral pictures that there was a general increase in the age to which these worthies lived as they advanced toward a more perfect type of manhood.

Mr. Flyter's portrait gallery contained the pictures of his ancestors for 350 years. That of his brother-in-law, Mr. Glinden, represented his ancestry for over a thousand. Mr. Glinden, by the way, was one of the few antiquaries which could be found among this people. And he was accustomed to say that he owed his taste for the study of the ancients to the picture of a battle-scene copied by one of his ancestors many hundred years before from a masterpiece which was then regarded as very ancient."

ROCKERIES—AFTER THE LONDON GARDENERS' CHRONICLE—SEE PAGE 241.—FIG. 196.

This battle scene was the only one in existence in the country, and, though so rare, it was little prized. In fact, his neighbors were accustomed to remark good-humoredly that it was an evidence of a perverted taste in Mr. Glinden to harbor such a useless and even degrading work of art. But he was an antiquary, and prized it for its antiquity and for the vivid representation which it gave of a feature of life among the ancients.

I was surprised to learn that there were so few students of ancient history among this people; for Mr. Glinden informed me that there were but three beside himself in that great city of ten million souls who were at all familiar with the history of their early ancestors.

"Our people," said he, "are so unmeasurably in advance of the nations from which they sprang that they can learn nothing from their history which is profitable; and their minds are so completely occupied in keeping pace with the rapid strides of science, and the continual advancement in art and literature that they have no time to devote to studies which they think merely gratify an idle curiosity."

This view appeared to me rather novel, for among us the study of history is considered no less profitable than entertaining. But when I came to think it over I could not but regard it as just; for wherein could the records of wars, carnage, pillage and devastation prove useful or even entertaining reading to a people who loathed all violence with a deep abhorrence. Or of what advantage could the study of the manners, customs and institutions of an age whose history was stained with every species of crime and fraud, and which was a record of selfish and narrow-minded contention over questions of religion, science and government be to a people among whom crime and deception of every sort were unknown, and every social problem had been as satisfactorily demonstrated as the rudiments of mathematics. Such studies could be profitable to this people only as they taught them humility by reminding them that even in their exalted natures the germs of a depraved humanity existed.

But to return to the art decorations. In Mr. Glinden's house there were several rooms devoted to the pictures of extinct species of animals. This was a very rare collection because of its extent, its character, and the skill with which the work was executed. I returned to it and studied it over again, and not a little of the interest with which it was invested to my mind was due to the fact that it contained many animals which still flourish among us in pristine vigor; such, for instance, as the bear, the wolf, the deer, the fox, the lion, the tiger, the elephant, and, strange to say, even the pig figured among them in all the glory of his many generations of development.

But by far the grandest pictures which I saw among this people were those of their churches. Here the best artists seemed to have combined their efforts on works whose magnitude would seem to have required the patient labor of many generations.

The churches were all immense and elegant structures capable of seating from seven to ten thousand people. Their auditoriums were invariably spanned by a great dome whose magnificent sweep afforded a surface for the grandest conceptions of the artist's genius. Lighted from above and at each end, the side walls were left unbroken for magnificent landscapes executed with such a realistic effect that one was disposed to wonder why he could not hear the sound of the waterfalls or see the boats moving along the streams, or the animals disporting themselves on the hillsides. And he was inclined to long for the conclusion of the services that he might walk abroad in the green fields and enjoy the peace and quiet of the rustic scene which seemed to stretch away from his very presence.

There were many other decorative arts which flourished among this people, some of them entirely unknown to us, in as advanced a stage as the art of which I have spoken, but I will not dwell upon them lest the many other things which I wish to speak of may be more than enough for the readers patience.

To be continued.

MAGAZINES FOR APRIL.

VALUE OF THE HOUSE WREN AS AN INSECT DE-

STROYER.—Ornithologists and Entomologists are always most properly and sensibly urging upon people the duty and necessity of protecting the birds. In fact when any destructive insect appears in overwhelming numbers, the good offices of our feathered friends would seem to be almost our sole dependence for protection from their ravages. And yet our laws and usages are singularly defective, regarded simply from a selfish point of view—leaving humanity entirely out of the question But the matter is constantly forcing itself upon public attention, and gradually we shall make laws which ought to have been upon our statute books from the foundation of the Government. In the meantime let us all, who have this subject at heart, keep on "preaching" until this glorious end is achieved. The observations I have been able to make during a residence of several years on a farm have convinced me that the common house wren is really one of our most valuable birds, not, perhaps, for what they have done, but from the possibilities wrapped up in their diminutive bodies. They are quite as social as the purple martin or the bluebird, and greatly surpass both of these in the rapidity with which they increase. I began several years ago to provide them with nesting-places in the vicinity of my buildings. Sometimes I fastened the skull of a horse or ox, or a small box, in a tree top. But latterly I have made it a practice every Spring to obtain thirty or forty cigar boxes for this purpose. If the box is long and large, I put a partition across the middle and make a hole through into each apartment. It is very seldom that these boxes are not occupied by one of these little families. In most instances two broods are annually reared in each nesting-place. One of my boxes last season turned out three broods of young wrens —six little hungry birds each time, or eighteen in all! I think a cigar box never before did better duty.—Am. Naturalist for April.

THE ATLANTIC MONTHLY.—Contents: The Portrait of a Lady, XXI.-XXIV.; Concerning Dead Love; What we Learn from Old Aryan Words; The Longing of Circe: Friends, a Duet; Voltaire's School Days; The Wives of Poets, IV.; Her Ghost; The New Sunday; Sonnet; Reminiscences of Washington, XI.—The Fillmore Administration, 1850-1853; Secrets; The British Philistines; Johnson's Garrison, and other Biographies; The Last State of English Whiggery; A Century of Dishonor; Two German Novels; The Contributors' Club; Books of the Month.

ENGLISH IGNORANCE OF AMERICA.—One striking trait of British Philistinism is ignorance of other countries, and chiefly ignorance of America. To the Philistine this ignorance is his most cherished intellectual treasure. He guards it carefully, and plumes himself upon it. To enlarge and confirm it, he reads the travels of other Philistines in America, and in some cases visits the States himself, to return with a confusion of mind and perversion of fact upon the subject which is the occasion of profoundest self-congratulation, and which makes him for the remainder of his life an oracle upon American affairs among his untraveled friends and neighbors. Let me frankly confess, however, that a like ignorance and confusion in regard to England among natives of other countries is sometimes courteously assumed by the Philistine. Some years before my visit to England a pretty sweet-mannered, although not very high-class, Englishwoman was telling me, with the eyes and the voice of a dove, of something that had happened in Manchester; and then with gentle condescension, she added, inquiringly, "You 'ave 'eard of Manchester?" I said that I had, and she was satisfied. There are little courts and alleys in London which are called mews; and I was kindly informed by one or two friends, as we passed some of them, that mews were places for the keeping of hawks in olden time. It was impossible even to laugh at instruction so kindly given; nor did I tell my good teachers that any school-boy twelve years old in America knew that as well as they did. The elegant and very clever woman who recommended me to read Kenilworth before going to see the castle displayed this same sort of Philistinism. What need of telling her, either, that school-boys in America read Kenilworth!—Richard Grant White in April Atlantic.

FIG. 198.

INDIAN EDUCATION IN VIRGINIA.—The effort has been for a natural, all-round growth rather than a rap'd one. Books, of course, are for a long time of no avail, and object-teaching, pictures and blackboards take their place, with every other device that ingenuity is equal to, often on the spur of the moment, to keep up the interest and attention of the undisciplined minds that, with the best intentions and strong desire to know English, have small patience for preliminary steps. A peripatetic class was thus devised to relieve the tedium of the school-room and had, to speak literally and figuratively, quite a run. It usually began with leap frog, and then went gayly on to find its "books in the running brooks, sermons in stones," etc. Geography is taught with molding sand and iron raised dissecting maps; arithmetic at first with blocks. The Indians are particularly fond of each, and the advanced class is quite expert in adding up columns of figures as long as a ledger page, and equal to practical problems of every-day trade and simple business accounts.—Helen W. Ludlow, in Harper's Magazine for April.

OUR LITTLE ONES.—Contents: The Rain-Wagon; Fruits of the Tropics; Willie's Carrier-Pigeon; The Robin's Song; The Bright Cent; A Good Fit; A Sail in a Tub; "Rats!" The First Snowdrop; What a Big Man am I! The Light-house; So Strange! The Shepherd; What I do Every Week; Bobby's Blunder; The Spider and the Wasp; What Sammy's Monkey Did.

This is one of the prettiest magazines of its kind that we have had the pleasure of seeing. The literary portion is appropriate and the illustrations finer than usually presented for childish appreciation. Every article is accompanied with an illustration.

O. JUDD'S ENDEAVORS TO BE THE NEXT COM. OF AGRICULTURE.

Thousands of Circulars Sent About the Country Soliciting People to Write at Once to the President Indorsing him.

THE following is one of several letters that have come to us inclosing certain documents which Mr. O. Judd is circulating about the country:

EDITOR RURAL NEW-YORKER, 34 Park Row, New York.

SIR:—The inclosed circular which I received today, explains itself. I presume hundreds of thousands of them have been distributed. I think I "smell a mice." No wonder the A. A. has so much fault to find with the Department and with Le Duc. I would suggest that you mail this circular to the President, if you have not already. It will show him how peculiarly fitted Mr. O. J. is to pull the wires. Respectfully,

Waverly, N. Y., March 25.

We make the following extracts from one of the circulars referred to:

NEW YORK, March 25, 1881.

DEAR SIR:—You doubtless well know that the Department of Agriculture at Washington has thus far been of little use, often worse than useless, to the farming interests of the country. A number of very intelligent farmers and others interested in agriculture have urged Mr. Orange Judd to allow his name to be presented for the place of Commissioner of Agriculture, to act at least until the Department could be re-organized and placed on a better basis. . . . . .

Word has just come to me from Washington that the President seems disposed to make such appointment if it is desired by the more intelligent farmers and others of the country.

If you agree with me in the opinion above expressed, will you please write *at once* a brief letter to the President of the United States, Washington, D. C., telling him in your own way that you recommend (highly, strongly, or otherwise, in your own words) Mr. Orange Judd of New York, for Commissioner of Agriculture and request him to make the appointment. Also get as many others to write, or join you in writing, as you readily can. It is preferable that the requests come directly from the people in their own language.

As several persons, in my opinion, wholly unfit for the place, are strongly pushing for the appointment, who claim it as a "reward for political services," and are using all sorts of political influence to secure it, it is highly desirable to have the above request go forward from *yourself without a day's delay*. Respectfully,

GEORGE THURBER, Editor, etc:

We have no comments to make upon the above and are quite willing to aid Mr. Judd in its further circulation.

A dramatic editor of a French paper had occasion recently to criticise severely the performance of a somewhat popular actress. Shortly afterwards the lover of the young lady met the journalist in the theater, and presented him with a package of goose-quills. "This, sir," said he, "is a present from Miss X." "What!" exclaimed the critic, "did she tear all those out of you herself? How you must have suffered!"

For Women.

CONDUCTED BY MISS RAY CLARK.

DESCRIPTION OF CUTS.

FIGS. 197 & 198—SLEEVELESS JACKET: CROCHET.

Materials required: Three-quarters of a pound black double Berlin wool, one ounce scarlet Shetland, bone hooks (Nos. 9 and 13.)

This jacket is suitable and comfortable to be worn during the cold weather under the loose cloaks that are now so fashionable, and no difficulty will be found in shaping if a paper pattern is cut the exact size, and the work placed upon it from time to time, to see where the increase and decrease is necessary. The pattern should be cut to fit tightly, as crochet stretches very much. The jacket consists of four pieces—two for the front and two for the back; it is worked lengthwise; only one pleat is necessary to form the waist. With the Berlin wool and hook No. 9, four stitches and three worked rows form an inch, so that no difficulty will be found in calculating the number of stitches required. Commence at the armhole with twenty-five stitches for an ordinary-size jacket.

1st Row: One double into each of the chain-stitches one chain, turn.

2nd Row: One double into each of twenty-six stitches, one chain, turn; continue to work in this way, increasing one stitch at the end of every row, until you have worked down to the waist, then work as many chains as are required to reach the bottom of jacket—about thirty stitches will be required; work on all the stitches, still increasing

FIG. 199.

one in every other row at the shoulder until you have worked to the top of the slope, which is in all about fifteen rows.

Now commence the fancy pattern which simulates the square collar, and is worked as shown in the pattern Fig. 198. When within eleven stitches of the shoulder, work with the Shetland and Berlin wool together two trebles into each of two stitches of the last row but one, one double into each of six successive stitches of last row but one, one double into next stitch of last row. The following is a plain double row:—

In the 18th row: Work the pattern to simulate the collar as described in the 16th row, beginning the pattern eight stitches nearer the waist.

19th Row: Double.

20th Row: Like 18th row.

21st Row: Double.

22nd Row: Like 18th row.

23d Row: Work thirty double stitches only below the waist.

24th Row: Twenty-five doubles.

25th Row: Twenty doubles.

26th Row: Fifteen doubles.

27th Row: Ten doubles.

This finishes the half-back of jacket. The second half is worked to correspond.

The fronts are begun at the edge, and worked towards the side with the pattern shown in figure 197.

Make a chain the length required.

1st Row: One double into every stitch. Work as directed for the collar, with pattern shown in Fig. 198 until you have five rows worked.

Continue the pattern, increasing one stitch for the throat at the end of every other row.

To shape the waist, pass over twenty-four stitches in the waist without working, work on the upper stitches to form the bosom of jacket,

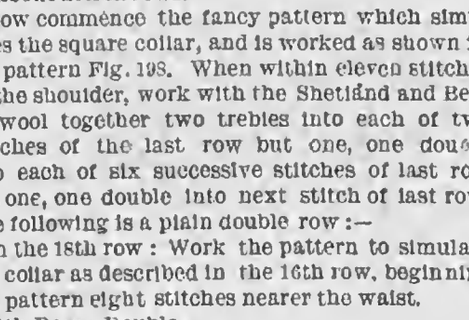

FIG. 200.

and the lower for the basque. Commence each row four stitches farther from the waist each time, so that the plait may be gradually shaped, until you have seven pattern rows in the widest part; then work straight down with one double into every stitch, decrease one stitch at the beginning of every row to slope the shoulder and basque, until you have the width required at the waist; work the bottom of this piece as described for the bottom of back. The other front is worked in the same way, but take care to keep the fancy pattern for the opposite side.

Sew up the four parts on the wrong side with a needle and wool; three rows of point Muscovite are worked round the jacket and armholes. Point Muscovite is worked as follows:

1st Row: One double into a stitch, draw up a loop through next stitch, three chain. Repeat from the beginning of the row.

In the next row work up the three chain through the double, so that it comes between two loops on chain of last.

To make the button-holes up the right side of front; when working the second row of point Muscovite, instead of working the chain into the last row, work two chain, pass over two stitches, and continue the pattern into the next stich; eight button-holes are required. A crochet edge is worked thus round the outline of fancy pattern on the bodice, and round the armholes one double into a stitch, four chain, one treble into the first, pass over two stitches, and repeat.

FIGS 200 & 201.—LETTER-CASE.

LETTER-CASE. FIG. 201.

This case is made of dark ruby plush, cut in one piece, measuring eighteen inches in length and five and a-half in breadth; the ends are turned up to form pockets three and a-half inches deep; the flaps measure two inches deep; they are of gold-colored satin to correspond with the corners; an embroidery design is worked on one flap; the case is edged with ruby and gold cord, and is tied with a fancy ribbon.

FIG. 199—CUSHION-COVER: EMBROIDERY.

This cover measures eighteen inches square; the foundation is dark ruby plush; the embroidery for the corners is worked with crewels on silk canvas, which is appliqued to the foundation under embroidered bands of moire ribbon; the cover is finished by a tassel-fringe with netted heading,

FIG. 202—ROMAN APRON.

The apron is of crash, embroidered with cross-stitch border in green and blue silk; the ends are finished with fringe, made by knotting lengths of silk into the material, and the apron is tied behind with wide ribbon.

MRS SENATOR LOGAN has never tasted wine; at a dinner given to Prince Arthur, some years since, she declined it, and at the recent lunch of a cabinet lady she was the only one of twenty-five who was abstinent. She has brought up her children to share her feelings in the matter.

NOTE.—The usual amount of space allotted to women has again been encroached upon, and the question arose:—Cuts or no cuts—more or less matter? We have decided to put in practice the motto, *Multum-in-Parvo* and thereby please varied tastes. R. C.

CORRESPONDENT'S CORNER.

THANKS—I for one return thanks to Mary Wager-Fisher, for the hint in the RURAL of January 8, concerning scraps of silk and velvet, and how to utilize them. As for silk and velvet I had none, but I had a bag of scraps of flannel; of these I

FIG. 202.

made a spread for my lounge to protect it, for the children love to play on it these cold days. Besides being useful it is very pretty. MALINDA.

I AM thoroughly interested in the RURAL NEW-YORKER, have read it more or less since my childhood, and write asking for information. I will be as brief as possible. In the issue of March 19th, Mary-Wager Fisher gives some of the best of advice to girls, but one thing is left out; she speaks of possessing a cultivated voice, a well-stored mind, and the ability to express one's self fluently and elegantly. I would like to have her explain what is necessary to possess such a voice, and what books she would recommend to a mind not well stored. Many who have become mistresses of households desire to make the best possible use of the few spare moments they have for reading and improving, and also wish to urge their children to do the same. Yours with respect,

Lake Co., Ohio. IMPROVEMENT.

CAN you favor us with designs for the border of rag mats; they would be very useful and are often inquired for. A. J. C.

We confess ignorance and refer the above to our RURAL sisters, some of whom, no doubt will be able to give description. R. C.

WILL you tell me how to renovate black silk?

MRS. W. V. A.

There are several ways of renovating black silk. One is to dip in a solution of coffee, and press with a warm (not hot) iron, on the wrong side; another is to dip in a weak solution of ammonia, and press as above. Still another is to sponge with weakened vinegar. The sponging in any case is better than dipping, but of course not so quickly done. R. C.

Read of, procure and use Hop Bitters, and you will be strong, healthy and happy.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

A NEW COOKING STOVE INVENTED BY A WOMAN.

MARY WAGER-FISHER.

Has it ever occurred to women that the ordinary cooking stove or range is uncomfortably, incoveniently and needlessly low? that longer legs would improve it?. Mrs. Amelia Lewis, an Englishwoman (she deserves to have been born a Yankee), has invented and put npon the market a cooking stove that appears to be so superior to the arrangements now in use as to supersede them all. And for three reasons—its better adaptability to cooking, its low first cost and the small expense of fuel it consumes. I think, as a gormandizer of wood and coal, the cooking stove and range, as now constructed, yield the smallest amount of heat that is utilizable of any machine in existence. Every thonghtful housewife must have thought the same thing many times over. One of my neighbors who has a range in her kitchen, actually was obliged, a year and a half ago, during the mild Winter, to buy a stove to put in the kitchen, the sole office of which was to keep the cook warm. I think Philadelphians, much more than the New Yorkers, utilize the heat of their stoves. They use more pipe, and put drums in rooms, so that by the time the chimney is reached there is not much heat left to be wasted on the air.

Mrs. Lewis's stove stands high on three legs, has a cross-piece underneath which serves both as a "stay" for the legs and a shelf upon which to put pots and skillets. The stove stands out free in the room so as to be accessible from all sides; it has perforated ears at each end, in which pokers may be stuck. All the cooking utensils are of tin, and of Mrs. Lewis's design, mostly, and all have closely fitting double covers. Things that are commonly boiled are steamed instead. And, *apropos* of steaming, too much cannot be said in its favor. At the outset of my housekeeping I had a steamer constructed to fit in a small iron pot. It is about sixteen inches high, eight inches in diameter and half way up the cylinder is a cross-piece of perforated tin which rests on ears and can be removed at pleasure. The object of the cross piece is to divide the steamer so that two different vegetables or articles of food may be steamed in it at the same time. It looks like a section of tin stove-pipe with a cover on one end, but it is indispensible and takes up very little surface room on the range. It could be made three-storied as well. Mrs. Lewis's stove has no "oven." The baking is done on the top of the stove, the baking tins being placed on slightly raised wire stands, and the whole covered with a hood of sheet-iron made double with a space between the sheeting for the passage of hot air. The baking pans that come with the stove are of tin with a cover fastened on like the lid of a trunk, to be raised and closed in like fashion. Although the Lewis cooking utensils seem admirable, it is not probable that any "Bridget" would take to them kindly, or to the stove either. But for intelligent woman the entire arrangement would be one of exceeding interest and pleasure. The smallest size of stove for a family of seven costs fifteen dollars and the furniture twelve more. But any stove furniture except the ovens can be used on it. It is claimed that the amount of fuel required for it is but half that needed for the ordinary stove.

I suppose that all housekeepers who hire domestics, have a similar experience in regard to the use of machinery and of improved cooking utensils by the "cook," who, of all hired help, is usually the most "pig-headed." I believe that the housekeeper who is a strict and methodical disciplinarian invariably gets the best service out of her help, and the use of improved utensils and improved ways of cooking and of work may speedily be brought about by a firm insistence on the part of the mistress.

MAKING MAPLE SUGAR.

As the season for sugar-making is at hand, I thought perhaps a few suggestions might be welcome to some of the young people. As I have had long experience and practice I think I know something about it and what is needed to make nice maple sugar. The first thing is perfect neatness—perhaps cleanliness is a better word. Buckets, pans, strainers, and boys or men, all need to be perfectly clean. No danger but what we shall get our "peck of dirt," without having it served up in sugar! With all care, there will be bits of bark, dead leaves, and dry moss in the sap-buckets, and if these are boiled up in the sap, they will give a bad taste as well as a dark color to the sirup. A strainer made of coarse linen toweling, sewed up like a bag, and sewed at the open end over a tub hoop, is what is needed to strain the sap into when first gathered. Of course, there will be floating mites from the arch, that will fall through the boiling pan and with the most thorough skimming there will be particles of scum that will flo at in the sirup, so it is necessary to run this, when it is ready to take off, through another strainer made just like the sap-strainer. The sirup ought to settle overnight, or at least twelve hours, then have ready a flannel strainer, and pour off the sirup from the cans or pails very carefully, so as not to disturb the niter that has settled at the bottom. It can be strained into the sugar pan, and is ready to set on the stove. Some years there is much more niter in sap than others. If there is a great amount of it in the sirup, let the latter come to a boil, remove the pan from the stove, and pour in a quart of pure sap, stir it thoroughly and let it settle for two or three hours; then pour the sirup off into pails, and you will be astonished to see the quantity of grit or mites that remains. Now drain, and rinse out the sugar pan, pour back the sirup and set it over the fire. Keep it well skimmed and there is no need of any further cleansing. When it boils up in large blubbers it is nearly done, and great care must be taken lest it scorch. You can test it by putting a few spoonfuls into a saucer, and stirring it. If done, it will granulate quickly, and become hard Take the pan from the fire, and with a wooden paddle stir it slowly. If you wish to cake it, have your tins ready, and when it it as thick as hasty-pudding dip it into the dishes or molds and let it stand till cold. If you wish to have a fine, dry sugar, keep stirring till all the lumps are broken up, and it is a mass of fine-grained sugar This is the nicest kind of sugar, but it is a deal of hard work to stir it. Another way to prepare it is:—when ready to cake, dip it into tubs and let it stand till cold; then with a knife or spoon, scoop out a cavity in the middle of the tub and all the moisture will drain down, and the edges around will be a nice white sugar. If you wish to bottle up sirup for table use or put it into cans, it only needs to boil about ten minutes, then set it off from the fire and when cool enough not to break the bottles, put it in them, fill them full, and let cool till the steam ceases to rise, then cork tight and dip in a resin and tallow cement, and set in a cool, safe place in the cellar and you will have beautiful sirup for the table all the year. The first runs make the best flavored sirup and the later ones are just as well to cake or drain.

I know there are a great many improvements in sugar-making but I do not think sugar "done off" in an evaporator, is as sweet or delicately flavored as when the sap is siruped off in large pans. I think it is desirable to preserve the maple flavor, as that is what is expected. Above all things, be particular to keep cleanliness in mind during the whole process. Cinders, flies and gnats do not improve the article, or add to its value. Use the kind of apparatus you choose, but *do* be neat about it. GRANDMOTHER.

Robbin's Washer.

You ask your readers to give their experience with Robbin's Washer and Bleacher. We have used two of them within three years, and have had the same trouble with them that you complain of, viz.: rusting the clothes. We have no fault to find with the working of the machine other than this. It is the nearest to a labor-saving washer of anything that I know. If the manufacturers could overcome that difficulty it would be a great success.

Tremont Co., Iowa. A. C. GASTON.

QUESTIONS ANSWERED.

Asparagus and Celery.

M. P. BURTON wishes recipes for cooking the above vegetables.

Asparagus, Boiled.

ANS.—Cut the stalks of equal length, rejecting the woody part and scraping the white part which remains. Tie into bunches with tape, or in a piece of coarse net and put into boiling, salted water. Boil from 20 to 35 minutes according to age. Before it is done toast a few slices of bread, dip into the liquor in which the asparagus is boiling, butter and lay in a hot dish. Drain the asparagus, until the bunches and place upon the toast with a few bits of butter. A favorite accompaniment to boiled asparagus is a white sance as follows: Two ounces of butter, one ounce of flour, a small teacupful of milk, two tablespoonfuls of cream and a teaspoonful of salt. In a saucepan mix the flour and butter, add by degrees a half pint of boiling water. Stir until the mixture boils, add the milk, boil two minutes longer, season with salt, take from the fire, stir in the cream and pour over the asparagus, or serve in a gravy boat. A tempting way of serving plain, boiled asparagus is as a

Salad.

Boil, until carefully, place upon a flat dish and make very cold by standing in the ice-box. Serve with a dressing of vinegar, pepper, salt and salad oil.

Asparagus and Eggs.

When eggs are plentiful prepare in this wise. Cut as many tender stalks as you will need into half-inch bits, boil in salted water 15 minutes, drain, pour over a cup of rich drawn butter and turn into a buttered pudding-dish. Break a half dozen eggs, or as many as required, carefully over the surface, strew over bits of butter, season with salt and pepper and put into a quick oven until the eggs are set. Serve at once. Or make an

Omelette.

The green part only of a good-sized bunch of cold, boiled asparagus, a half dozen eggs beaten very light, two tablespoonfuls of milk and a little salt. Chop the asparagus very fine, stir in the beaten egg and milk. Put a tablespoonful of butter into a frying-pan, heat and pour in the mixture; shake and loosen with a broad knife as it forms. Fold over in the middle and turn upside down upon a hot platter.

Stewed Celery.

Cut into inch lengths and stew until tender. Drain off the water, and just cover with sweet milk. When it begins to boil, thicken with a lump of flour and butter rolled together, season with pepper and salt and boil a few minutes longer. After adding the butter and flour you may, if you please, add two well beaten eggs. It is best to first mix a few spoonfuls of the hot thickened milk with the eggs to prevent curdling.

News of the Week.

HOME NEWS.

MONDAY, April 4, 1881.

THE past week has been an unusually exciting one at Washington. Mahone, the Virginia "Readjuster," made a speech vindicating the position which he has taken in acting with the Republicans, though elected as a Democrat as his supporters supposed. The very equal division of the Senate between the two parties makes his vote of great importance. He administered, in his speech, most scathing rebukes to his assailants. The President, too, has been arousing the indignation of certain leading senators by his recent appointments, that of Judge Robertson to be Collector of the Port, in this city, being the "bone of contention." This was a slap in the face for the Conklingites and a soothing caress for the followers of the new Secretary of State. A simple turning of the tide from the five Conkling appointments of the day previous.

In view of the fact that Mr. Jewett declined the position of President of the World's Fair Commission, the committee have decided to take no further action in relation to a permanent President until after April 15, when the Finance Committee will report the subscriptions to the capital stock as provided for in the resolution of March 16. Mr. Cyrus W. Field is mentioned for the head of the Commission. California has appropriated $5,000 to represent the State at the Exhibition.

The quantity of goods smuggled into this country by persons claiming to be respectable, is enormous. Women and men dress themselves for the first time in new garments, and carry in their hands new umbrellas, canes and parasols, and, sling over their backs new opera or field glasses, and other articles, when about to leave the steamer, and the custom officers are helpless.

A meeting of the directors of the Mexican Southern R. R. Co. was held in this city last week. Among those present were General Grant, Russell Sage, Jesse Seligman, Frank Work, U. S. Grant Jr., and General G. M. Dodge. The following officers were elected: President, U. S. Grant; Vice President, G. M. Dodge; Secretary, James H. Work; Treasurer, Russell Sage. An executive committee was also elected consisting of Jay Gould, Frank Work and Russell Sage. A resolution was adopted requesting General Grant to proceed to Mexico with a view to representing the interests of the company in that country. He left on Monday.

Mrs. Mary N. Bliss, of Columbus, Ohio, has given $10,000 to Kenyon College for the building of a new hall to be called "Hubbard Hall," as a memorial to her deceased brother, George Hubbard. The hall is to contain a gymnasium, offices for the President and Vice President, and the Treasurer, and a lecture and apparatus room for the Professor of Physics.

There has been another disastrous flood in Nebraska, near Omaha. The river Platte overflowed the level prairies in the Platte Valley for miles around. A mile and a half of the Union Pacific track has been washed out, and the $50,000 bridge at Columbus was carried down stream. Several hundred thousand dollars worth of property have been destroyed.

The town of Green Island, Neb., opposite Yankton, has been swept away by the flood. The inhabitants could be seen from Yankton clinging to their houses as they floated off. A large amount of stock is supposed to have been drowned. All the bottom lands, which are well settled, are flooded. The flood at Bismarck, Dakota, came so suddenly that the people were glad to get to the bluffs with clothing enough to keep warm. About four thousand people were rendered homeless, but the water has fallen so that many buildings are now out of water. The total loss is estimated at from $150,000 to $175,000.

The reduction in the public debt for March is $6,192,819, and for the nine months ending March 31, $68,408,702. While the reduction for the month is less than one-half what it was for March, 1880, the aggregate reduction for the nine months is nearly $22,000,000 greater than for the corresponding nine months of the preceding fiscal year.

The counsel for the prosecution in the Whittaker Court Martial rested the case on Tuesday last, and the defense was opened with Cadet Whittaker on the stand. He again related the "story of his wrongs," and was sharply cross-examined by opposing counsel.

The historic eagle, "Old Abe," died last week in the Capitol at Madison, Wis. He followed the Eighth Volunteer Infantry of Wisconsin through 30 battles, being near its flag in every contest, yet he never received a wound, though often the mark for the enemy's riflemen. In 1579 he was exhibited in Boston for the benefit of the preservation fund of the Old South Church.

James Currie, the supposed murderer of Porter, the actor, was killed in Los Vegas, New Mexico, while on a drunken spree. He threatened to take the life of a bar-tender, who shot Currie in self-defense.

Wisconsin law-makers are on the right track, and we hope they will not re-*treat*. The Governor signed the "Anti-treating" bill, and now, if a company of young men in that State wish to drink together, each must pay for what he drinks, as is the custom in Germany, where treating is said to be almost unknown. Many think the law will be a dead letter, while others believe it will materially lessen drunkenness and crime.

Secretary Hunt will shortly issue a circular relative to the enlistment of boys in the navy. They must be between 14 and 18 years of age, able to read and write, robust and of good character. They will be enlisted as third class, at $9.50 per month, and one ration, with promotion for good conduct. The prime object is to place in the naval service, with the consent of parents, good, deserving boys, who will elevate its service.

The States of Michigan, New Hampshire, Rhode Island and Vermont pay their Governors $1,000 a year; New York and Pennsylvania, $10,000; California, Illinois and Nevada, $6,000; Indiana, Missouri, New Jersey, Virginia and Wisconsin, $5,000. Oregon pays $1500, and the others from $2,000 to $4,000 each.

Francis Murphy, the temperance lecturer, who has been resting at Cape May for a few days, after six weeks of revival work in Pittsburgh, is preparing to go to Europe for the purpose of starting temperance revivals in Scotland and England. He will sail about the last of July. Prior to that he will conduct a series of farewell meetings in Pennsylvania and Ohio.

[Elgin, (Ill.) Daily Leader.]

The subjoined opinion, we perceive, is by J. A Daniels, Esq., of Messrs. Stogdill & Daniels, Attorneys, La Crosse, Wis., and appears in the La Crosse Chronicle: Sometime since I was attacked with pain in and below one of my knee joints. A few applications of St Jacobs Oil quieted the pain and relieved the inflammation. I regard it as a valuable medicine.

FOREIGN NEWS.

IN view of the vast European complications that may arise from it, the attitude of Greece is at present a topic of high interest. As an inducement to remain at peace during the Turko-Russian war, the little kingdom was promised a slice of Turkey when the war should be over. On the conclusion of hostilities, the signers of the treaty of Berlin *advised* the Sultan to cede certain territory to Greece. The Porte agreed to make over a part of the territory mentioned, but absolutely refused to grant the whole of it. The matter has ever since been wrangled about, Greece sticking to her first demand, and Turkey yielding a little more under pressure, but finally making a resolute stand on some of the territory claimed by Greece. The latter has 80,000 men under arms and appears resolved on war. The Ottoman forces would make short work of the Grecian army, however, if the European Powers kept their hands off; but once the war is begun Austria, Italy and England will probably take a hand in it at an early day, and the other Powers may soon pitch in also. By this morning's cablegram it appears that Greece is in the attitude of a slim, little fellow trying to get at a much stouter and stronger man but held back by a circle of giants. The Great Powers are trying to restrain Greece from pitching into Turkey.

Another possible war cloud looms over Tunis in north Africa. France, having possession of Algiers, has long had a covetous eye on its neighbor Tunis, and making use of a late quarrel with the Bey, seems resolved to seize upon the country. When England occupied Cyprus at the close of the Turko-Russian war, it is said that Lord Beaconsfield's government promised that no objection would be made to the occupation of Tunis by France in reward for the latter's acquiescence in Great Britain's possesson of Cyprus. Italy, however, objects to the further aggrandisement of France on the Mediterranean, and if well backed up, may go to war to prevent it.

In England, it is now asserted that Parnell and his followers will support Mr. Gladstone's land bill for Ireland, and cease all opposition to the election of Liberal members of Parliament. This reconciliation of the "irreconcilable" Irish agitators goes to prove that this bill is of a rather radical nature. Its provisions are not yet positively known, but it has leaked out that it will secure stability of tenure; make landlords liable for damages for unjust evictions; establish right of free sale of leases; grant facilities for the purchase and ownership of land by farmers; make provision for the sale of large tracts of waste land in small holdings, and work a great revolution in the condition of the Irish farming classes by securing the just reward of honest labor. Under such a law it is expected the conflict between landlord and tenant will rapidly subside, and Ireland enter upon a new era of prosperity. To secure the passage of the bill against the bitter opposition of Irish and English landlords, the English tenant farmers and agricultural laborers are being organized, and great mass meetings being held.

That furred tongue, bad tasting mouth and miserable feeling, say you need Hop Bitters.

AGRICULTURAL NEWS.

According to Liverpool reports, from 53,000 to 56,000 barrels of American apples have been sold there weekly, mostly at 12s. to 14s. a barrel, though some of the choicest Newtown Pippins touched 30s., or $6.....Boston sent to Europe some 500,600 barrels of last year's crop of American apples.....The Northern Illinois Sheep Breeders' Association will hold its third annual sheep-shearing festival at the fair grounds in Woodstock April 21 and 22. The exhibition is open to all.....There are 306,096 acres of orchards in the State of Illinois, giving an average product of $26.70 per acre.....Despite the advice of the Land League to tenant farmers—not to leave the country—95,857 persons left "Old Ireland" last year, an increase of 48,493 over the previous year.....Com Le Duc says the seeds of "Hulless" Oats distributed for two or three years by the Department of Agriculture failed to obtain favorable reports from those who tried them.....The Grand Jury is busy investigating the Missouri land frauds, at St. Louis. Of course, a lot of Chicago rascals are implicated. ....An old Pennsylvania farmer says that those who left their corn standing in the fields will find it dangerous husking in the Spring, as the shocks will be full of snakes which have made their winter-quarters there.....A bill has passed both Houses of the Connecticut Legislature declaring cider an intoxicating beverage, to be subject to the same restrictions concerning its sale as apply to other liquors.....A hundred English skylarks are to be set at liberty in New Jersey to make the sky melodious.....The report on trichinæ, compiled by the late Passed Assistant Surgeon Glazier, of the Marine Hospital Service, is now passing through the press at the Government Printing Office, and will soon be ready for free distribution.....The rural newspapers of Canada complain of a general exodus of young men to the United States. Towns, in many cases, lose all their unmarried males, which make it bad for the marriageable females and for the future general prosperity of the community..... Canada settlers in New England are talking of returning to the Dominion tempted by the government's liberal offers of land and agricultural help in Manitoba.....A chestnut tree which was cut down the other day by John Budd of Sandburgh, Sullivan County, N. Y., made 1,800 marketable fence rails, besides much firewood. The tree contained 2,000 rings at the butt, which, it is claimed, indicated that it was 2,000 years old.

The Assembly of this State has passed that bill requiring boarding-house keepers, etc., who use oleomargarine, to display a placard in the dining-room announcing the fact.....The Cincinnati Price Current, published last Thursday its 32nd annual report of pork-packing in the West for the Winter ending March 1st, showing for the Winter a total of 6,916,456 hogs packed, being 30,995 less than for the preceding Winter. The total for the 12 months is 12,243,854, showing an increase of 1,241,655. The Winter's average is 207.71 pounds, against 212.94 pounds last year. The average yield per hog of lard is 35.65 pounds, against 36.62 last Winter. The reduction in the number and weight during the Winter is equivalent to 200,000 hogs of the average of a year ago. The amount of mess pork made during the Winter is 359,691 barrels—a reduction of 170,867 barrels. The reduction in the production of lard is 5,762,043 pounds. The prospect for supplies of hogs for the Summer season is regarded as much below last year up to June, but beyond that time as not varying much from last year.....It is now estimated that 22,000 of the 850,000 cattle in Colorado have died during the past Winter, a larger mortality than has been ever before known. A large share of them were driven into Texas when Winter came, but those left behind suffered severely, 1,100 dead carcasses being counted in 22 miles along both sides of the Platte River near Julesburg.

Of grain bags 41,614,000 were sold last year to California farmers.....Last year Portugal bought nearly as much of our wheat as Germany..... Massachusetts farmers seem "bound" to have an experiment station.....The New England Milk Producers' Association recommend the formation of a company with $200,000 capital, to supply Boston with pure milk.

There is great excitement in Belmont County, Ohio, over a horse epidemic raging there. The disease resembles glanders, and is pronounced by veterinary surgeons incurable and contagious. A number of horses have died, and many others are sick. Horse owners say there is great danger from a spread of the disease.....In France frequent storms have impeded the sowing of Spring grain; but so far fall-sown grain has not been injured. Field work is about two weeks behind hand.

Relief from Neuralgia.

A gentleman who had suffered from a severe attack of Neuralgia, writes: If I had not had Compound Oxygen to resort to the last six days, don't know how I would have gotten through. Had Neuralgia one day in face and head, but found, by increasing times of inhalation, a prompt remedy." Treatise on "Compound Oxygen" sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

Facts.

Ponder on these facts—you cannot be well or get well if your bowels and kidneys refuse to act properly. Kidney-Wort will restore their healthful action. Buy it in either the dry or liquid forms and give it a faithful trial. Druggists sell it.

Women that have been pronounced incurable by the best physicians in the country, have been completely cured by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, billousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Oh, why will you let that invalid friend suffer that Hop Bitters will so easily cure.

BURNETT'S COCOAINE

Will Save the Hair.

And keep it in a strong and healthy condition, because it will stimulate the roots of the hair, and restore the natural action upon which its growth depends.

Burnett's Flavoring Extracts are absolutely pure.

The Markets.

Hogs quiet; common, $4 25@5 25; light, $4 45@5 85; packing, $5 35@5 80; butchers', $5 90@6 30.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 2, 1881.

BEANS AND PEAS.—Supplies of beans continue moderate and mediums are the specially firm item of the list. Exportation is moderate but the home trade is large enough to toughen prices. The long Winter had added greatly to consumption especially as best potatoes have ruled high and were immovable a good deal of the time owing to the danger of freezing. Pea and white kidney beans are firm in sympathy with other white. Red kidney remain almost a drug; a wholesale buyer would obtain considerable concession from the nominal quotations. It really looks as if nothing would give them a trade place outside of a home demand. Such mills have always been light as only a small portion of foreigners have used them. Black beans are quiet; we learn that much of their former Southern want has been latterly filled by a home crop of a variety of beans that has become popular. Lima beans scarce; Western green peas are quiet; a few car loads per week more than stocks the easier market, Southern B. E. peas steady.

Marrow beans prime $2.10 other $2@2.05; medium, prime $2.12½; other $2@2.07; pea and white kidney $1.95@2.10 red kidney, choice, $1.55@1.60, other, $1.40@1.50; lima $4.50@5 Green peas Wis. in bbls. $1.60@1.65; Southern B. E. peas $2.50 per 2 bu bag.

BEESWAX.—A light trade in progress and steady prices; quoted at 21½@25c.

BROOM CORN.—There has been very little New York trading in this item for many months. Philadelphia now rules most sales of this section of the country. Choice in a small way has made 7½c. here

BUTTER.—New butter holds well to the opening prices when fine. The general average of quality is not fine, the most marked difference being in Western goods. Old butter is pressed for sale at lower figures. Its outlet is very narrow this Spring. Advices from abroad at present will deter exporters from using it at any price. Oleomargarine is again in strong debate, and various suggestions are made with a view of keeping it apart from pure butter in the trade. The line of discrimination is, however, a wide one, and while so many consumers are unable to detect the fraud, and a large class of retailers are willing to dispense it with enlarged profit, it will be difficult to adopt a lasting remedy in the interest of farmers.

New Butter.—Creamery, choice Western, 34@35c.; State and Penn., 30@33c.; fair to prime, 27@30c.; dairy tubs, choice, 27@28c.; other, 20@25c.; Welsh tubs, choice, 26@27c.; fair to prime, 23@25c.; poor, 15@18c. Old Butter.—Creamery, 15@23c.; dairies, entire, 17@20c.; firkins, 13@20c.; pails and half tubs, 13@25c.; Welsh, 13@18c.; Western imitation creamery, 20@23c.; fresh dairy, 13@15c; other, 12@21c., factory, fine, 18@19c.; other, 11@17c.; very poor, 8½@10c.; grease, 7@8c.

Exports for week, flour, bbls. 110,490; corn meal, do. 8,700; wheat, bush 738,830; corn, do. 678,190; oats, do. 6,321; peas, do. 1,775; beans, pkgs. 620, rice do. 1,240.

FRESH FRUITS.—Exports of apples for week, 16,908 bbls. The market is irregular, the bulk of stock offered at low prices. Fancy guaranteed lots of red will command 25@37c. per bbl. more than the general list, mixed lots at station $1@1.25.

Baldwins and russets $1@1.62, greenings $1@1.37; Spitzenbergs $1.25@2; rejections 50@75c; cranberries are pedding out at $1@1.75 for N. J crates. Fla. oranges dull with the last end of the season here; range for h'f barrel cases $1.50@3; Fla. strawberries good to prime 75c@$1; other 20@50c. per qt. Hothouse strawberries $1.50@2 per quart. Black Hamburg grapes per lb. $4@5. Peanuts dull with a large supply. Va. hand-picked 4¾@4¾c; extra prime 3½@3¾c; good to prime 3@3¼c; shelled 2½@3¼c; pecans 7@8c.

GRAIN.—Wheat has been active and closed higher partly on account of the unfavorable crop reports; latest prices are for

No. 1 white at $1.21¼@1.22¼, do. April at $1.20⅞ 1.20⅝c. do. May at $1.19@1.19¼ No 2 white at $1.20@$1.21; ungraded white at $1.18¾@1.21; mixed Winter at $1.21 No. 1 red at $1.30. No. 2 red at $1.24¾@1.25 for railroad, and canal at $1.22¾@1.23½; do. April at $1.23⅛; do. May at $1.22⅜; do. June at $1.21⅝@1.21¾; do, steamer grade at $1.20¾@1.21; No. 3 red at $1.20¾@1.21; ungraded red at $1.15@$1.20; rejected Spring at 98¼@99c.; ungraded Spring at $1.1t.

Rye is firm with full lots quoted at $1.06@1.07. Corn has been active and higher; exports for the week 84,000 bush; latest prices are for

New York No. 2 at 58¾@59¼c do. April at 57¾@57¾c., do May at 54¾@54¾c do. June at 54¾@54¾c No. 3 at 54¾@55¾c.; ungraded mixed Western at 57@59c; New York steamer mixed at 57½@59c, No. 2 white at 59¼@60c.; white Southern at 60c.; steamer yellow at 56¼c.; yellow Southern at 56@56½c

Oats are active and favor holders; latest prices are for

New York No. 2 white at 46; No. 3 white at 44¾@44¾; New York No. 1 at 45½; New York No. 2 at 44¾@46, do. April at 44¾@45, do. May at 43¾@43¾; do. June at 43¾@44. No. 3 at 44¾@45, ungraded white Western at 43@48¾; ungraded mixed Western at 44@46¾; white State at 50, No. 2 Chicago quoted at 46c.

HAY AND STRAW.—Prime hay is in demand and well sustained in price; low grades of hay are abundant and favor buyers. Latest prices are for

Hay, prime timothy at $1.10@1.15 ℔ 100 lbs.; medium timothy at $1,00@1.05 do., shipping grades at 90@95c. do.; clover mixed at 85c.@$1.00, clover at 85c@90. do. Straw—No. 1 rye at $1.15@1.20 ℔ 100 lbs.; No. 2 rye at 75@80c. do.; oat and wheat at 60@70c. do.

HOPS.—Exports for the week, 403 bales; the demand from shippers is without improvement and brewers buy moderately, with prices unchanged. Quotations are for

	Cents per ℔

Olds, all growths	4 @10
Pacific coast, new	19 @23
Bavarians	30 @35

Receipts for week, 1,025 bales.

Exports do., 374 do.

MAPLE SUGAR.—The demand is fair for both sugar and sirup. Prices have declined with free arrivals. Fancy refined Vermont sugar exceeds quotations Good light State and Western, 8@9¾c, poorer lots, 7@7½c. Sirup, 10@11 ℔. tin cans, 75c@$1 with can.

OIL-CAKE.—Western is quoted at $29.50@30 per ton

POULTRY AND GAME.—The arrivals of dressed poultry have continued light, and after the long Winter just passed there is not much left to be packed. Sellers are asking stiff prices and have no supplies, even though Lent is yet here. Case frozen poultry is likely to have a good place for all desirable parcels to come.

Turkeys, fresh and frozen, choice, 17@18c.; other, 15@16c.; Phila. chickens, broilers, 25@33c.; do. large, 19@21c; N. J. chickens, 16@20c; State and Western fowls and chickens, 13@16c; Phila. fowls, 15@16c.; other, 13@14c.; State and Western fowls, 14@15c. Capons, large, 25@26c.; small and slips, 21@23c. Ducks, choice, 20c.; other, 15@18c. Geese, 8@10c.; Squabs, white, $4 ℔ doz.; do. dark, $3.25

Live poultry has a steady sale at good prices. City killers now use up all coops of fowls and turkeys close—a very early beginning for that branch of the trade.

Fowls, 15@16c.; roosters, 8@10c.; turkeys, 15@16c.; ducks, choice, $1.25; other, 75c@1; geese, choice, $2.25; other, $1.25@1.75; pigeons, 35@45c. Of the latter only strongly developed birds are wanted, mainly for pigeon matches.

The market is firm for good birds. English snipe and wild pigeons quoted $2.50 ℔ doz. Southern Canvas-back wild ducks, $1.75; red-heads, 75c; mallard and black, 30@40c; Western mallard and red-heads, 40@50c.; common ducks range 15@25c.

PROVISIONS.—Hog products have a more active demand and prices stronger.

Mess pork quoted at $12@15¾ for old and $16@16.25 for new, $16.20@16.30 for April; $16.25@16.35 for May and $16.30@16.35 for June. Bacon at 8@10 for long clear and 8.90 for short clear. Beef hams at $21@23. Beef at $21@23 for extra India mess. Western steam lard at 11.05@11.07½ for April, 11.07½ for May, 11.10 for June, and 11.12½ for July. Stearine at 11¾@11¾.

Receipts for week, beef, bbls and tcs. 710 pork, 3,600 bbls.; cut-meats, 18,950 pkgs; lard: 7,700 pkgs.

Exports for week, beef, bbls. and tcs., 2,575; pork, 3,050 bbls.; cut-meats, 10,781,304 lbs.; lard, 5,738,550 do.

SEED.—Clover is in light demand: quoted 8¼@9. Timothy is quiet at $2.80@2.90

VEGETABLES.—Exports of potatoes for week 640 bbls. Fine sorts of potatoes begin to show more strength now that buyers perceive that the late additions to supplies are not desirable. Some State stock is going direct to the West.

Bermuda potatoes $6@7 ℔ bbl.; Early Rose, Nova Scotia d.h. $2.50@2.62. Maine $2.37@2.50, State, $2@2.25; do. bulk $2@2.12, Prolific, $2; Mercer, 1.75@1.87; Jackson White, $1.75; Burbank, $2.00@2.25; do. h. h. $2.12@2.37, Snowflake, $1.75@2, do. bulk $2@2.37, peachblow d.h. $2.25, Peerless, $1.62@1.75; do. bulk $1.50@1.62, sweet Del. $2.25@2.75.

Southern green stuff has been delayed and has frequently turned out badly; prices have a wide range for perishable stuff. Some good remnants of old garden truck remain notwithstanding the long past Winter.

Fla. green peas per crate $1@4; do. tomatoes, $2.50@3 ℔ half bush box; Bermuda tomatoes, 90c.@$1 ℔ 6-quart box; do beets $2@2.50 ℔ crate; do. onions, $5; Norfolk Spinach, $2.50@3 ℔ bbl.; do. kale, $1.75@2; do. radishes, $3@4 ℔ 100 bunches; Chas. asparagus $7 ℔ doz.; do. lettuce $3@6. per bbl.; W. and Russian 50@75c do beets, 75c@$1 ℔ bbl.; cabbages, $4@6 ℔ 100. Hubbard squash, $1 ℔ bbl.; marrow do. 50@75c.; onions, white, $4@4.50 ℔ bbl.; yellow $2.50@3; other, $2.25@2.50; carrots, $1@1.25; celery 50c@$1.

TOBACCO—Has been moderately active and prices steady.

LIVE STOCK MARKETS.

NEW YORK, Saturday, April 2, 1881.

BEEVES.—Receipts for the week 12,339 head; do. last week 8,365 do. The market has worked splendidly for sellers, Wednesday's prices were good but the close shows an advance of ½c. over them, and a bright prospect is possible for next week. The transactions were chiefly at 9¾@10¼c. for only common to fair steers to dress 56 lbs., and 11@11¾c for good to prime, dress 56@57 lbs. This week's prices are rather severe upon tender butchers and sellers make cautious moveme ts.

COWS AND CALVES.—Good cows will soon be profitable at home and recent receipts are not of a high average quality as prices will indicate. Common to good $25@55, a few extras at 160.

SWINE.—Receipts for the week, 21,935 head; do. last week, 19,764 do.; market quoted steady for livest 5¾@6¾c.

Country pork, light, 8¾@8¾c.; medium, 8@8¼c.; heavy, 7¾@7¾c. city dressed Western, 7¾@7¾c. Prolonged cold weather and light supplies of dressed keeps the market firm. Pork tenderoins, 11½c.

SHEEP AND LAMBS.—Receipts for week, 21,933 head; do. last week, 21,060 do. Sheep have had a good stiff market and prices close firm. A car load of fine Ohio brought 7c. other sales 5¾@6¾c.; yearling lambs 5¾@7¾c.; Spring lambs per head $3@7.

VEAL CALVES.—Low quality live and dressed abundant, prices weak for any grade but choice.

New Jersey live fed choice 8c; good to prime, 6@7½c.; common 5@5½c.; grassers, 4@5c. buttermilk, 2½@2½c.; Mt. Holly, calves, range 4@8½c.; dressed choice 10c.; good to prime 8½@9½c.; poor to fair 6@7c.; very common 4@5c. "Bobs" continue to arrive and are promptly seized by the Health Board.

For close confinement, want of air, sedentary habits and brain and nerve-tire, trust in Hop Bitters.

FARMING FOR BOYS AND GIRLS—NO. 17.

HENRY STEWART.

The Use of Artificial Fertilizers.

MANURES and fertilizers are food. They supply plants with nourishment. But this food must be given in a rational manner or it may do harm. An animal may be injured by improper feeding, and so may a plant. It is necessary then that we should use caution in the use of manures, and more especially in the application of the common artificial fertilizers, because these are too strong to come into close contact with the tender root fibers.

Common yard manure even may be used so as to injure plants. For instance, in the attempt to make a plant grow very quickly, one may put a quantity of fresh manure in a hill and plant some seeds, such as beans, cucumbers or melons, directly upon the manure. This soon heats and forces the seeds to sprout; but the young sprout is immediately killed by the excess of heat and if the hill be examined the seeds will be found dead and rotten. A similar mistake is often made in the attempt to make a hot bed of fresh manure and sowing the seeds too soon. The bed heats too much for the seeds and the young plants are destroyed. This mistake is often made by old gardeners and farmers; and sometimes experienced persons have overlooked this danger, and have had all their labor lost in this way. This, however, can scarcely happen in field work, because manure is used there only in small quantities and is soon mixed with the soil. But when using the stronger artificial manures it is often the case that a handful of it is dropped in a hill and the seed, either corn, beans, melons, or even young cabbage plants, are placed in contact with the fertilizer and so destroyed. So that it is necessary to be very cautious in this respect and take care to mix the fertilizer with the soil for some distance from the seed or the young plant. There is then no danger, for the moisture in the soil soon dissolves the fertilizer and holds it in solution and spreads it through the soil where the roots reach it and are able to dispose of it with advantage.

Many farmers are in the habit of drilling fertilizers with wheat or rye, and no doubt there are cases in which some of the seed is injured, more especially in a dry season. This danger would be avoided if the fertilizers were mixed with earth so that it could be sown by the drill with the same ease as if unmixed; but the safest way is to scatter the fertilizer broadcast over the soil and harrow it in at least a day or two before the seed is sown. Some fertilizers are strong poisons and contain the most corrosive acids, and it has sometimes occurred that animals have been poisoned by merely licking the empty bags or by drinking the water of brooks or ponds, in which the bags have been placed to soak or be washed. This is another way in which caution should be observed in regard to these fertilizers.

On account of this peculiar character of these useful substances, it is advisable to apply them either when rain is expected or after it has fallen. This is necessary when they are used for growing crops, as a top-dressing for grass or young grain in the Spring. The falling rain or a heavy dew even will dissolve them and dilute or weaken them, so that when carried into the soil they will be rendered harmless.

Those young persons who like to work in the garden, among vegetables and flowers, will find these fertilizers, more especially guano, to be of great value in forcing a strong and rapid growth. But they must remember how highly concentrated a food for their plants they are using and that a very small quantity—a teaspoonful even—will usually contain in that small space as much of the fertilizing elements as a large forkful of the best manure. They will then feed their plants very sparingly, because too much may easily be worse than too little and if it does not kill the plants outright it may stunt and retard the growth instead of encouraging and hastening it. A safe mode of applying any artificial fertilizer in the garden is by dissolving it in water and watering the earth—not the plant—with the solution. Another method equally safe, and easier, is to scatter a small quantity, as a teaspoonful, around the plant for a distance of at least six inches in every direction and then hoe it into the loose soil. The first shower will dissolve it and carry it into the soil and the plant will soon show by its deep green color and its freshened vigor how grateful it is for the needed food. Such an application may be repeated two or three times during the season and when plants are grown for exhibition, and large and fine specimens are desired, it may be repeated weekly, but copious watering will then be needed, or the plant will not be able to make use of the food supplied to it.

These directions should serve as a general rule for application in all cases. It is necessary for every farmer and indeed every other person to think and to act reasonably. Then knowing the nature of those things we are using for our purposes, and what dangers are to be avoided in their uses, we can apply them with safety and benefit.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—My father is a subscriber to your paper, so I thought I would write and ask you to enroll my name on your list of RURAL Cousins. I am very much interested in the cousins' letters, and have often thought about writing to you. We live on a pleasant farm about four miles west of Springfield. My father owns three limekilns and a stone-quarry. He burns lime part of the time and carries on farming to a certain extent. I had a garden last year and I intend to have one next Summer. I have a brother thirteen years old and two little sisters, one aged seven years and the other three. I am ten years old myself. I wish more of the cousins would write. I would like to hear from them very much.

Your niece, EDITH HOLCOMB.

Springfield, Ohio.

DEAR UNCLE MARK:—I am a girl fourteen years of age. Last year I had a garden of my own and had quite a variety of vegetables and flowers. I often thought I would write to tell you about it but I failed to do so. In my garden I had roses, verbenas, asters, phlox, snapdragons, tomatoes, watermelons, musk-melons, cabbage, cucumbers, peas, beans and beautiful gladioli. I did not give them as much care as was necessary, but they did very well. Mother has a great many flowers in the house this Winter, and has quite a number in blossom. I always wanted to join the Horticultural Club and now with your leave I will ask admission. We have a great variety of shrubbery and small fruit, therefore your special notice of them is very satisfactory to us.

Racine, Wis. MARIA V. SHELDON.

UNCLE MARK:—I am a little girl ten years old, and would like to join your club. I have three brothers and one sister. My papa takes the RURAL and I like to read the cousins' letters. My mamma has a good many house plants, among them is a large calla lilly, a heliotrope, a large fuchsia, two large pinks, a great many geraniums and many other plants. I have a little toad cactus, which has long, round leaves covered with prickers. My papa has a great many strawberries and several kinds of grapes. I had a little flower garden last Summer and I mean to have one again this Summer, so when you send seeds again please remember me. Your niece,

Hartford, Conn. BERTHA S. GIDDINGS.

DEAR UNCLE MARK:—I call you so because I am anxious to be adopted into your family and become one of the RURAL cousins. My sister and I like the letters published from the cousins ever so much. My father takes six weekly papers but we like the RURAL best of all. I am 10 years old and my sister is 12. We live on a fruit farm and I intend to be a fruit grower when I am a man. Father gave me two rows of grape vines in one of his vineyards last year, which I attend to, myself, and when the fruit was marketed I received $21. for it, with which I intend to buy a new variety of grape roots and set out on land my father has given me. I have a colt, a calf, a dog, four cats and two canary birds. Your nephew, MAX FAY.

Portland, N. Y.

DEAR UNCLE MARK:—I would like to join your Club, if you will take a little Rocky Mountain girl for one of your nieces. My pa takes the RURAL and thinks he could not do without it. The mangel seed we got from the RURAL last Spring we planted, and when pa pulled the mangels he thought there was a wagon load of them. Our Cow-peas did not amount to anything. I must tell you what we have growing in our lot. Three apple trees, three crabs, two plums, two cherries, and, on the north side, three or four dozen gooseberries and currant bushes, and, last but not least, a nice bed of strawberries. I love a nice garden and plenty of flowers.

Boulder, Col. IDA M. DAVIDSON.

DEAR UNCLE MARK:—We have taken the RURAL for so many years that it seems indispensable to the family. I am very fond of flowers and would like to become a member of the Horticultural Club. We have a hydrangea 16 years old. It has every year over a hundred blossoms of a beautiful pink color. I have a canary and two tame fishes. One is a chub and the other a sunfish. I have them out of doors in Summer and in the house in Winter. I have two tame chickens; the hen I call Biddy, the rooster I call Dick. I have read with a great deal of interest the letters from the cousins.

Valatie, Columbia Co., N. Y. RURAL GIRL.

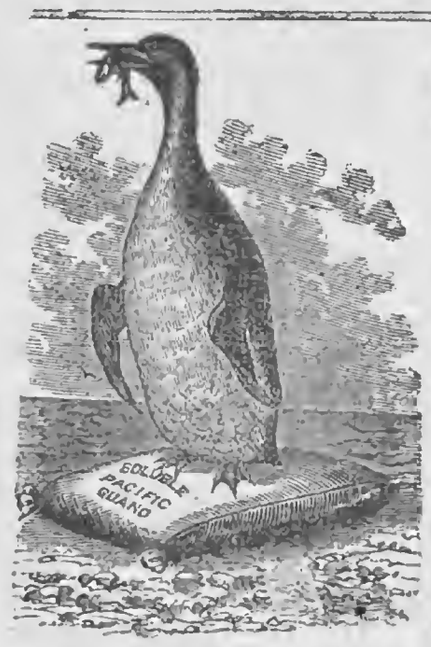
Fertilizers.



SECOND TO NONE.

Soluble Pacific Guano.

Sale in 1865 - - - - - 754 Tons.
" 1880 - - - 44,700 "

This Fertilizer, which was at first sold almost entirely in the Southern States, has of late years become so deservedly popular in the North, for the cultivation of all Farm Crops, that the Company have enlarged their works especially to supply the Nothern demand, and we are now in a position to fill orders promptly. Pamphlets containing testimonials and other information furnished by our local agents, or on application to

GLIDDEN & CURTIS,

GENERAL SELLING AGENTS OF PACIFIC GUANO COMPANY
Boston, Mass.

BOWKER'S
HILL AND DRILL
PHOSPHATE
SEND FOR PAMPHLET.

This is a true bone superphosphate, and may be used *on any crop*, in the hill or drill or broadcast, either *with* or *without* manure, and will produce a much earlier and larger crop. In the Report of the Mass. Inspector of Fertilizers, its valuation is from $3 to $10 per ton higher than other Phosphates which sell at the same price. The past year over 3000 tons were sold against 100 tons three years ago, showing that it is liked by the farmers. If there is no local agent near you, send to us.

Also for sale OCKBRIDGE MANURES.

BOWKER FERTILIZER CO.
BOSTON & NEW YORK

STOCKBRIDGE
MANURES
SEND FOR PAMPHLET.

These manures are the richest fertilizers now manufactured, and the best substitute for, and costing *much less* than guano, which is now practically out of the market. Unlike guano, they *are not stimulants* and *exhaustive*, but *permanent* and *lasting*, being composed of bone, potash, etc. You can draw at one load enough for 3 to 5 acres, or as much plant-food as is contained in 20 loads of ordinary straw manure. Corn, potatoes, hay, etc., are bringing such good prices that it will pay to use the Stockbridge extensively. If there is no local agent near you, send to us.

BOWKER FERTILIZER CO.
BOSTON & NEW YORK.

Carpetings.

CARPETS.

We have now open for inspection and for sale a line of the choicest CARPETS ever offered in New York, of the latest and most desirable colorings and patterns.

WILTON CARPETS at $2.25, full five-frame, and equal in quality to anything offered in this market at $2.75 or $3 per yard.

AXMINSTER and MOQUETTE Carpets from $1.50 to $2.50.

Best BODY BRUSSELS Carpets, $1.25, $1.40, $1.50 and $1.60—the latter for the choicest patterns.

TAPESTRY CARPETS—We have opened a full line of 300 pieces at 75 cts. per yard. They cannot be had elsewhere in this city. We have other grades at 85 cts. and $1 per yard:

We have also on exhibition a superior TAPESTRY CARPET, equal in Texture and Quality to anything made either here or in Europe.

INGRAINS—We have of the best Extra Superior Grade a very full line from 75 cts. to 90 cts. per yard. Also, a line a grade lower at 65 cts. to 75 cts. —all wool.

If you want Carpets call and see what we have. You will get Reliable Goods and save money by purchasing from us.

PERSONAL ITEMS.

Judge McDill, the new Senator from Iowa, is a granger-looking man, with the plain, simple, hearty habits of a Western farmer. But he is by no means inexperienced.

Here is a severe prayer test. Mr. Miller, the new Senator from California, rose in one of the Moody meetings in San Francisco and asked prayers for himself in his endeavor to lead a Christian life in Washington.

Garfield rises at seven and breakfasts at eight. He spends an hour in dictating personal letters. He lunches at half-past two. Between three and four he reads the New York dailies, then receives members of the Cabinet, and dines at six. He spends the evening with his family and a few personal friends.

Mr. A. Keene Richards, who died in Kentucky on Saturday week, expended more than a million dollars in efforts to improve the breed of racehorses in America. He made two long journeys in the deserts of Arabia for the purpose of obtaining the pure Bedouin horse. He succeeded in getting a few of the best blood at fabulous prices, which he mixed with the most fashionable English and American racers. The result, however, up to the time of his death, failed to meet his anticipations, although many winners were sent from his beautiful Blue Grass Park, near Georgetown.

[New Albany Ledger-Standard.]

Speaking of Governors suggests the mention of an item we received from Mr. Henry A. Knight, Foreman at Chas. Waters & Co.'s Governor and Valve Works, Boston, Mass.: I have used St. Jacobs Oil among our employees and find that it never fails to cure. The men are delighted with the wonderful effects of the Oil, as it has cured them of bruises, burns, etc.

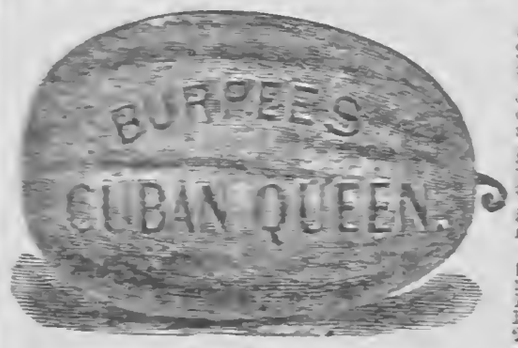
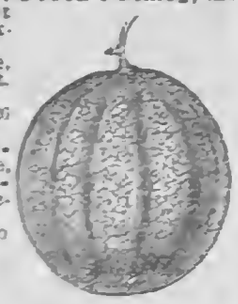
C. GILBERT'S STARCHES
ARE ABSOLUTELY PURE.

82-POUND CUBAN QUEEN WATER-MELON.



This new Melon from the West Indies is certainly the **Largest and Finest Variety** in the world. All who saw our crop the past season remarked they never before saw such a large, fine Melon, nor any so **wonderfully productive.** Their flesh is bright red, remarkably *Solid, Peculiarly Luscious, Crisp, and Sugary*—surpassing all others. On a Melon of enormous size there is barely half an inch of rind! They are very hardy, strong and vigorous in growth. *Price 25 Cts. per Packet or 15 seeds;* 5 Packets for $1.00, post-paid. We offer **$50.00 IN CASH PRIZES,** to be awarded as follows:—$25.00 to the grower of the Largest Cuban Queen Water-Melon; $15.00 to the grower of the second largest, and $10.00 to the grower of the third largest. Do not fail to try and see how large the **Cuban Queen** can be grown.

OTHER SPECIALTIES FOR 1881.—**Burpee's Netted Gem Musk-Melon** (see Illustration), the most productive and most delicious small Early Citron. Price, 25 Cts. per packet. **Montreal Green Nutmeg,** the largest Musk-Melon known, weight 22 lbs., and of superb flavor. Packet, 25 Cts.



Burpee's Climax Tomato, far ahead of Acme, and the best of all tomatoes. Price, 25 Cts. per packet. **Burpee's Surehead Cabbage,** always heads. 15 Cts. per packet. **American Wonder Peas,** genuine. 15 Cts. per packet; 60 Cts. per pint, post-paid.

A New Morning-Glory—The Eclipse, from Brazil, surpassingly beautiful. 25 Cts. per packet.

A Liberal Offer only to those who order from this advertisement. **For One Dollar** we will send by mail, post-paid, to any address, one packet of each of the above, amounting in value to $1.50, and will also give two trial packets of **New Early Cabbages** and a sample of the **New Golden Grains Wheat. Order now!** *Postage-stamps accepted at cost.*

Burpee's Farm Annual for 1881, beautifully illustrated, mailed free to all who write for it.

Address W. ATLEE BURPEE & CO., Seed Warehouse,
Nos. 219 and 221 Church Street, Philadelphia, Pa.

MAYNARD'S RIFLES AND SHOT-GUNS.

PRICES REDUCED.

For **Hunting and Target Practice, at all ranges,** the "MAYNARD" **more completely supplies the wants of Hunters and Sportsmen generally, than any other Rifle in the world,** as many barrels can be used on one stock; and for **accuracy, convenience, durability and safety,** is not excelled. Send for Illustrated Catalogue describing the **new attachment** for using rim and centre-fire ammunition.

MASS. ARMS COMPANY, Chicopee Falls, Mass.

IS AN OLD FASHIONED HAND FORGED RAZOR STEEL KNIFE.

MAHER & GROSH 30 Monroe St., Toledo, Ohio, to introduce their brand of cutlery (every blade warranted and replaced Free if soft or flawy), will send postpaid, knife like cut, strong blades and ebony handle for 75c.; or with 3 blades, $1. We have 1 blade knife, 35c.; extra heavy 1 blade, 50c.; medium 2 blade, 50c.; extra heavy 2 blade made for hard usage, 75 cts.; **Our Best** 2 blade, every blade tested, $1. Boy's 2 blade, 25c. Ladies' 1 blade, 25c.; 2 blade, 50c.; Gents fine 3 blade $1. **Pruners,** oil temper and tested, $1. Budding knife, 65c.; Hunting knife, $1. Cattle knife, $1.; Sample 6-inch. hand forged, Butcher knife, postpaid, 50c Illustrated list free. Liberal discount to dealers. Ask our Postmaster about us.

H. W. MARSELLUS,

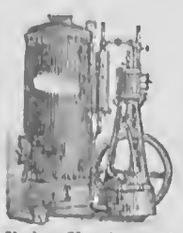
CIDER PRESSES AND GRATERS.
BOOMER & BOSCHERT PRESS CO., Syracuse, N. Y

SALT FOR LAND, FRUIT TREES, etc. FERRIS' LAND INVIGORATOR and CROP PROTECTOR, has in it all the Salt land requires besides other ingredients that make it very valuable. Death to Hessian Fly and other pests. Use it and reap a golden harvest. Large quantity of Agricultural Salt on hand.
EDWIN FERRIS & CO.,
Wholesale Salt and Fish Dealers, 123 and 145 Washington St., New York.

TROPIC FRUIT LAXATIVE
Prepared from tropical fruits and plants.
Try it once, and you will esteem it highly as a mild and effective remedy.
Is the Best and Most Agreeable Preparation in the World
For Constipation, Biliousness, Headache, Torpid Liver, Hemorrhoids, Indisposition, and all Disorders arising from an obstructed state of the system.
Ladies and children, and those who dislike taking pills and nauseous medicines to secure cathartic action, are especially pleased with its agreeable qualities.
Packed in Bronzed Tin Boxes only.
Price 25 Cents. Large Boxes, 50 cents.
SOLD BY ALL DRUGGISTS.

PAYNE'S FARM ENGINES

Established 1840.



Patent spark-arresting Farm and Dairy Engines of all sizes, from 2 to 12 horse-power, mounted or unmounted. Warranted to be the Best and Cheapest engines made. Prices from $150 upwards. Send for Illustrated Catalogue "A" which will give you full information and prices to
R. W. PAYNE & SONS,
Box 841, Corning, N. Y.

GREGORY'S SEED CATALOGUE

My Annual Catalogue of Vegetable and Flower Seed for 1881, rich in engravings from photographs of the originals, will be sent FREE to all who apply. My old customers need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed House in America, a large portion of which were grown on my five seed farms. *Full directions for cultivation on each package.* All seed *warranted to be both fresh and true to name;* so far that should it prove otherwise, *I will refill the order gratis.* The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables. I invite the patronage of *all who are anxious to have their seed directly from the grower, fresh, true, and of the very best strain.*
NEW VEGETABLES A SPECIALTY.

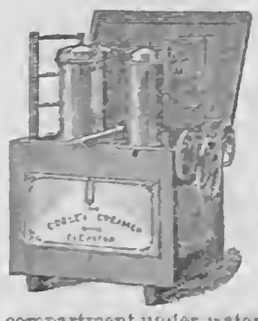
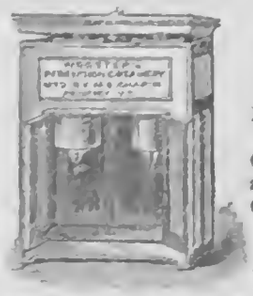
COOLEY CREAMER.
GOLD MEDAL, PARIS, 1879.



Butter made by this Process was awarded **Sweepstakes** at International DAIRY FAIR, 1878, and **Gold Medal** at same Fair, 1879.
Gold Medal at Royal Agricultural Exhibition, London, 1879.
MANUFACTURED IN FOUR STYLES AND TEN SIZES.
THE REGULAR.—The cans in this, removed to bench for skimming automatically
THE JUNIOR.—Skimming done automatically without removing cans. THE UPRIGHT OR CABINET.—Has a compartment under water tank, the illuminated conical point of cans projecting into this compartment, skims without removing cans.
THE ELEVATOR.—Has a hoisting arrangement for raising cans out of tank. Milk drawn off automatically before removing cans forms platform of elevator.
They require no milk-room. They raise all of cream between milkings. Impure air, dust or flies cannot reach milk set in them. The cans are submerged and water sealed in each style.
Each style has transparent panes for the purpose of determining when the milk is out, and cream about to flow. Our patents cover these processes.
No others have a right to use them.
Send for "DAIRYMAN" giving particulars.
VERMONT FARM MACHINE CO.,
Bellows Falls, Vt.



THE WOOSTER CREAMERY
Perfect in Principle and in Operation.
Can be used with LESS ICE and LABOR than any other Creamery now in the market
For Circulars address
M. D. CHAPIN,
Poultney, Vt., U. S. A

Rectangular & Square BOX CHURNS
Cheapest and Best.—No inside fixtures, and *always reliable.* Six sizes of each kind made. Three sizes of the Lever Butter Worker made. Best material used, and every Churn and Butter Worker warranted exactly as represented. One Churn at wholesale where we have no agent. Send postal for Circulars.
CORNISH & CURTIS, Fort Atkinson, Wis.

102 YOUR NAME In New Type on 102 Chromos, 13c. All new styles, designed by best artists. *Bouquets, Gold Chromo, Birds, Landscapes, Panels, Water Scenes, etc.* Best collection of Cards ever sold for 10c. Sample book containing samples of all our Cards, 25c. Largest Card House in America. Dealers supplied with Blank Cards. AMERICAN CARD CO., Northford, Ct.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XL. No. 16. WHOLE No. 1629. | NEW YORK, APRIL 16, 1881. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

The Herdsman.

ANIMAL PHOTOGRAPHY.

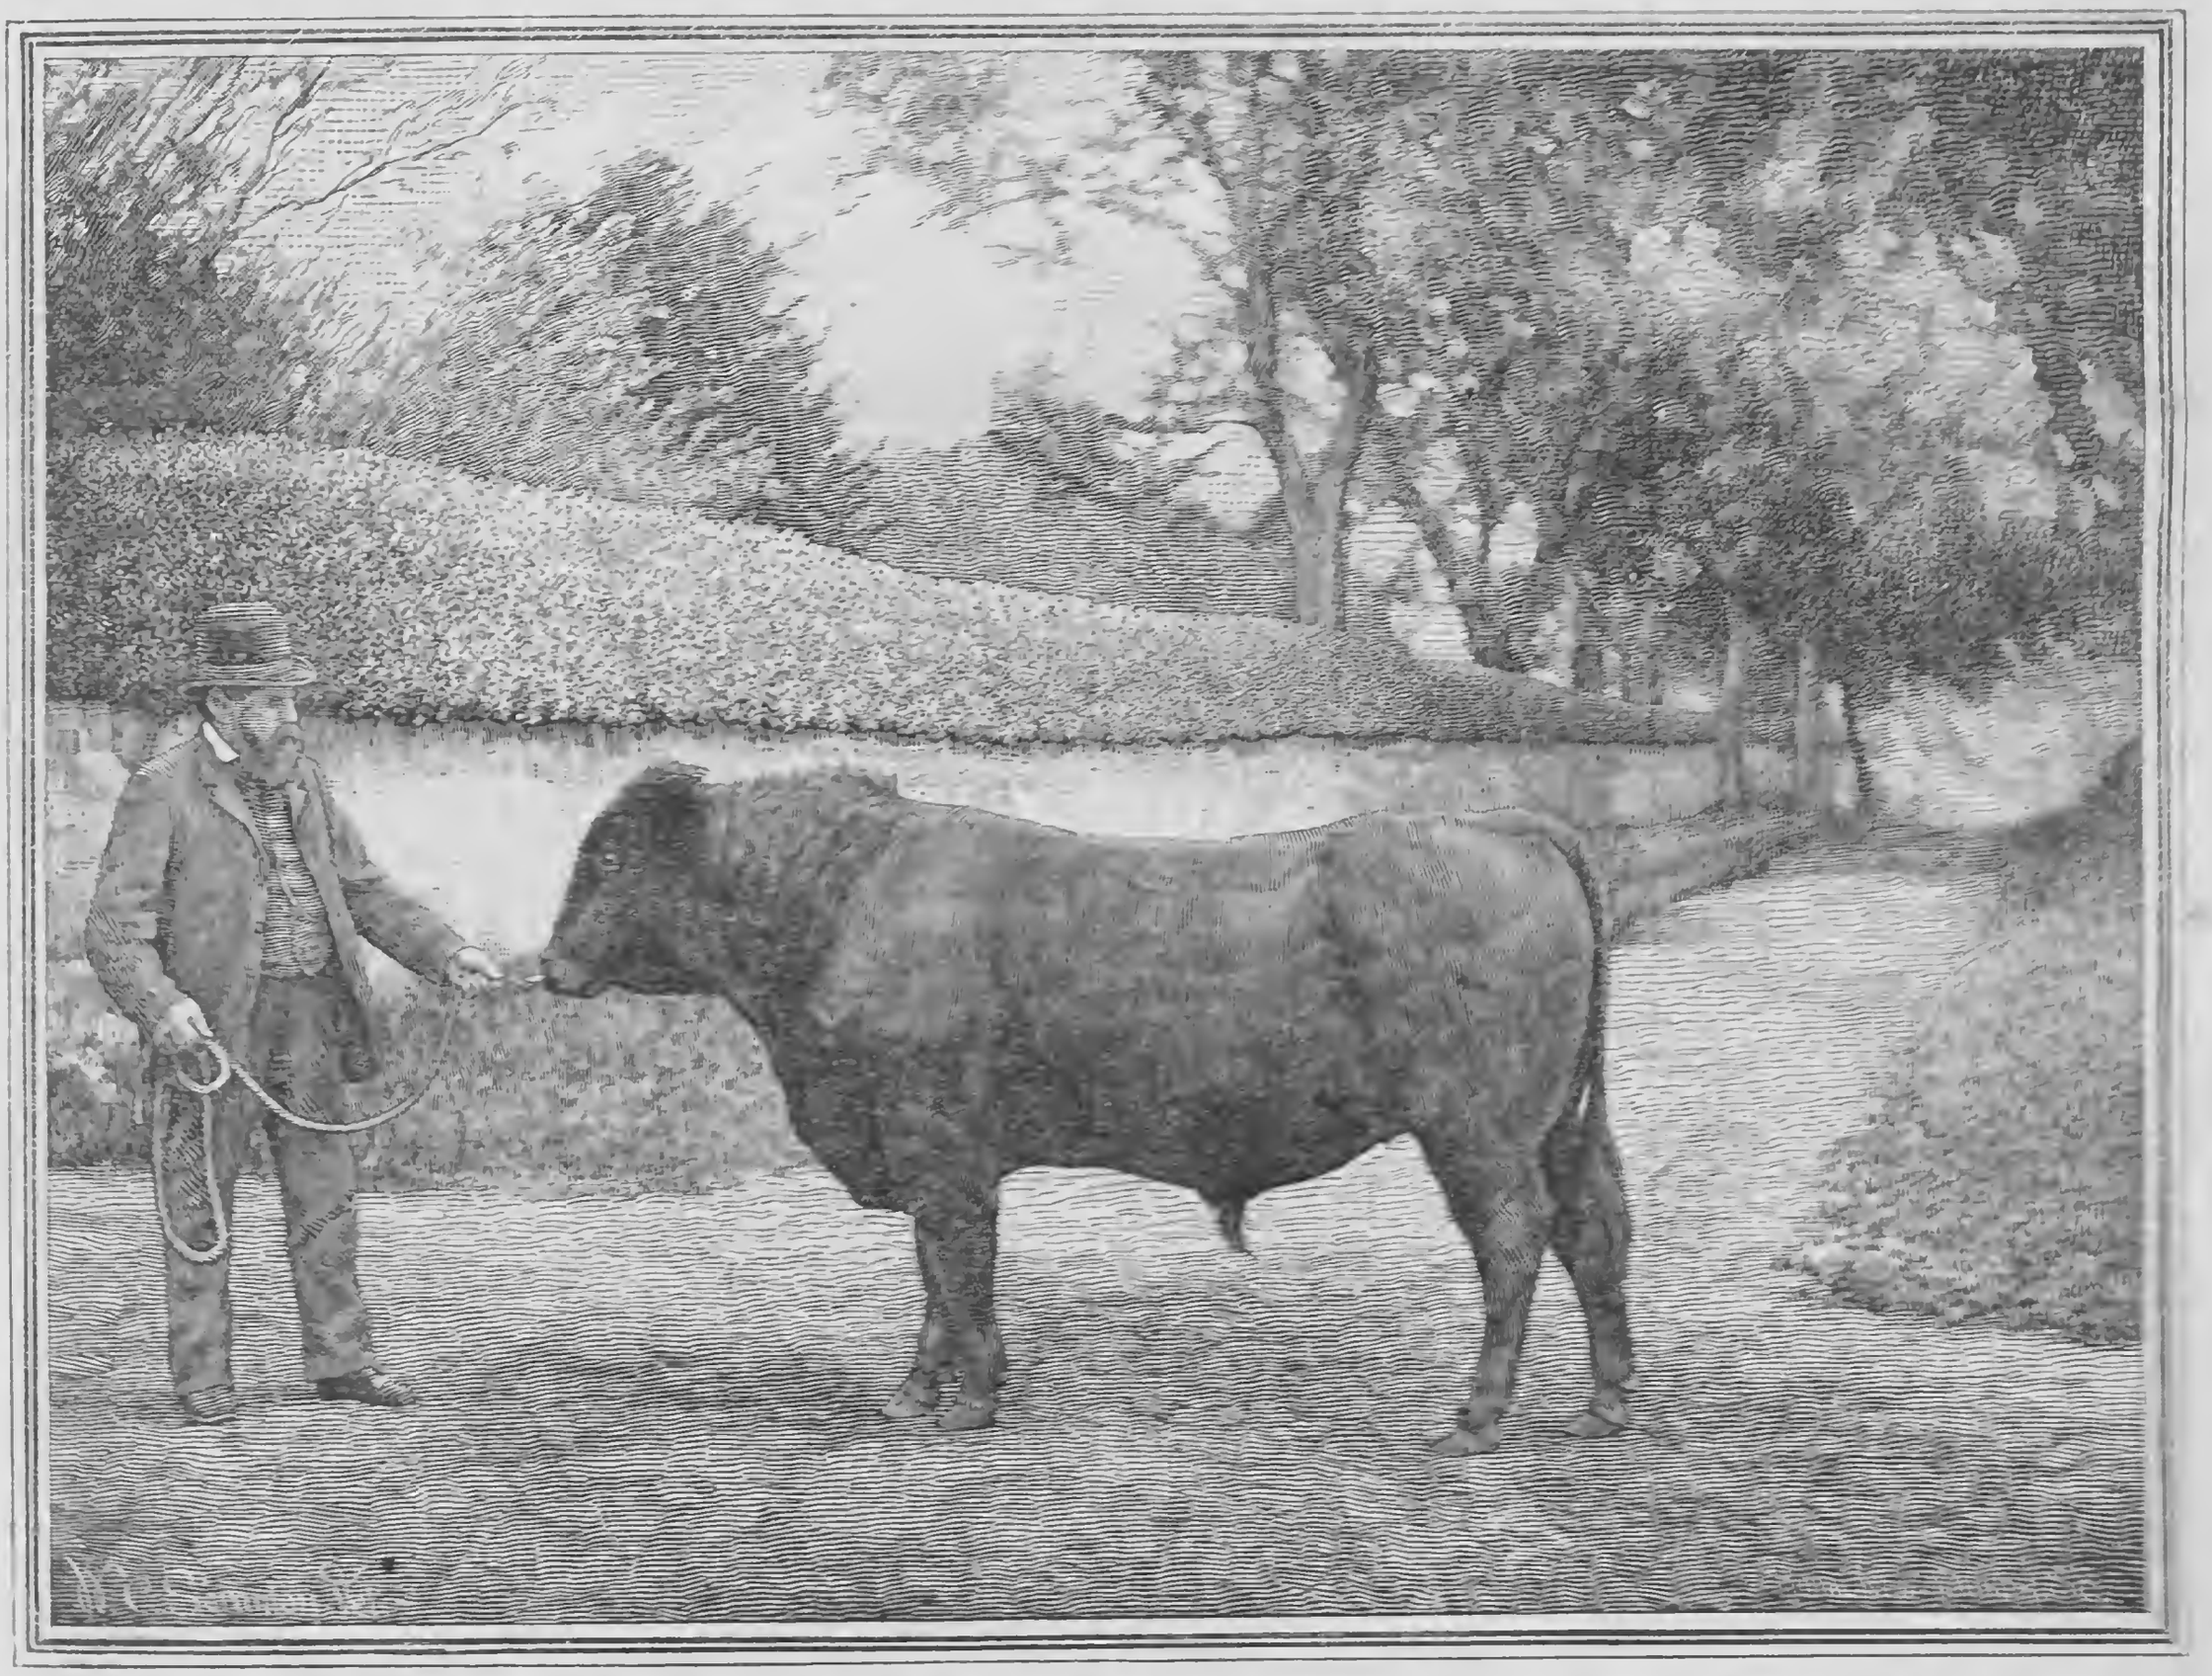
BY A STOCKMAN.

I CAN easily sympathize with the owner of a fine animal delivered over to the tender mercies of a country photographer who knows nothing about the points of a beast and is possessed of a little more than usual of the professional conceit of the average camera man. To take a good photograph of an animal requires the operator to be both an artist and a photographer, and it goes without saying that an artist should know all about the prominent points of the anatomy of an animal, at least so far as regards the balance of the limbs and extremities, and how these may best be represented in the photograph. I have had some experience in this business, both as a youthful amateur photographer years ago and more recently in the getting up of portraits of animals for engraving. Not one country photographer in a hundred, nay—I suspect—in a thousand, understands what is wanted. He has been used to taking human portraits and concentrating all his attention to focusing the face, or some central feature of it, regardless of the other objects, and generally succeeds in getting hands like legs of mutton and ears of elephantine proportions. When such an artist levels his camera on to a cow or a bull he is apt to focus the fore-quarters of the animal so as to get the head as near right as may be and to get as near a station as possible so that "each particular hair may stand on end" with great accuracy. After several abortive trials the patience of the owner, who can suggest nothing, because knowing nothing of the mysteries of the camera, is exhausted, and he submits as best he can to the failure with a lot of photo's which cause him to groan his teeth in spite and despair.

I would like to give a few hints to such owners. Let them procure a copy of one of Schreiber's (of Philadelphia) pictures and they will see a photograph "as is a photograph" and a study. In these the outlines are all preserved, and the lines really belong to the animal. What one may do another may, if he will use the same methods. The animal photographer should take in the whole animal; he should use a large lens with a long focus, and focus the centre of the figure and a little beyond it. It is not important to get any particular part with the greatest clearness; the general outline is what is most needed; the artist who copies the photograph for the engraver can fill in the detail, but he must have the outline exact. Then one will get a perfect portrait of the animal so far as the figure is concerned. The best photographs are made by first taking a very small negative on a large plate, making the animal the centre of the picture, and then enlarging it. In this way a very perfect representation of the animal is obtained. If the owner is able to instruct the picture-maker as to what he wants he can give many useful suggestions which will help the latter in getting a good portrait. As a sample of the way in which animals should be photographed I send you a photo of a polled bull the property of Mr. Ferguson, of Scotland, which might well be copied in facsimile for the benefit of your readers in this regard. The picture expresses more than I could say in a whole page.

POLLED ANGUS CATTLE.

THE accompanying engraving is a copy of a photograph of a bull of the polled Angus breed. These cattle have become prominent here of late since the large importations made by the late Geo. Grant, of Victoria, Kansas, and the more recent importations of Mr. Redfield, of Batavia, N. Y. The result of Mr. Grant's enterprise has been very satisfactory. The bulls have been crossed on the native Texas and the pure-bred Short-horn cows, with most decisive and agreeable effects. Since Mr. Grant's death two or three years ago the breeding of these cattle has been continued by one of his associates, Mr. Thomas K. Clark, who has a tract of eight square miles fenced for his ranch farm at Victoria. It was in 1878 that the importations were made and the past year the first grand success was achieved by the appearance of 80 polled cross-bred steers



"PRINCE OF THE REALM."—AGE 15 MONTHS.—POLLED ANGUS BULL.—From a Photograph.—Fig. 204.

n the Chicago stock y ards, where nothing bn the hard logic of cash is made the test of merit. All the sentiment in favor of a hornless beast with its powerlessness for mischief and its consequent amiability and general loveliness, counts for nothing in the butcher's eyes. He buys beef and not beauty, and has an eye to loins and chops and twists before quietness of disposition. Nevertheless, the drover has a word to say in this regard, and he finds the hornless steers are so easily handled and so quiet that he would rather have them at a little advance on the ordinary rates than the horned cattle.

Viewed then by the butcher's scale of merit, these 36 cross-bred steers at Chicago at once took a high degree. They were the first that had appeared in the yards and some curiosity occurred as to how they would turn out. They averaged 1340 pounds and dressed 62 lbs. to the 100; had 140 pounds of fat and 106 of hide apiece. The dressed weight is five pounds for 100 above the average, and equal to that of extra beeves. This result is encouraging to those who have spent money and time in introducing this breed as well as to those who desire to improve their stock.

Mr. Redfield, of Batavia, N. Y., is forming a herd of these cattle, having procured some choice animals from Scotland and from the same herd to which the animal belonged whose portrait is here given. There are many other herds in the country and some in Canada, and although there is an unaccountable prejudice against these hornless cattle, or, as they are called in the Scottish vernacular, "doddies," yet we believe they will surely grow in the estimation of breeders both for beef and the dairy. For as dairy cows this breed has a high reputation. One of the best cows the writer ever owned was a black polled beast, with a form and a frame that could not be excelled by a choice Ayrshire or Jersey; a coat of satiny luster and velvety softness and, which is most to the point, a credit of 12½ pounds of butter weekly continued for several months and upon very moderate feed. The absence of horns would remove the greatest objection that can apply to cows and bulls. There would be none of that constant fear and apprehension of damage and injury which now haunt the dairyman, especially the one who keeps costly cows. And it is a question worth considering if it would not be wise for the owner of a good herd to introduce this breed for the purpose of founding a race without horns especially adapted for the dairy. A cross-bred Jersey and polled cow, has been exhibited at the New Jersey State Fair for two years past, and in her looks at least, promises very well. There can be no doubt that as great success could be reached in this direction as has been achieved with beef cattle. The polled Angus is an old and thoroughly well established breed and has such a strong degree of prepotency that its cross-bred progeny at once lose the horns, and acquire the character of the polled sires.

Farm Topics.

COMPARATIVE VALUE OF CORN FODDER WITH ENSILAGE.

T. H. HOSKINS M. D.

THERE is a good deal of disputing, and evidently a good deal of gross misunderstanding on this important subject. Important it certainly is, when it is a pressing question in the minds of so many farmers whether they shall sow ten or twenty acres of Southern corn and build a silo this season, or not. Can ensilage be made to replace both roots and hay for neat cattle, either wholly or in great part? Is it a cheap as well as a good substitute? And is it likely to answer as a large and regular ration for cows, without injury to them, or their product in milk, butter or cheese? If all these questions cannot be answered in the affirmative, or until they can be so answered, the indebted farmer at any rate ought to "go slow." The "fancy" farmers often boast of the benefit they are to agriculture in the matter of experiments, and we old stagers and regulars in the business, who have seen so many agricultural humbugs rise and flourish and fade away, can just as well wait for the results in this case as in the others. We have our pasturage and our meadows, which we know give us good and healthy feed for our cows. We can raise corn, and feed both stalks and grain dry. We can buy and feed oil meal or shorts, or grow and feed oats, peas and clover to increase the nitrogenous ration; and we can grow roots. There is no trouble about having good feed and plenty of it, if we never build a silo. There is no urgency or need of hurry in the case.

There are serious objections to both corn fodder (the stalks of a crop grown for the grain) and fodder corn (corn stalks grown thickly for forage). In either of these forms the crop is a heavy one to handle, a difficult one to cure, is not so well relished by cattle as to be eaten clean, and it will not, when fed alone, like good early-cut hay, give a full yield of rich milk that will make first-rate butter. It is decidedly a second-rate feeding material for dairy cows, yet it is extensively used throughout the Northeastern States. On the other hand, there is no crop that will yield anything like as much feed to the acre, especially upon light soils, as corn. To the farmer of a few sandy acres, corn offers the only feasible feed with which he can compete in dairying with the owners of "natural grass land." It is this class of farmers, particularly, who are most interested in the subject of ensilage. The man whose pastures will carry a cow to every two acres, and who cuts an average of two tons of hay per acre in his meadows, is impregnably a dairyman if he choose, ensilage or no ensilage, grain or no grain. These two questions do not vitally interest him.

Are the acknowledged defects of dry corn fodder and fodder corn as feed for dairy cows *corrected by ensilage and not replaced by others equally great?* This is the problem before our light-soil dairymen. They know that green fodder-corn, especially when supplemented with a well balanced grain and oil-meal ration, will make about as good butter as the best pasturage. But when it has to be brought into competition as dry fodder with good hay, notwithstanding all that has been and can be fairly said in its favor, the prices of the two kinds of butter will invariably tell the story—"give me two tons of good hay and take my five tons of fodder." For milk alone—market milk—the difference is not so great; yet I know of no way in which as much, or half as much, milk can be made from fodder as from hay, no matter how you fix it.

There is good reason why this should be so. In the first place, analysis shows that the food is not there,—that chemically the value of dry corn-stalks is not equal to that of dried grass such as we make our cow hay of. In the next place, even if chemically as good a feed, it is not as palatable to the cattle. No matter how well it is cured or prepared they will not eat it clean, and if fed alone it will dry them off almost as quickly as straw. My corn fodder is handled with the utmost care, and stored upright in a large, airy shed loft with a sparred floor, where it cures perfectly without a particle of mold. I cut it fine, put it in a large tight box, wet it with hot water, sprinkle it with a bushel of mixed meal to every 16 bushels of cut fodder, and then I have to give the cows the choice of shrinking in their milk or wasting one-fourth of the feed. With early-cut hay and the same meal I get full messes and everything is eaten clean.

When green fodder corn is so good, why is dry fodder corn so poor, compared with the meadow grasses, green and dry? The reason is not far to seek. We dry our meadow grass into hay so quickly that the sugar and starch are very thoroughly retained without change. If on account of bad weather we fail to do this, we know the consequence—poor hay. It takes two months of the most favorable weather (and under cover at that), to dry fodder corn so that it can be piled horizontally without molding. In all that time the nutritious elements are undergoing "retrograde metamorphosis;" in plain language, changing for the worse. The sugar and starch will ferment, and escape into the atmosphere from which they were taken by the growing plant. A similar change takes place in the albuminous elements though to a less extent. But, taking both together, the value, judged either by analysis or feeding, is lessened from one-third to one-half, and often more. Corn may be as good as meadow grass when green, but (at least without artificial heat) you cannot dry it quickly enough to make anything like so good hay of it.

Now comes the question—is ensilage a remdy for this evil, and one coming to us with no evils, or much slighter evils, of its own? The analyses that have been made of well preserved ensilage (and I think experiments have sufficiently proved that such preservation is easily practicable) show some little loss of sugar and starch by transformation into alcohol and acetic acid. This loss is well balanced by the action of the same fermentation in rendering the woody fiber more digestible. It is possible that a very slight amount of alcohol and acetic acid in this feed may, as is claimed, promote digestion, favor assimilation, and thus increase the secretion of milk. But as only a little is needed for that purpose, and as much is certainly bad, I think we should aim for a minimum of fermentation in ensilage. Fine cutting, thorough treading and strong compression will secure this in a properly constructed silo. We may calculate, with safety, that ensilage in the silo will cost no more than fodder corn in the barn. It will cost no more to feed it out. It will need no more meal to be fed with it for a full flow of milk. All testimony shows that it will be eaten up clean. These are certainly great advantages. What are the drawbacks as we see them now? First the cost of the silo. If the farmer must borrow money for this purpose, then I would say "Don't—Wait." If he is out of debt with money on hand, I would say, "begin small." Make a small silo (but a good one), and try one or two acres of corn to begin with. Learn the art, and try the feed on your cows one or two years first, before making up your mind to feed chiefly on ensilage. Shun everything like excitement over this matter. Take no stock in statements of 40, 60 and 80 tons of fodder on an acre. Twenty-five tons are a good crop, only to be got on good land with careful tillage. With such a yield and good calculation the crop may be got into silos at a cost of not less than two dollars a ton everything counted in. Do not reckon the value of this feed too highly. Many enthusiasts call two tons of it equal to one ton of hay. So some men call one bushel of carrots and one bushel of oats equal to two bushels of oats for a horse. But it is only in a special and limited sense that this is true. And so of ensilage. As a variety food, like roots, in small quantities in Winter, it might replace hay when fed in the proportion of two to one. But as a steady, regular main ration, the proportion of four to one would be much the safest to reckon upon. This, with a 24-ton crop, would give the equivalent of six tons of hay to the acre at a cost of fifty dollars. This does not mean wealth untold, or butter at ten cents a pound, but it is very much better than our sandy-land farmers can realize in any other way, and therefore it is worthy of a careful trial by those who wish to follow dairying on that kind of land.

DRIVEN WELLS—HOME-MADE FERTILIZERS.

MR. J. S. WOODWARD in a late RURAL, in writing about the water supply on farms, mentions "dug and bored" wells. They are both good—and expensive in comparison with a "driven well." I "drove" a well this Winter and it has given me such a large supply of water at such a small cost, that I think if farmers generally knew of this plan, there would be fewer cattle driven long distances to water next Winter. My well, including a good force-pump, cost me exactly $21 50 in money, and the labor of two farm hands for, say, half a day each; depth of well, 30 feet. In this style of well the only danger is in striking a rock, in which case the pipe must be pulled up and you must try again. I used 1¼-inch pipe; but 1¼ inch would do; but the former gives such a good supply of water and the additional cost is so light that I would advise its use. The pipe can be driven with a 25-pound sledge, or heavy maul. At first—the time varies—the water will be very muddy until all the fine particles among the sand or gravel at the lower end of the pipe have been pumped out. After the reservoir below has been freed from all matter that can be pumped through the strainer at the bottom of the pipe, the water will be as clear as any well water. Mine, although driven over two months, is still throwing up great quantities of mud; but I hope soon to have it all right. For watering cattle it does well enough, as the mud settles in the trough very quickly, much more quickly than ordinary soil mixed with water would do.

[Probably the "filter section" of our friend's pipe is partly sunk in a mud layer, and the water would soon become clear, if he either sank it a little lower or pulled it up a trifle. Experiment would show which should be done. Farmers should remember that the "Driven Well" is still covered by Green's patent, and one of his ubiquitous agents is likely to call for royalty upon all owners of "driven wells" who have put them down without license.—EDS.]

I think you hit the nail squarely on the head when you advised an inquirer in a late issue to feed purchased food to cattle and make his own fertilizer. It is my idea exactly, and I am working it out this Winter, and if your inquirer could go into one of my cattle stables and smell the ammonia made from cotton-seed, linseed and "corn-seed" meal, he would prefer that kind of fertilizer to any other. You can't preach too much on that subject. Feed everything you can on the farm, and if you don't get quite as much money as you would by selling, you will find the account *more* than balanced by the saving in fertilizer bills; besides, as you say, one ought to get full value for home-grown food as well as for that purchased, in the increase in growth or fat of his cattle."

Baltimore Co., Md. A. L. CROSBY.

TO PRESERVE SHINGLES.—Referring to a late inquiry on this topic in the RURAL, a correspondent writes to us from Hot Springs, Ark., that an excellent preservative of shingles is a strong solution of salt and lime. Make this in a water-tight box or other receptacle, never mind how rude, and steep the shingles in it for a few hours, and they will last much longer for the treatment, will be nearly fireproof, and will give no bad taste to the water from the roof when collected in a cistern.

Field Crops.

WHAT SHALL BE OUR BEST WHEAT?

HUGH L. WYSOR.

I PUT the question in this form because it affords an opportunity to inquire what qualities in a variety of wheat shall constitute it the best. In general terms, the answer might be, that is the best which shall please both miller and farmer. To please the farmer, it must be certain and prolific; to please the miller, it must be a good yielder of a high grade of flour. Looked at in this light, our best wheat either does not exist, or is not yet offered for sale. The three essential things, then, which the coming wheat must possess are these:—Certainty, which includes earliness, power to resist rust and winter-killing; prolificness, which includes tillering power; and flour-making qualities.

Of all the varieties which have been introduced to the public notice with great blast of trumpets within the last twenty years, only three have proved generally popular. These, in the order of their introduction, are—Boughton, which goes under various names (Tappahannock, New York Flint, and perhaps, also the Early May, of the South); Red Mediterranean, with which might be included the Lancaster, as they can scarcely be told apart; and the Fultz. Some might say that I ought to include the Clawson in this list, but, until within the last year or two, the Clawson has never been very extensively sown or proved very successful outside of its native State—New York. Of the three, the Boughton, as grown here, has never been equaled and can never be surpassed in its flour-making qualities; the Red Mediterranean is the most certain, and the Fultz the most prolific. The wheat of the future must be looked for, if anywhere, among crosses of these three. It will be useless to produce a variety of wheat with long ears, even if they be a *foot* long, and with spikelets containing three and four kernels, if a good crop cannot be produced from it except in favorable seasons or one in every three or four years. For this reason, notwithstanding the favorable opinion which the editor of the RURAL has expressed of it, there is nothing to be hoped for in the Silver Chaff, or in the Winter Defiance, for they both have one fatal failing, if no other—*they are ten days too late.* In a period of ten years, the Red Mediterranean, which has never, or seldom, been known to exhibit more than two kernels to the spikelet, will have yielded as much grain as the Fultz, which frequently exhibits four; for the former will have given a fairly good crop every year on all sorts of exposures, northern as well as southern, while the latter will have given only three unusually good crops out of the ten. I give below a little table which by means of figures, taking five as the highest grade of merit in any particular, shows the comparative merits of some of our varieties.

Name of wheat.	Certainty...	Prolificness.	Flour making quality.
Boughton	3	4	5
Red Mediterranean	5	3	4
Fultz	4	5	2
Clawson	3	4	2
Fultzo Clawson	4	4	*
Silver Chaff	1	5	*

* Not known.

It is a little remarkable that just as the RURAL has concluded that the Fultz is a better and more prolific wheat than the Clawson, the people of this State have come to the opposite conclusion, as I learn from the report of the Virginia Commissioner, who says that numbers of farmers all over the State have discarded the Fultz, which they have been growing for six or seven years, and are sowing in place of it the Clawson, believing that they will reap better crops from the latter.

Golden Grains—Black-Bearded Centennial.

I have no personal knowledge of either of these two wheats, not having tried them. The Black-bearded Centennial is said to have originated in Australia, and was distributed in the Fall of 1879 by the Department of Agriculture. From this source the Virginia Commissioner received half a bushel, which he says was sown rather late. The yield was nothing remarkable, being only about five bushels of a quality inferior to that received. Of the Golden Grains I have received a sample from Messrs. Burpee & Co., who have it for sale. Messrs. Bliss & Sons, Gregory, and Landreth also offer it. All of them, except Landreth, say that the introducer offers $50 for any white wheat which will equal it, and then say on their own authority that he is perfectly safe in making this offer, for the kernel is fully *three times as large as that of our best common wheat.* Why these gentlemen should say this puzzles me not a little, for I know them all to be honest and reliable men. The Red Mediterranean, as I have said above, is one of our most common wheats, and a kernel which should be three

times as large as a kernel of this would be a monster indeed. From the sample sent me, I should say that the kernels of Golden Grains, while they are shorter and thicker than those of the Mediterranean, would not weigh any heavier or but slightly so at any rate.

Pulaski Co, Va.

REMARKS.—WE had not intended to say that Fultz is *better* than Clawson; but more prolific at our farm owing to its producing more kernels in the spikelet. We have about five acres in Silver Chaff which we have sown in preference to Clawson which we have raised as our main crop ever since this wheat became known. Our Winter Defiance may prove worthless. It is, as Mr. Wysor states, very late. We had hoped it might change in this respect. The claim that Golden Grains produces the largest kernel, etc., is evidently a mistake, since the kernel of Black-bearded Centennial is so nearly like it in color, shape and size that one cannot be distinguished from the other.—EDS.

TOBACCO CULTURE.—NO. 7.

G. A. GOFF, JR.

The Tobacco Barn.

IN the early days of tobacco growing in our valley mere sheds of rude and temporary construction were used for curing tobacco. These have been replaced as the business has grown in favor by permanent buildings, constructed for the purpose on scientific principles. The barn that I shall describe is the tobacco barn in popular use at present by our best growers. The size of the building must, of course, be governed by the amount of tobacco to be cultivated. A barn large enough to cure three acres of tobacco should be 64 feet long and 28 feet wide. The posts should be 16 feet long from shoulder to shoulder; 6x8 inches will do for the size of the posts and tie beams, and 8x10 for the sills. The plates may be somewhat smaller—say 5x8 inches.

Such a building will hold three tiers of plants after they are hung, leaving five feet between each two tiers. By having the posts two feet longer and setting the sills well up from the ground, another tier may be added. This is often done, but it is objected to by many from the fact that the tobacco in the upper tier, being far from the ground, does not dampen readily when it is wished to take it down. The side beams or girts are four by four inches and should be placed four feet nine inches or five feet apart to give sufficient space between the tiers for large tobacco. The poles on which the tobacco is hung are two and one-half by five inches and 14 feet long, and while in use, when the usual method of hanging is followed, are placed about 16 inches apart. The outside is boarded up and down and the cracks battened. Ample means for ventilation should be provided by hanging every third or fourth board on hinges, thus making perpendicular doors, which are provided with locks and staples to fasten them shut or open. The space beneath the sills should be fitted with horizontal doors hung to the sills. Ventilators are placed on the top of the building 30 or 40 feet apart, to aid in the ventilation. It is highly important that a tobacco barn should be so constructed that it may admit of being tightly closed when necessary, or opened to admit the air freely at the will of the grower.

Double swing doors on each side of each end are most convenient. One pair may be made to answer, however, if the lower middle girt next the door is framed so that it may be readily removed to admit a team and wagon to the other side. A tobacco barn should stand in a dry, airy situation, away from trees, which sometimes prevent a free circulation of air and cause the tobacco to pole-sweat. A good tobacco barn is a necessary appendage to a tobacco farm. Too much tobacco has been hung for curing, in years past, in grain barns and other buildings unsuited for the purpose. Tobacco hung in such buildings rarely cures as well as that hung in properly constructed tobacco barns. Too close hanging is also a fault with many growers. Tobacco should never be crowded in curing if the best results are to be expected. Too thickly hung it will often pole-sweat while curing and thus become seriously damaged.

The Assorting and Stripping Room.

Not less important than a suitable tobacco curing barn is a capacious and comfortable tobacco stripping and assorting room. It should lie adjoining or adjacent to the curing barn. The best assorting room is constructed and furnished with an eye to comfort and convenience. It should be not less than 18 feet square, as it is desirable to keep a quantity of tobacco and a number of cases in it, and yet have plenty of room for work. A bulking or packing room is sometimes partitioned off from the main room, in which to store a quantity of tobacco while it is being assorted. This room should be made tight so that when the tobacco is too dry to be handled nicely, it may be steamed by passing steam generated in a small steamer, made for the purpose and set on the stove, through a pipe into the inclosure. A good stove should be used in the assorting room in which a fire may be kept over-night when desired.

POA COMPRESSA.

BLUE GRASS, WIRE GRASS, FLAT-STEMMED POA.—This is another common grass with short stems. It well deserves the name "Blue Grass," by which it is often known.

FIG. 205.

The whole plant has a dark bluish green tint. The stem is quite flat, so it will not easily roll between the thumb and finger. This mark alone will enable any one to distinguish this grass from Poa pratensis (June Grass), which also goes by the name of "Blue Grass" in Kentucky, and, more recently, in many other portions of this country. I hope the name "Blue Grass" may be reserved for Poa compressa. The grass is a common one, found in dry meadows or pastures, especially where the soil is inclined to clay or gravel. The growth is short and thin, and it flowers about a month later than June Grass. The panicle is rather small and dense; the leaves rather short. The stems remain green for a long time after the seeds have ripened. It shrinks less in curing than any other grass with which I am acquainted. The stems are almost solid, *i. e.*, the wall is so thick that the hole in the center is quite small. A scythe is much gummed in mowing. All who know this grass agree that it is one of the richest and that no grass makes a better or richer hay. The grass is a perennial, but does not spread rapidly by its root-stocks as is the case with June Grass and Quack Grass. It never forms a close turf and is not difficult to eradicate when once well established. PROFESSOR W. J. BEAL.

Growing Potatoes Under Straw.

The ground was broken in the Fall of 1879 and in the Spring of 1880 it was harrowed and made fine, then furrowed not very deep, 3½ feet apart. Potatoes of medium size were cut once and dropped in the furrow 20 inches apart. On one acre of ground I spread 100 bundles of rye straw, of the estimated weight of 550 pounds, over the potatoes dropped in the furrow, and then with one horse attached to a one-horse Syracuse plow, a light covering of earth was turned over on the straw and potatoes. The season being so very dry, the straw did not all "mulch," and the result was not as good as it would have been if the straw had all rotted and made a bed for the young potatoes. The results, however, were in favor of the rye straw, as the yield on that acre was 25 bushels more than on an acre alongside of it prepared in the same way, but on which no straw was used. Now, the rye straw used on potatoes in this way is, I claim, worth more than it would be if hauled to the paper mill and sold at $20 or even $25 per ton. Moreover, the potatoes that grew under the straw were larger and much smoother than those grown where no straw was used. Some people think that the potatoes will not come up under the straw; this is a mistake, they will grow sooner in this way if properly covered. I have also covered potatoes in the hill with coarse manure and have had good results.

Horticultural,

RURALISMS.

I HAVE just received (March 26) several back numbers of the RURAL, (our postmaster probably likes it,) and among them that of January 15, containing Kit's inquiry about pot-grown grape-vines. It may not be too late to answer his queries briefly. The brevity of these "Ruralisms" makes it quite impossible to go into detail, which I should like to do; but I will try in a few words to make Kit comprehend my views of the subject. Just as poor vines can be, and are, grown in pots as in any other way, even the poorest; on the other hand, a skillful propagator can grow better vines in pots under glass than he can grow in the open air from cuttings. I have tried so many thousands in these and other ways that I know it; and, in addition, the best vines I have ever seen grown by skilled professional men have been grown in pots. Kit also asks why the pot-grown vine is better, and in what respect. It is better because it can be started earlier, has a longer season to grow in, is more under control, makes better wood and better roots, carries better, bears exposure better, and is easier to plant. The roots are not in a more natural position, but they are in a better position to make fibrous or feeding roots and until these are made no growth takes place. I am now speaking of *well-grown* vines; but a man who grows the Delaware and the Concord, for example, in precisely the same way in pots will generally make a failure of it.

Kit's corkscrew vines may do very well to draw corks with, but I should be loath to plant them to get the wine to put in the bottles. No, Kit, those are not the kind I referred to, and you were right in supposing they were none the better for it. Let me make one more statement, and I will keep quite within bounds in making it. I have planted or directed the planting of more than twenty thousand vines, and the result has always been so much in favor of well-grown pot vines as to leave no doubt in my mind as to their value. But I must add that I have always selected the vines myself, whether grown in pots or in the open air, and have never been satisfied with either till I have seen the roots. It must not be supposed that I am in favor of coddling the vines, for most decidedly I am not; neither must it be supposed that I am prejudiced against vines grown in the open air, for, again, most emphatically I am not. I know too much about the vine to entertain any such nonsense as that. But I must break off in the middle somewhere, though I have not said half that I wanted to. Now, Kit, suppose you take the chair, and let me ask a question. How should a first-class pot vine be grown? You cannot get off under the plea that you are "so much of a novice." Your manner of putting questions shows that you are "no such thing."

IN the number for January 15 I also find an excellent portrait of Mrs. Brett's seedling Peach. I have eaten this Peach from the tree, made some favorable notes in regard to it, and wish to add my testimony to Mr. Downings's in regard to its goodness. I am the more anxious to do this because I had submitted to my examination during the same visit five or six other peaches, and this was considered the best of them all. Two of these were comparatively new foreign peaches highly spoken of in England, but which do not seem to be well adapted to our climate, and another a Southern seedling which is thought to be very good in Georgia, but which is hardly second-rate here at the North.

A FEW days since there appeared in the city papers an account of the poisoning of a family at Troy (I think it was) from eating pork and beans. It was at first supposed that the pork contained trichinæ, but on being analyzed by a chemist nothing of the kind was found. On examining the beans, however, the report says "black insects" were found on them. The "black insects" were probably the bean weevils. A large seed firm in New York last Winter (1880) furnished me with a sample of beans very badly infested with these weevils. I made inquiry of all our principal seedsmen, examined their stock, and as the result found that the only bean thus affected was the Early Valentine. I found only two lots thus affected, and as far as I could learn, they were both grown in the same locality, showing that thus far this weevil is local. These beans were destroyed, but there were, no doubt, other lots elsewhere in which they were not discovered. These cases of poisoning give the subject a very grave importance, and it should receive prompt attention from seedsmen and seed-growers throughout the country and it would be well for all who use beans to give them a thorough examination. These bean weevils were first seen, I think, about five years ago, but were supposed to have disappeared. I had some Lima beans from Peru, S. A., about twenty years ago, which I found to be full of weevils; but I destroyed beans and all as soon as the discovery was made.

LAST Fall I warned the readers of the RURAL against some peddlers who were vending fabulous lilies at fabulous prices; and I also denounced them in the neighborhood in which they were at the time operating. I have since been thanked for doing so. Several sales, however, had already been effected. A few days since I saw one lot of them which have been carefully grown in pots during the Winter. They are all Lilium candidum, the common white garden lily. It is, to be sure, one of our most beautiful lilies, but eleven dollars seem to be rather a stiff price to pay for three

BLUE GRASS—POA COMPRESSA.—FIG. 206.

bulbs which can be bought of almost any florist for twenty-five cents each. They were sold under outlandish names, that were neither Latin nor Hottentot, represented to be of different colors, and sold at different prices, a handsome deduction being made for the collection, and this last seems to have been the bait that caught the innocent little fishes. When will people learn to let these peddlars alone? There will be more about this Spring.

HORTICOLA.

SPRING VEGETABLES.

Peas—Cabbage—Lettuce—Radishes—Onions—Beans—Salsify—Parsnips—Beets—Carrots—Peppers—Tomatoes.

JAMES TAPLIN.

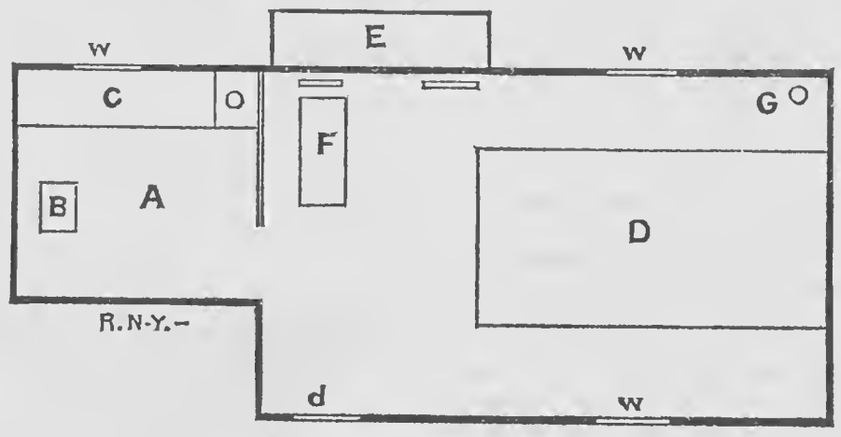
IN growing vegetables, whether for home consumption or for market, it is necessary to have the ground in good condition, well manured and cultivated deeply. For early vegetables a dry, warm soil is needful, as in cold, wet soil the plants will die and the seeds rot. This is especially necessary in seasons when the ground is saturated with water, and on wet, cold soils it is useless to sow or plant very early. For early crops it is advisable to cultivate and even manure the soil before frost, so that little is needed before sowing; but that is only available on very light dry soils. The first crops requiring attention are early peas, cabbage, lettuce and radishes. Lettuce and cabbage should be raised in frames if required very early. Cabbage especially should be autumn-sown, and transplanted into good, rich, well cultivated ground as soon as frost is over. Onions should also be sown as early as the ground will permit. For this crop the ground cannot be made too rich. Chicken manure or night soil is the best for this purpose, but it is necessary to have the soil thoroughly dry when the seed is sown. If that condition prevails even in March, it is best to sow, as, although the seed is a long time in the ground, it comes up stronger than when sown later. The earlier peas are sown the better as they stand the dry weather better than when sown later. I have seldom found that peas are a satisfactory crop after the 4th of July as they mildew and die off without bearing. Another thing, I may note that peas should always be sown at least four inches deep, as they come up stronger and do not burn so quickly. The ground should be made quite firm over the seed. As regards varieties of peas, there are new kinds every year, more or less good, and for those who can afford to try experiments, it is well to do so, but I usually grow only two varieties, Daniel O'Rourke and Champion of England. These two kinds planted together, keep up a succession of bearing until the very hot weather. As soon as Daniel O'Rourke is over, the Champion of England is ready. If the ground is naturally very dry, it is well to leave the drills a trifle lower than the surrounding ground, so the water may collect there, or they may be watered artificially if desired. In sowing onions, it is well to put them in drills about fifteen inches apart. The ground may then be hoed, so there is very little weeding. Broad beans are vegetables the Americans do not usually care for, but they are very popular with the English. They should be sown very early on stiff cold soil. For those fond of this bean it makes a welcome variety before the bush beans come in. Salsify, parsnips and a little early beets may be sown as soon as the ground will permit. A few Horn Carrots may be sown in a light dry border, as I think small early carrots are much superior to the large late ones. Lettuce seed may be sown to succeed that transplanted. As regards varieties, each one usually has a favorite sort, and among so many good ones, it is hard to choose, but on rich, moist soil, I consider the French Cos much superior to the cabbage varieties, though it is not much grown in this country.

Parsley should also be sown in rich soil, although the best plan is to sow in August in a frame and transplant in the Spring, as the seed is very long in coming up. Although much of it will run to seed, there are many plants which do not do so, and it gives a good supply of parsley until frost comes.

Tomatoes should be sown in a warm frame. I have not found much advantage in sowing before the first of April, unless there are unusual facilities for growing them on; as a rule, they become overgrown and weakened before they can be planted out. As regards varieties, there are many good ones, but I myself prefer the Acme. Some peppers may also be sown in a warm frame. Some onion setts, shallot, and garlic, should be planted if required, as the earlier they are planted the better. Any old large onions which are sprouting are very useful if planted now; all the trouble required is to make a shallow drill, and just stick the onions in. They give a good supply of onions before even the setts are fit for use.

Raising Vegetables.

WINTER SQUASHES, like many other vegetables, I raise as a second crop following early beans. They are both planted, however, at the same time—the squash hills about 15 feet apart. These I make by digging a hole about the size of a bushel basket and putting in a liberal supply of well-rotted manure, covering the whole with about four inches of earth. The beans I plant in rows between the squash hills, and they are gathered before the squashes occupy the ground, and sold as string beans. In this way two valuable crops are raised on the same ground, and it is a very pleasing sight to see the bean patch about the middle of July suddenly transformed into a bed of squashes. I dislike to see bare ground in a garden in Midsummer, and there is no need of it if a little forethought is used.



PLAN OF CREAMERY.—FIG. 207.

CABBAGE PLANTS may be set very late, even as late as the last of July, to fill in empty places, and if they do not make solid heads I dig a trench and bury their roots, fold the outside leaves over the heads and cover them with nothing but earth, and in Midwinter or Spring they will come out first-quality cabbages. The plants that I use so late I transplant once or twice and leave them in the nursery bed six inches apart, and when I wish to use them I take them up with a spade, leaving as much earth as possible on the roots, and if it is a wet day they will hardly feel the change.

TURNIPS—the common field or flat sorts are perhaps the latest vegetable that can be used as a second crop. These I have sown as late as the 10th of August, and got a fair crop. I give the ground a coat of wood ashes, sow them in drills and hoe once. Many sow them broadcast and never hoe or thin them, and consequently they get a crop not worth harvesting. What is worth doing at all, is worth doing as it should be done.

Oneida Co., N. Y. ADELBERT WAKEFIELD.

Dairy Husbandry.

THE DAIRY COW—NO. 30.

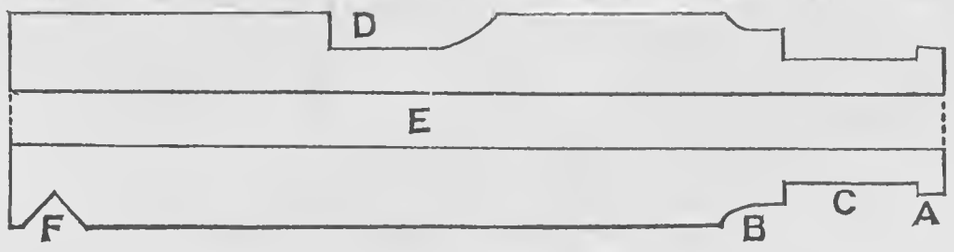
HENRY STEWART.

Creameries.

A CREAMERY is a co-operative dairy. What the cheese factory has been to the cheese dairy the creamery has been to the butter dairy. As the former has raised and equalized the character of American cheese, so the latter has improved and made more even the quality of American butter, so that instead of a great variety of butter all differing in degrees of badness, from thousands of farm dairies, all kept under less or greater difficulties, we now have a well recognized grade known as "creamery," which is all that can be desired for ordinary consumption. The creamery, in fact, not only takes out of the hands of a number of overburdened farm housewives a labor which was too great and too exacting for them, and does this work at a far less cost of time, labor and materlal; but it takes the work from a good many incompetent persons and provides the best skill and the best apparatus for its completion. The increased value of the dairy cow and the enlarged receipts from the dairy which have been realized through the establishment of creameries, are of the greatest importance both individually to the dairymen and collectively to the industrial interest of the nation. It is a well-known fact that an improvement in the quality of a staple article of food greatly enlarges its consumption, notwithstanding the increase in price which is in proportion to its increased value. It is from this result that Western dairymen now enjoy a very material improvement in their incomes; for while a few years ago, when creameries were unknown and dairymen labored under many disadvantages of climate and locality, the price of Western butter was the lowest current in the market; for the past few years, since the introduction of creameries, Western butter is now at the top and ahead of the best Eastern products which come on to the market. Western dairymen, too, have carried off the first premiums for butter at dairy exhibitions and many Western men now enjoy enviable and world-wide reputations, who would have remained unknown but for the introduction of the creamery system.

The creamery system is of general application and may be made available both for the associated dairies, and for large single dairies. Its greatest and most effective development, however, is through association, by which a large number of farmers and small dairymen may enjoy all its benefits. There are creameries which work up the product of several hundred cows and are patronized by fifty or more separate persons. Some are owned by private individuals who purchase the milk or the cream, and some are co-operative and contribute the milk on joint account and divide the proceeds *pro rata*. For several obvious reasons the former is the better plan, whether the owner be a single individual or a joint stock company formed from among the patrons. Those who deal with the creamery then know each day precisely what they are entitled to for the supply of so much milk at a stated price. Certain restrictions and regulations are enforced and observed in respect of the feeding and management of the cows and the care and delivery of the milk, so that the milk shall be of even and good quality and be delivered in satisfactory condition. Creameries are usually combined with cheese factories, so that the skimmed milk may be turned to profit, either in skimmed-milk cheese or in the mixed and artificial article known (generally *sub-rosa*, however) by the despised name of oleomargarine cheese. There is no doubt that a very large amount of this material is worked up into cheese in creameries, of which nothing is said or heard. This is neither the place nor the opportunity to discuss the merits or demerits of this business; but in describing the creamery system it is necessary to make a passing reference to it. Cheese is made in this way that it will puzzle the wisest expert to distinguish from full-cream and truly honest cheese, and no means of detecting the difference can be relied upon excepting the microscope. The business has reached such large proportions, and exists under such peculiar conditions, that there seems to be no means of interfering with it, even by legislation, unless it be of a special kind which would be inoperative. Those who expect to become interested in creameries therefore will find their attention turned to this subject, whether they will or not, as being a part and parcel of the creamery business. Where creameries are confined solely to butter-making, the skimmed milk is returned to the patrons who dispose of it in their own way.

The apparatus of the creamery consists of the vats or pails for setting the milk, the cream vats and the churns. A large variety of milk-setting apparatus is in use, both for deep and shallow setting, for each of these systems has its advocates. Ice is used for cooling the milk in the warm weather, and is in fact indispensable when the best quality of product is desired. It is not only valuable as a refrigerator, but its use economizes time and material; for at the low temperature at which the milk is set—usually about 45 deg. in the deep pail system—all the cream is raised in 12 hours or less, so that but half so many pails are required as in ordinary setting. Deep setting also requires much less space than shallow setting, and this economy of space lessens the necessary amount of floor room in the creamery, which, of course, reduces the cost of the building. The cost of the necessary apparatus for a 600-cow creamery, with cheese-making furniture complete, including a 6-horse power steam engine and an 8-horse power boiler, amounts to about $1,500. The cost of a small creamery for butter alone for 80 to 100 cows would be little more than $350, including the building, if the deep pails be used, and strict economy be exercised.



AN IMPROVED SAP-SPOUT.—FIG. 208.

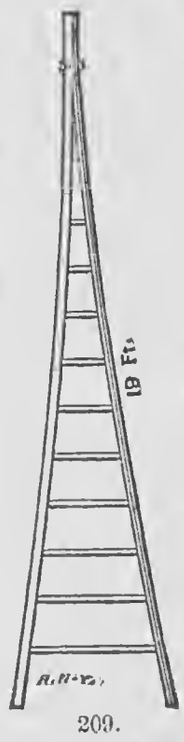
The accompanying plan, Fig. 207, is arranged on this low basis of cost and consists of the following:—a frame building with double walls, the studs being six inches wide and covered under the boarding with air-tight roofing paper. The outside is of novelty siding which lies close upon the studding; the inside is sheeted with narrow, matched stuff. This gives a sufficient and perfect air-space which equalizes the temperature. The main building is 13x21 outside, has two windows, w, w, and one outside door, d. The annex, A, is 9x9 outside and has an arched passage-way but no door; in this is a water heater, and a sink provided with a pump; a window over the sink lights this wash-room. The main room contains a pool, D, 6x12, which holds 120, eight-inch 14-quart or 30-pound pails, 20 inches deep. This will be sufficient for nearly 100 cows and it is best to have the pool of ample size rather than barely large enough. The pool or vat should be built up of cream-colored brick laid in cement and if not wholly sunk in the floor, should be inclosed in a pine-plank frame strengthened with two three-quarter-inch galvanized iron rods passing from side to side and held by washers and nuts on the outside of the frame. A raised vat will be found more convenient than one sunk in the floor, as stooping will be avoided. A one-horse power is placed under a shed, E, with the driving pulley brought into the building; a belt from this works the churn. The butter-worker may be kept in the wash-room. The whole floor should be of matched pine with the joints calked and the boards well painted; the floor should incline one inch from the sides to the center, where a wide groove or narrow gutter should lead the drainage to a pipe under the sink where it escapes into the trapped drain. A pump to supply water to the vat if needed, may be set near the vat and worked by a belt from the horse power. Both the pumps may be connected with one well near the house, if running water is not available. This plan may be adapted to small private dairies, and the smallest dairy may be arranged in a similar manner. A hanging rack above the vat may be provided to hold the spare pails and utensils that are not in use so that the space occupied by the vat will not be lost. A ventilator should be made in the roof and the building should have half a story above the main floor to aid in the ventilation. An extra pump should be located at G.

Farm Economy.

A Convenient Ladder.

In a late number of the RURAL was described a ladder for picking fruit. Believing it to be both the duty and the privilege of your readers to *confer* as well as to accept good things, [we wish all of our subscribers took this view.—EDS.], I herewith send you the plan of one that I have used for a number of years, not only in climbing trees, but around my buildings and stacks also. It is easily made, and the cut explains itself. I use a light cedar or spruce pole, sawed *nearly* through, for sides. S. T. T.

Suffolk Co., N. Y.



209.

[We have seen a ladder resembling this closely in shape, made as follows:—Split an ash or spruce pole to within a few feet of the end; then put a ring round it to prevent it from splitting further. Spread it the proper width for a ladder, bore holes and insert rounds the right distances apart, and the ladder is ready to be thrust up through any little opening and will rest firmly against a small branch where an ordinary ladder would cant or twist about.—EDS.]

An Improved Sap-spout.

IN the device, a sectional cut of which is here presented, the part marked A. is a little less than the hole bored in the tree, and C. is a little smaller than A., to admit of the sap flowing freely from the tree. At B. the spout fits the hole tightly. D. is a notch for the bucket to rest on. F. is another notch made to prevent the sap, as it falls from the opening, from running back along the spout. E. is a quarter-inch hole bored through the spout for the flow of the sap. Slip the bucket over the spout on to the notch D., and then it hangs against the side of the tree, nothing being in the way of the cover, which can be placed on the bucket shutting the sap in and thus preventing it from freezing as quickly as it would if exposed to the air, while the bits of bark or other objectionable matters are shut out. One can hold the pail to receive the sap in one hand, and with the other turn the bucket and pour the sap out. W. RANDALL.

Hygienic Information.

TRICHINOSIS.

THE recent interdiction by most European Governments of importations of American hog products on the ground that their consumption is especially liable to produce trichinosis, has attracted to this disease an amount of lively interest greatly disproportionate either to its frequency or fatality. Of the few deaths attributed to it there is excellent reason for believing that a large proportion are really due to other causes; but, even granting that all that are imputed to it are actually produced by it, yet the number every ordinary year is probably smaller than that of those from hydrophobia or by lightning. With regard to the fatality of the disease, the proportion of deaths to cases is no greater than in many diseases of common occurrence. For instance, in 1866 the malady was epidemic at Hederslaben in Germany, a town of 2,000 inhabitants, and out of 327 cases of trichinosis 82 only were fatal, or a trifle over two deaths in seven cases, and this is a fair average rate in severe attacks. In milder cases the proportion of deaths is much smaller, only three having occurred in 200 observed cases. Indeed, many people doubtless have suffered from mild attacks of the disease, who have attributed their pain to rheumatism or a severe cold. Even among the most skillful physicians there is yet a good deal of difference of opinion as to the nature of this disease, as shown by the disagreement among the doctors as to whether the two alleged cases of the malady lately discovered at Madrid were really instances of trichinosis, and there has been a like divergence of opinion regarding a couple of recent cases in Dublin.

Trichina Spiralis Greatly Magnified.

As far back as 1832 it was discovered that the muscular tissues of man sometimes present, after death, a sanded appearance due to the presence of innumerable minute cysts, or mouthless sacs, scattered throughout the substance. When examined under the microscope, these little cysts are found to contain immature worms coiled up round and round in the smallest possible compass. They are cylindrical and tapering in shape and when they have attained their largest size they are one-twenty-eighth of an inch long and one-six-hundredth of an inch thick. The name given them is trichinosis spiralis, from a Greek word meaning "hair," and a Latin word meaning "spiral," the term being indicative of their appearance when coiled up in the center of the cyst or sac. So minute are the parasites and so multitudinous that sometimes as many as seventy or eighty thousand of them are found in a cubic inch of muscular tissue. Subsequent microscopic investigation has shown that nearly all animals may be infected with trichinæ (the plural form of trichina); but that of all animals used as food by man the hog is most liable to be so infected. This is chiefly attributable to its omnivorous appetite, which leads it to swallow all sorts of refuse flesh, for trichinæ are propagated among all sound animals by feeding on trichinosed flesh.

The dangerous period in trichinosis is shortly after the introduction of the parasites into the system. When the muscular flesh of pork containing the encysted mites, is eaten in a raw or improperly cooked condition, the cysts are digested and destroyed, but the inclosed worms, retaining their vitality, pass into the small intestines. There they lose their spiral form and in four or five days attain maturity and a length of from one-ninth to one-seventh of an inch. The sexes are soon developed and each impregnated female produces from 1,000 to 2,000 live embryos, the parents dying after having produced young. The embryos, which are extremely minute but of the same form as their parents, at once begin to penetrate the walls of the intestines and to make their way throughout the whole body. This causes irritation of the intestines first and then pain in all the tissues they penetrate, so that their progress is made manifest by the symptoms of suffering in various parts of the body. Within a fortnight after the appearance of the first symptoms the parasites are dispersed along the voluntary muscles throughout the body and limbs. There they soon become inclosed in distinct sacs where they increase in size to one-twenty-eighth of an inch and become coiled spirally like their progenitors in the same stage of development. In their passage through the body they produce extreme pain, which is intensified as they absorb the substance of the muscular tissues during their growth. All the voluntary muscles are painfully affected, and are often unable to perform their customary functions; the limbs swell and are extremely tender; nausea, a high fever of a typhoid character and many other painful symptons appear, the attack generally ending fatally in about four weeks, and sometimes much earlier. If the patient survives this period, the encysted trichinæ usually become quiescent and remain without material alteration for an indefinite time, awaiting an opportunity for development in the alimentary channel of another animal, an opportunity most of them never obtain. The severity of the disease depends on the number of encysted trichinæ introduced into the system, and the fecundity of the females therein developed. In favorable cases convalescence is generally slow, and the muscles remain stiff and tender for a considerable period. There is no specific remedy for the ailment.

The only known preventive of trichinosis is the thorough cooking of trichinosed flesh before it is eaten. Some say that the application of heat enough to coagulate albumen—160 degrees—is sufficient to kill the parasites; but the latest, best and safest method is to cook the meat thoroughly throughout. If the pieces are large, trichinæ in the middle are not killed by heat that kills those on the outside. As long as any part of the meat retains the "pink" color known as "rare," it is highly probable that infesting parasites have not been killed. Smoking and pickling are of no use whatever. Trichinæ can be detected in the muscular tissues of pork or other flesh by aid of a good microscope with careful observation and a little practice.

Potash	.23
Soda	.42
Phosphoric acid	.38
Sulphuric acid	.37
Carbonic acid	7.05
Moisture	1.00
Combined water (of slaked lime)	13.46
	100.00

As to the state of combination we may say that probably the seven per cent. of carbonic acid is united to nine per cent. (in round numbers) of lime, making about 16 per cent. of carbonate of lime—that the combined water is united to about 42 per cent. of the lime, making 55 per cent. of hydrate of lime (slaked lime) and that the remainder of the lime—16 per cent.—exists as caustic lime. Accordingly the sample contains 87 per cent. of lime and its carbonate and hydrate. It contains also nine per cent. of sand, char., oxide of iron and moisture, leaving but four per cent. of magnesia, alkalies, phosphoric acid and sulphuric acid.

These "ashes" are, in fact, lime, so slightly admixed with wood ashes as not to differ essentially from oyster shell lime in composition or value whether commercial or agricultural. The presence of so much caustic and slaked lime renders this sample very unlike ashes in its action on the soil. The name is misleading and evidently we have a material which will scarcely pay the farmers of Connecticut to transport from the "factories in Canada."

The weight of the struck bushel is about 55 pounds, its commercial value is not far from that of an equal weight of slaked oyster shell or other cheap lime.

545. Quinnipiac Coarse Bone, Sampled Mar. 10, from material purchased of the Quinnipiac Co., Wallingford, by Julius W. Yale, of Meriden.

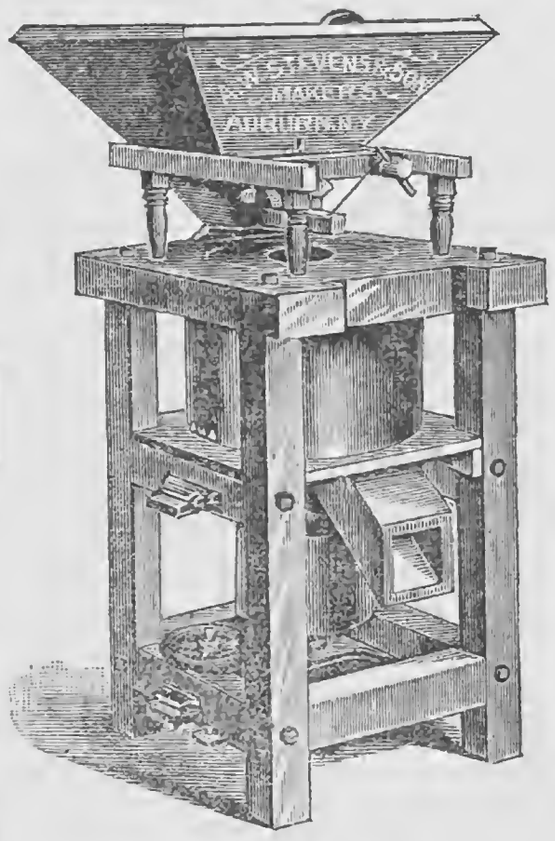
Industrial Implements.

The Stevens Improved French Buhr Feed Grinder.

A very excellent French Buhr Feed Grinder is made by A. W. Stevens & Sons, Auburn, N. Y. The advantages of grinding feed have



STEVENS FRENCH BUHR FEED GRINDER—FIG. 211.

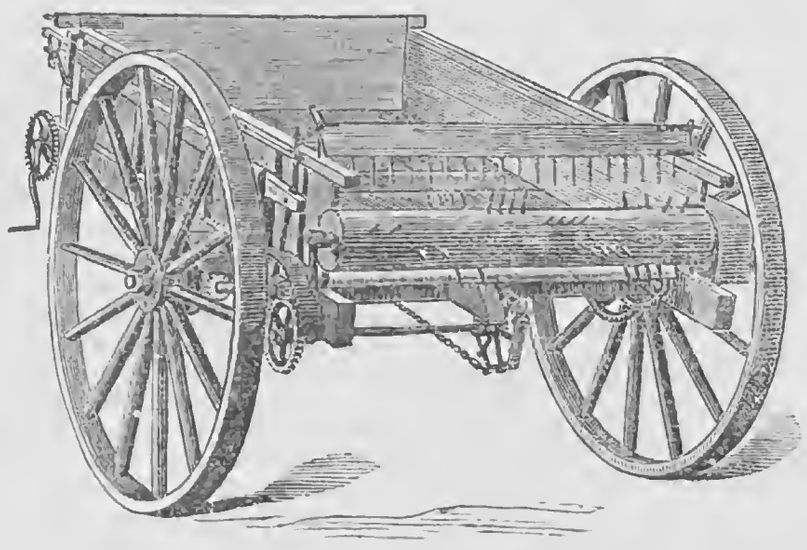
frequently been discussed in other parts of the RURAL, so that here reference need only be made to this, one of the very best mills for doing so. Many farmers and thrashermen have an engine or horse-power, which during a large part of the year lies idle, the owners losing the interest on the money invested in it. With a portable mill like this, these powers can be pleasantly and profitably employed during the season usually passed in idleness, the owners grinding not only their own feed but also that of their neighbors, and doing in fact a milling business. Indeed some who use them often grind, we are assured, from 150 to 200 bushels per day. The price of the mills has been fixed at a small advance on the actual cost, and full terms of sale will be promptly furnished on application to the above address.

G. B. B.

Kemp's Patent Manure Spreader.

As shown in the accompanying cut, this is simply a broad-tired machine cart with a short tongue, which connects with the front wheels of any farm wagon at the ring-bolt. It holds about 30 bushels, and having a movable bottom, like the traveling bed of a tread horse-power, when this is in gear it carries the load slowly to the rear, where a swiftly-revolving cylinder, armed with teeth and extending across the width of the cart, pricks the manure to pieces and scatters it evenly in fine particles as the team moves along. It spreads all kinds of manure, coarse or fine, as well as lime, ashes, marl, muck, cotton seed, etc., either wet or dry, in such quantities as may be desired per acre. This it does much more efficiently and in much less time than the work can be done by hand, so that far more benefit is derived by the crops from manure in this way well pulverized and evenly distributed than from an equal quantity applied in the ordinary unequal, lumpy fashion. This excellent device, which we have seen tested in a highly satisfactory manner, both experimentally at the last New York State Fair, and in ordinary work in the field, is made by the Kemp & Burpee M'f'g Co., Syracuse, N. Y.

G. B. B.



KEMP'S PATENT MANURE SPREADER—FIG. 212.

A HANDY AND EFFICIENT IMPLEMENT.—An excellent thing about a farm-house is an ordinary force pump; but still more desirable is one like the Lewis's Combination Force Pump, made to meet all the requirements of the country homestead. Besides washing windows and carriages, extinguishing fires, watering the lawn or the flower beds, and performing all the other duties of the common force pump, this unique contrivance can be promptly metamorphosed into a Paris-green or London-purple sprinkler, scattering sure death among the potato beetles, or it can be used to spray hellebore on currant bushes, or, in fact, to pour liquid death on noxious insects of all kinds on the farm or in the garden. Try it once, and you won't afterwards rest comfortable without one.

G. B. B.

Pomological.

THE CLARK APPLE AGAIN.

In the RURAL of Dec. 11, in which is given a fine illustration of the Clark Apple, my name appears in a manner seeming to call for a fuller history of this valuable fruit, the original tree of which still stands in our village. Seeds of fruit trees were brought from Plainfield, Conn., in the the year 1799, by Deacon Wm. Clark then migrating with his family here for settlement. A nursery was grown from these seeds, and this Clark Apple and one or two others of less value are the only seedlings worth preserving, although many old orchards of native fruit from this nursery are still standing in the neighborhood, owned by the lineal descendants of the first proprietors. La Plume is four miles from here, so there is no serious discrepancy of statements except as to time. The tree now standing is a sucker from the parent tree which fell many years since, and is at the corner of the barnyard of Dr. Hiram H. Nichols, whose wife, formerly Miss Clark, inherits the patrimonial estate on which it stands. The apple is well described by Mr. Downing in the above issue and is not extolled a whit too much.

S. S. STEVENSON.

Clark's Green, Pa.

Miscellaneous.

SUGGESTIONS FOR SPECIAL NUMBERS OF THE RURAL.

I trust the RURAL will not deem it an impertinence in me to say how much I like the "Special" features of the paper; how I enjoyed the Corn Number and the "Decorative" Number, or, as it was termed, the Plant and Shrub Number. I would suggest a "Garden Sass" Number and a "Root" Number—the "garden sauce" to comprehend such vegetables as would be desirable for the farmer to cultivate for home consumption, both in a fresh state and for Winter use. I should much like to see what vegetables the RURAL would recommend. It should also contain instructions for cultivation and for keeping, so as to be used at other times besides when fresh from the garden. Beyond a few heads of lettuce, a few radishes, a "mess" or two of peas, as many of beans in the Spring, and of potatoes, a few beets, onions and turnips, the ordinary farmer has mighty little to add to his fare of bread and meat—the latter in many cases salt at that. Perhaps the RURAL would suggest some vegetables as worth a trial.

In the "Root" Number we might get an idea of what roots to raise for stock to mix with dry fodder for improvement of stock—roots that could be easily raised and cared for, besides turnips, which are about the only crop raised by the average farmer. Of course, progressive farmers raise others. Or perhaps the RURAL might venture the opinion that roots will fall off in demand and use, now that we may *can* our fresh fodder in silos.

The "Garden Sass" Number might contribute to the health of the rural community by a greater variety of diet. Too many people live in an atmosphere in Winter of volatilized grease, volatilized by griddle greasing for pancakes and the frying of meats. It would thus contribute to health, contentment and longevity. The "Root" Number, by improving the stock feed, would contribute to the increase of farm profits and contentment with farm life.

G. H. R., M. D.

REMARKS.—We are obliged for all such suggestions. It should be borne in mind, however, that each issue of the RURAL treats of farm topics, and it is only the most valuable

farm crops that it is well to devote special numbers to.—EDS.

Minnesota Sorghum Sirup.

C. F. Miller, of Rice Co., Minn., writes us:—"I have taken the liberty to send you a small sample of the *pure* "Minnesota Amber-cane sirup" by express, so as to let you see what can be made by any of the ordinary men in our county, who are skillful and handle things aright. I see by my correspondence that a lively interest is being taken in your State (my native State,) in this new and valuable industry, which is already assuming mammoth proportions in the West.

The "goods," as you will see, are entirely free from that peculiar, "green vegetable" taste, which has been so objectionable to the market value of sorghum sirup heretofore. This kind of sirup can be made by the thousands of gallons by every farmer who has a small capital, say $500 to invest. It takes no elaborate machinery to make good merchantable goods, that will sell in any market in the world. The sugars are of a bright, beautiful, light-brown color, very lively, and they are capable of being refined into the white sugars of the best grade. C. F. MILLER.

REMARKS.—Thanks to Mr. Miller. The sirup is in taste soft and agreeable without any of the characteristic or half-acid taste of poor molasses. Its color is a clear, reddish amber.

RURAL BRIEFLETS.

SOME friend sends us the following slip cut from a contemporary:—

"THE LADY APPLE.—In the Review of January 13 I read an item from the RURAL NEW-YORKER to the effect that the Lady Apple sold in New York city during the holidays at $6 to $7 per bbl. I don't doubt the truth of this statement, for I have often read of them selling at nearly twice that sum. Are not such items, unless accompanied by an explanation, calculated to deceive the general reader? The Lady Apple, Pomme d' Api, is a small flat apple, too small for general use, the largest of them not larger around than a silver dollar. When ripe, they are beautiful in color, being a rich golden orange, with bright carmine red cheek. In quality they are first-class, but the labor of gathering and packing them for market is why they cost so much money. They are seldom bought except by rich people, and therefore not adapted for general purposes. One of the reasons for their selling so high is that they are great keepers. Their size is the great objection, as a man can gather six or eight times as many common-sized apples in a day as of Ladies." G. F. N.

What is there deceptive about such statements without an explanation? Whenever we mention the price of the Lady Apple, must we tell the whole story? The reason which G. F. N. gives why they are not adapted for general purposes, viz., that they are seldom bought except by the rich, is a queer reason. This fact, standing alone, should adapt them for general cultivation—at least while they sell for six dollars and more per barrel. . .

WE have received the following letter from a writer in Rosewood, Fla:—

"On the 4th of the present month a man by the name of Charles H. Hogan (at least he signed his name so) pretended to act as agent for quite a number of papers, and among the lot was the RURAL NEW-YORKER. I paid him $1 25 for a year's subscription for the same. I have waited a sufficient length of time, but no paper has yet come. I now think I have been humbugged. Please let me know whether you know anything of such a person. Is he all right, or have I been humbugged?"

We know nothing of Mr. Hogan. Whenever the RURAL NEW-YORKER is offered for less than $2 00, it should excite a suspicion that something is wrong. . . . . .

WE desire more than ever before to rid our columns of deceptive or humbug advertisements, and to render this department of our journal as trustworthy as any other. It is right that we should in all ways endeavor to assist trustworthy advertising patrons. Thus we help our readers, our advertising patrons and ourselves. But in order to do this the obligation is potent that we should expose fraudulent advertisements, and to this end we ask the co-operation of our readers. Their complaints are promised prompt and careful investigation. . . . . It *often* occurs that advertisements come to us with the appearance of entire reliability. We inquire of the agent through whom the advertisement comes and are assured that such is the case and that the firm is entirely respectable. The advertisement is inserted, and but for the complaints which reach us from our subscribers we should never know in many cases that the advertisements were not to be trusted. . . . . Here is a case to illustrate:—

"Elkhorn, Todd Co., Ky.—We noticed in one issue of the RURAL the advertisement of Chase & Co., of Westboro, Mass. Our little daughter answered the advertisement, and what she got has turned out a perfect humbug.

MRS. C. A. M."

Thus warned, the advertisement was at once thrown out, and others from the same party through the same agent were rejected. One of our young men ascertained by diligent inquiry that Chase & Co., of the Literary Guest, Westboro, Mass., and Wilds & Co., of the same place, and Tracy & Co., Vane & Co. and Professor Gargell & Co. are all conducted by one JONES, and that the Post Office Department has forbidden mail to be delivered to him. Had we made *searching* inquiry before the advertisement appeared, some or all of this information might have been gleaned before. But the advertisement itself was not objectionable upon its face, and we had confidence in the advertising agent; so that the motive for further inquiry was wanting. . . . . It is mortifying to us to be obliged to admit that in spite of all reasonable efforts to guard against it, disreputable advertisers have from time to time been permitted to avail themselves of the columns of the RURAL NEW-YORKER. . . . . Here is another:—

"Rising City, Neb., March 25, 1881.—Please say to the patrons of your paper that Chase & Co., of Westboro, Mass., are frauds. Some weeks ago I noticed their advertisement in the RURAL, offering the Literary Guest for three months and a prize of two oil paintings of large size, valued at $6 00, all for 35 cents. We sent the 35 cents as directed, and after several weeks received the paper (which is only an advertising sheet), with a circular stating they had just run out of the prizes, but if we would send them 50 cents more they would send two other pictures. The paper is a deception and the whole thing an advertising swindle. F. M."

. . . . . .

IT is time that our readers were thinking of their melon patches and of procuring the seeds of the best varieties. The melon is a fruit that rapidly deteriorates unless care is given to the purity of varieties and the selection of seeds from the best and earliest specimens. Among watermelons we see that "CUBAN QUEEN" is highly extolled by our contemporaries, as well as by the firm who introduces it, viz., W. Atlee Burpee & Co., of 219 and 221 Church Street, Philadelphia, Penn. This firm has kindly sent us packages of the seed for trial. It is described as a recent introduction from the West Indies, and is considered the *largest* and *choicest variety in the world*. The skin is said to be beautifully striped and the rind seldom over half an inch in thickness. The melons are said to vary from a round to a round-oval in shape. The flesh is of a bright scarlet, remarkably solid, crisp and sugary. Fifty dollars are offered in three prizes to those who grow the first, second and third largest specimens. We cannot speak of this melon from experience, since we have not tested it. The only doubt in our mind is whether the season in this climate will prove long enough for it. No matter how excellent a variety of watermelon may be, unless it ripens before the cold nights of early Fall it must prove worthless. We should like to have some of our readers compete for the prizes and to hear as to the value of the Cuban Queen. Let us suggest that the seed-bed be made in light, sandy soil, in a warm exposure, and that the hills be enriched with *rich*, light soil, rather than with manure, even though well rotted. One strong plant in a hill is enough—the hills six feet apart each way. . .

OUR many, many old friends will share with us a feeling of regret that our "Free Plant and Seed Distributions" are sometimes the cause of exceeding annoyance. We present below the letter of a new subscriber—an intelligent man seemingly—who presents his strictures in a style as ironically forcible as they are unjust—at least so it appears to us. We have numbered the essential parts of the letter so that the reader may readily connect them with our comments.

SALEM, Dent Co., Mo., March 28, '81.

On reading the article in last RURAL, 26 inst. "To Rural Subscribers" it came into my mind that the writer had taken a supper of mince pie and hard-boiled eggs or had been the recipient of a curtain lecture the previous night. Although it did not mention the writer hereof, he felt it all the same, for the seeds offered had something to with his subscribing, yet he would have subscribed anyhow. (1,) Now, whether it is your intention to give the seeds as a premium or not, it seems to me it is but a play on words; most, if not all, subscribers so take it, and I suppose you would not offer them did you not expect it to be an inducement to subscribe. And then (2), you don't allow anybody to thank you. Well I propose to say I am very exceedingly thankful—to Providence, that so many good things as the RURAL prints in the course of a year can be had for the insignificant sum charged and a what-will-you-call-it, thrown in. As to what is said about not valuing a certain kind of subscribers very highly, if I should express myself just as I felt I should say (3), it was none of your affair what induced them to subscribe. (4), Don't tell a man he is a fool for giving two dollars for an article that he could buy for one. Thankfully and Respectfully,

A NEW SUBSCRIBER, T.

(1). As we understand the word "premium" as used in this country in connection with journalism, it is a peculiar kind of pay offered for the services of agents and others as an inducement to procure subscribers. It is submitted that we have never offered seeds or plants for this purpose. Our first distribution of seeds was made in April five years ago; our next in September four years ago; our next in the March following. Three years ago we distributed 10,000 packets of Clawson Wheat raised at the Rural Farm gratuitously. We have thrice sent a small assortment of seeds to the members of our Youths' Horticultural Club which now numbers 1,000 names. We have twice sent out cuttings of the Salix pentandra. In some of the above cases we have made no charge even for postage; in *all* others less than we ourselves have paid.

Must such distributions be considered *premiums?* For the past three years our *main* Distribution has been announced during the latter part of the year, and for the past two years, these Distributions have been advertised in connection with the Rural's Experiment Grounds as a *means of inducing subscriptions* and increasing our means of not only continuing them but of rendering them more valuable from year to year. Are they *premiums* therefore? (2). Yes, we "allow" our friends to thank us and are grateful to them. But we do not think that we are entitled to thanks. The obligation is mutual, as we have said, or, if not, the balance of indebtedness is due from us to our subscribers whose support enables us to continue our distributions. (3). We have never said that it *was*. We have said that we did not value subscribers who view our distributions of seeds and plants *merely* as a method of gaining subscribers and who have no appreciation of the motives which influence the management of the RURAL NEW-YORKER. If these distributions are to any great extent the means of securing new subscribers, we have to reply, first, that we have never been made aware of the fact, and second, that it is the *costliest* method of advertising that publishers ever adopted. We have no doubt whatever that in a *given* season the money which our "Distributions" cost, if judiciously invested in advertising, would be far more effectual in securing subscribers. In the long run, however, we do entertain hopes that the real value of the plants and seeds which we have introduced and may introduce will promote the aims of this journal as mere advertising never could. (4). This remark we may not comprehend. Does the writer mean that we must not call him a fool for giving two dollars for the RURAL NEW-YORKER which is worth but one? Or does he mean to imply that he pays two dollars for the seed, etc., which are worth but one dollar or perhaps less? We can only reply that all seedsmen charge 25 cents or more per packet for new and valuable kinds. Oftentimes the enterprising seedsman desiring to be foremost in the introduction of novelties, offers them with no other knowledge of their worth than the commendations of the originators For the most part, however, in the many distributions we have made, we have ascertained their value *before* offering them to our subscribers. Scores of "new" things have been tried at the Rural Grounds and rejected where one has been preserved. That we have been successful in introducing or disseminating new seeds or plants of high value, the Cuthbert Raspberry, Beauty of Hebron Potato, Blount's White Prolific Corn, Clawson Wheat, the Acme Tomato, Golden Mangels, Ennobled Oats, etc., etc., not to mention any flower or hardy shrub or tree seeds included, will sufficiently attest—and we entertain a lively faith that the present Distribution may add to the list strangers that come to stay.

Finally let us repeat. *If any of our subscribers, for any reason whatever, are dissatisfied with the* RURAL NEW-YORKER, *we agree, upon being so advised, promptly to refund the money for the unexpired term.*

What Others Say

A MEMBER of the Western N. Y. Farmers' Club, as reported in the Am. Rural Home, used to think that a man who would dilute milk was a villain. He tried to establish a route for pure milk, advertising quite extensively. But he found it up-hill business. He found but very few who were willing to pay more for pure milk. Citizens seemed generally satisfied with watered milk. He ran the business about three years, losing money all the time, jeered at by other milk-men, and then he took to wholesaling his milk. In fact, the price of milk has been reduced so low by watering, that an honest milk-man cannot live.

APPLES AND PEARS.—M. Carrière gives in a recent number of the Revue Horticole figures of an apple which produces on the same tree and even from the same spur, fruits, some of which have the true depressed-globose form of the apple, while others are pear-shaped. The tree grows near Rouen, and was inspected by M. Carrière himself. It is stated that it was only in shape that the fruits varied, the taste and perfume being in all cases those of the apple.

HERE is an important bit of experience which Mr. Bennett gives to the N. Y. Hort. Society:

About three months ago Mr. Bennett became fully convinced that smoking or fumigating destroyed the color of high-colored rosebuds. Instead of fumigating, about December 12th he began using cut tobacco stems as a mulch, and since then had rarely seen a green fly until recently. About seven weeks after mulching, the fly began to appear and the plants were soon covered. Used the mulch again, and now the plants are perfectly clean, the fly actually having died from the fumes of the mulch. It not only is a preventive, but a cure.

John Henderson asked if there was any economy in using the mulch. Mr. Bennett answered he thought there was in labor. Two boys could cut up enough tobacco in a day for a house 100 feet long. He used a hay-cutter.

Mr. Henderson: "Does take more tobacco?"

Mr. Bennett: "It might take more tobacco, but refuse tobacco stems are plentiful and readily obtained."

John Eagan said there was no doubt but that fumigating bleached the buds of roses.

Peter Henderson stated his experience in using tobacco to destroy thrip on dracænas. He made a decoction like strong tea, or rather strong coffee, and dipped his plants therein; found it very efficacious.

Mr. Bennett said he forgot to mention that tobacco stems used as a mulch acted also as a fertilizer. Since using it, he had noticed a great improvement in the foliage of his roses.

MR. JENNER, as we see in the Rural Home, planted potatoes in coal ashes two feet thick, and they yielded fair-sized tubers of good quality. There were no wood ashes among them, as they were taken from a stove that had burned all Winter without re-kindling.

ADULTERATION, one would imagine, had in this country reached the limits of its evil perfection, says the Agricultural Gazette, (Eng). But it is evident, from a report just published by the Illinois Humane Society, that in this branch of knavery we are far behind our unscrupulous kinsfolk over the sea. In Chicago they have lately started into the business of adulterating neat cattle by weighting them with water. This is accomplished by the stockman in charge of a car-load of steers mixing salt plentifully with the provender given the animals at the last feeding station before reaching Chicago. This, of course, excites unquenchable thirst. Upon landing the brutes at the stockyard, they are given all the water they can drink, until—so it is affirmed, though the statement may excite the scepticism of an anatomist—they "have been known to burst open from a plethora of liquid in the stomach." The cattle are then sold, when, it is needless to say, the butcher has to pay for the water at the price of beef."

VITALITY OF CIONS.—Mr. Wier tells the Prairie Farmer that he had kept cions of the pear in sawdust from early Winter through the whole of the following year, and to the next June, fresh and in good condition, and when inserted as grafts they grew, and trees are now bearing from them. Mr. Wier quotes the remark of Van Mons that grafts received by him after being three years in the mails had been inserted and grew.

OH! the unwritten and unwritable code of the successful farmer.—London Ag. Gazette. . . . . The Western Rural says that Dr. Loring is too much of a politician to make a good Commissioner of Agriculture.

BOOKS, CATALOGUES, ETC.

KISSENA NURSERIES, FLUSHING, N. Y. PARSONS & SONS COMPANY.—Descriptive catalogue of ornamental trees and shrubs. We take pleasure in calling the attention of our readers to this catalogue which is, all at once, comprehensive, simple, accurate in names and possessed of a carefully prepared index. This firm through a number of years, has given studious attention to novelties. All of any promise, both abroad and at home, have been purchased and tested, the inferior rejected, the good propagated for sale. Among these we are greatly pleased to see offered for the first time the "Sunray Pine," which, to our thinking, is the handsomest evergreen in cultivation. The plants offered are no doubt small and the price high. But the golden beauty of this plant would tempt one to purchase it in spite of size or price. Our own specimen, now about four years old from the nursery, is about two feet high. It has not been harmed by the Winter, so that it may be estimated as hardy enough to stand 16 deg. below zero, at least. Besides a long list of novelties, all of the old kinds are briefly described and both the familiar and botanical names given. Lists of roses, azaleas, rhododendrons, &c., are also presented.

WE have received the catalogue of E. Y. Teas, of Indiana, respecting which we desire to make a comment or so. Upon the last page is a re

production of our cut of the White Elephant Potato published in our Fair Number of last Fall. No credit is given for this cut. He says that he has grown it "the past season and believes it to be equal to what is claimed for it." Where did Mr. Teas get his seed from? Either from the introducers or the originator. The former sold no seed "last season." The originator sold the entire stock to the introducers. A specimen or so was sent to supposed trustworthy parties with the request that they would try it and report. Has Mr. Teas's stock of potatoes, eyes of which he offers for sale, come from such specimens? If so, his stock must be very small, and it can scarcely be deemed quite honorable that he should, under the circumstances, offer them for sale at all.

PROCEEDINGS of the American Poultry Association at their eighth annual meeting, held at Cleveland, Ohio, Jan. 31 and Feb. 1, 1881. Geo. S. Josselyn, Fredonia, N. Y., Secretary.

HOVEY & Co., 16 South Market Street, Boston, Mass. Illustrated Seed Catalogue for 1881. A long list of novelties. Among peas we notice the Telephone, sent out by the RURAL NEW-YORKER to subscribers two years ago. We have received many reports from our friends to the effect that the Telephone is a valuable variety. Also Hovey's Illustrated Catalogue of new or rare plants for 1881. Both will be sent without charge to applicants.

ILLUSTRATED PRICE LIST of harrows, cultivators, horse-hoes, road-scrapers, garden and field rollers manufactured by the Higganum M'f'g Corporation, Higganum, Conn. Sent free to applicants.

F. R. PIERSON, Tarrytown, N. Y. Illustrated catalogue of garden supplies of all kinds for country homes—seeds, plants, fruits, etc. Free.

W. V. SKED & Co., 1,451 St. Clair Street, Cleveland, Ohio. Catalogue of green-house and bedding plants.

GEORGE S. JOSSELYN, Fredonia, N. Y. Descriptive catalogue and price list of high-class poultry. Free.

Everywhere.

RURAL SPECIAL REPORTS.

ILL., Hagarstown, Fayette Co., March 30.—We are having very bad weather here for wheat. It froze very hard last night and snowed some this morning. Wheat is very badly hurt in spots and some pieces will have to be plowed up. We shall not have half a crop unless I am very much mistaken. No plowing has been done here yet. The season is a month behind ordinary years. Raspberries and peaches froze to death. There is very little old wheat in this part of the country, and what little there is doesn't bring enough to pay the farmers for raising it. When wheat does not sell for $1 per bushel the farmer doesn't get pay for his labor. J. H. B.

IND., Lagrange, Lagrange Co., March 28.—The Winter has been long and cold with plenty of snow, which made business lively in the lumbering line. Wheat looks quite well, though small. The quantity sown is equal to that in any past season. Stock has wintered well. Feed is plenty yet. There is very little disease among stock. We shall soon have a cheese factory in our place. This a good fruit country; apples, peaches, plums, etc., and all the small fruits do well. Our farmers greatly pride themselves on having the best of fruits. N. S.

IOWA, Masonville, Delaware Co., March 27.—I notice that there is much snow all over the world where snow has ever been in man's time and in many places where snow was never seen before, and we have not been forgotten. We had plenty of snow already, and yet to-day we are having another fall. I suppose we shall have Spring some time, so that farmers can go to work as usual putting in crops. Many have corn yet in the field not picked. Hay is plentiful enough yet to last until June. Prices here are:—hay, $3@7 per ton; corn, 23@25c.; oats, 25c.; potatoes, 50@75c.; Timothy seed, $2.75; live hogs, $4.50@5; beef cattle, $3@$3.50. Last season there was considerable Amber-cane raised. I anticipate more will be planted this year, as sorghum sirup is getting more in use here. No sugar has been made; but no doubt some will be made another year. I look for the time to come, and within a few years, when we in Iowa will make all our own sugar—a large item in our expenses, the home supply of which will save many thousand dollars yearly to our county alone. N. C.

IOWA, Carroll, Carroll Co., March 24.—This has been a long, tedious Winter in this State. The earlier part of the season was remarkable for extremely cold weather. February and March have been notable for tremendous driving snow storms. Farmers in the West depend largely on their corn-stalks in wintering cattle. The great depth of snow has shortened this source of supply. It will be a lesson to many farmers in this county. There will be fewer straw-stacks burned next Fall than usual. I do not think small fruit has suffered, as it has been buried under snow drifts most of the Winter. Not one farmer in ten has finished husking corn, and the snow is two and a half feet deep in the fields. We had no prospect of Spring until within the last two days. It is thawing now, but it will be many days before we can sow wheat. G. S.

IOWA, Kosauqua, Van Buren Co., March 29.—Yesterday we had another snow storm—one of the heaviest of the season. It is putting the farmers back with their Spring work. W. C. W.

KAN., Larned, Pawnee Co., March 28.—We are having a genuine March squall to-day. Wheat is pretty badly damaged. S. L. D.

LA., Clinton, Feliciana Parish, March 28.—Our corn is up. Cotton planting will commence next week. Peaches are now about the size of buckshot. Apples and pears are in bloom. Potatoes are up and booming; peas already stuck. Corn is worth 85c.; pork, $18; horses and mules, $100@130 Strawberries are in bloom, and raspberries just putting out. No land surpasses this for health, climate, water and varied crops. Our necessity is population. Land can be now bought for $2 to $5 per acre, much of which will bring a bale of cotton, worth $40. per acre. Why immigration does not come to Eastern Louisiana we cannot tell. There is not a veterinary surgeon within 50 miles of this place. W. E. K.

MICHIGAN, Bear Lake, Manistee County, March 26.—Everybody about here is interested in the great discovery that has recently been made. Salt springs were found on the Manistee River at an early day, and for several years a good deal of anxiety has been expressed to know what was under the county. Nearly or quite two years ago Mr. Chas. Reitz commenced boring for salt, although geologists declared no salt would be found in this region. Unswerving perseverance, however, has at last been richly rewarded; for salt, pure salt, has at last been reached; not brine alone, but a solid bed at a depth of 1,930 feet. Thirty feet of salt had been bored through when a solid substance was struck. The water spouts out of the top and runs off into the lake; the stream is large enough to fill a two-inch tube and is, of course, as strong as water can be made, containing 36 per cent. of salt to 100 parts of water. It is a great success, and several mill-owners are making preparations to put down wells immediately. Dr. Garrignes, State salt inspector, after testing a sample, gave his opinion that Mr. Reitz has struck the rock salt deposit, his being the first well that has reached the primary salt field in Michigan. He also says that bicarbonate of soda, sal soda, and soda ash are all made of salt. Four million dollars' worth of these are yearly imported into the United States. Is there not a chance here for men to make fortunes? These new industries will lift Manistee out of the backwoods in a very short time. Already this new discovery has affected the value of real estate, and there is no doubt but there will be a greater addition to the population this Spring by immigration than for several years past. Besides the manufactures that give employment to so many hands, there will be a fine chance for enriching the farms with agricultural salt, that is usually sold for a very low price at the salt fields. The future of Manistee is sure to bring wealth to its industrious, enterprising inhabitants. There are but few if any of the northern counties of Michigan that have a brighter prospect. In the first place, it is one of the healthiest locations in the world. Secondly, it has an extensive lumber business, which is likely to last for many years. Miles of lumber are made every day in the sawing season; and it is said more shingles are manufactured here yearly than in any other county in the Union. Thirdly, it is a fine fruit-growing region, and the farming lands are constantly improving; and now to "top off with," we have the very best salt bed yet discovered in Michigan, if not the very best on the Continent. Whoever is desirous of obtaining many of the good things of this life, especially good health and good salt, should come to Manistee County. Apples, per bbl., $1.50 to $2 25; butter, 15 to 25 cents per pound; eggs, 25 cents a dozen; lard, 11 cents per lb.; potatoes, 55c. M. E. A.

NEB., Rising City, Butler Co., March 28.—We have Spring at last. We have had abundance of snow and cold, bad storms. Stock has suffered for want of shelter and food, there being nothing left but straw, and not much of that. Our snow is gone and farmers are just beginning to sow wheat. We anticipate good crops this year. Immigration has already commenced; we look for better times. F. W.

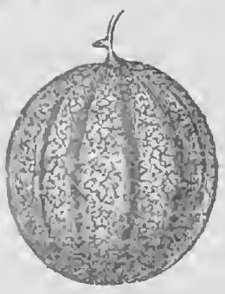
OHIO, Dent, Hamilton Co., March 28.—We have passed through a long and very severe Winter, and it continues cold. Peaches are all killed and early cherries and other fruits are badly damaged. Clover is one-half or two-thirds frozen out, and wheat looks as if it were pretty nearly gone; time has to determine what the future crop will be. A. T. P.

Trees, Seeds, Plants, &c.

82-POUND CUBAN QUEEN WATER-MELON.

This new Melon from the West Indies is certainly the **Largest** and **Finest Variety** in the world. All who saw our crop the past season remarked they never before saw such a large, fine Melon, nor any so **wonderfully productive.** Their flesh is bright red, remarkably *Solid, Peculiarly Luscious, Crisp, and Sugary*—surpassing all others. On a Melon of enormous size there is barely half an inch of rind! They are very hardy, strong and vigorous in growth. *Price 25 Cts. per Packet of 15 seeds;* 6 Packets for $1.00, post-paid. We offer **$50.00 IN CASH PRIZES**, to be awarded as follows:—$25.00 to the grower of the Largest Cuban Queen Water-Melon; $15.00 to the grower of the second largest, and $10.00 to the grower of the third largest. Do not fail to try and see how large the **Cuban Queen** can be grown.

☞ **OTHER SPECIALTIES FOR 1881.—Burpee's Netted Gem Musk-Melon** (see illustration), the most productive and most delicious small Early Citron. Price, 25 Cts. per packet. **Montreal Green Nutmeg,** the largest Musk-Melon known, weight 22 lbs., and of superb flavor. Packet, 25 Cts.



Burpee's Climax Tomato, far ahead of Acme, and the best of all tomatoes. Price, 25 Cts. per packet. **Burpee's Surehead Cabbage,** always heads. 15 Cts. per packet. **American Wonder Peas,** genuine, 15 Cts. per packet; 60 Cts. per pint, post-paid.

A New Morning-Glory—The Eclipse, from Brazil, surpassingly beautiful. 20 Cts. per packet.

A Liberal Offer only to those who order from this advertisement. **For Our Dollar** we will send, by mail, post-paid, to any address, one packet of each of the above, amounting in value to $1.50, and will **also** give two trial packets of **New Early Cabbages** and a sample of the **New Golden Grains Wheat. Order now!** *Postage-stamps accepted as cash.*

Burpee's Farm Annual for 1881, beautifully illustrated, mailed free to all who write for it.

Address W. ATLEE BURPEE & CO., Seed Warehouse.
Nos. 219 and 221 Church Street, Philadelphia, Pa.

E. P. ROE Supplies Country Homes with choice first-class Small Fruit, plants and Grape Vines, and makes some singularly liberal offers of plants with the superbly illustrated book "Success with Small Fruits." Descriptive Catalogue free. Address E. P. ROE, Cornwall-on-Hudson, N. Y.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, APRIL 16, 1881.

The best advice we can give our readers for the season is to *prepare* the land for crops better than ever before. It will pay you, good friends, to do so. Try it. Use less manure if you will; but harrow the plowed ground until it is smooth, and mellow.

It is very generally taken for granted that salt is an excellent if not a needed fertilizer for quince trees, asparagus plants, etc. Many tell us how much they have applied "without doing any harm." Did it do any good? Who can tell from actual experiment?

In reply to continued inquiries we would say that we advise none of our readers living north of Iowa City, Chicago, Toledo or New York to plant Chester Co., Mammoth Corn. Last year was an especially favorable one for corn and this variety needed all of it to ripen fully.

The first announcement that Ricketts's "Secretary" Grape was a failure as tested at the Rural Grounds, was made in these columns two years ago. The second announcement that we have seen comes from Mr. W. C. Barry, who says:—"It has turned out to be a great failure. The fruit is small, of medium quality, not so good as Clinton. The vine is a miserable grower and the foliage poor."

We have tried the effects of commercial fertilizers of liquid manure, of old stable and barn-yard manure on various crops with which we desired to excel. But the very best results have been obtained from a mixture of thoroughly decomposed leaves, stable manure and muck—that is, so decomposed as to form a *soil* of these substances. If any of our readers wish to grow prize vegetables of any kind, let them try it.

Melons and Cucumbers.—For early melons or cucumbers many plant the seeds on inverted sods cut about four inches square. The sods are placed in a frame of any kind and covered to the depth of half an inch with mellow, rich earth. The plants root firmly in these sods the same as they would in small flower-pots and may safely be transplanted as soon as the weather becomes settled and warm. For melons this is an excellent plan, since our seasons are scarcely long enough to ripen them before the cool nights of Autumn, when the seeds are planted in the ground in the usual way. Late melons are never sweet.

Not an American Among Them.—The shipments of grain from this port last month amounted to 6,645,712 bushels, including 4,043,343 bushels of wheat; 2,514,036 bushels of corn and 88,336 bushels of rye. To transport this vast bulk the services, in whole or part, of one hundred and seventy-three vessels were needed—ninety-two steamers, twelve ships, sixty-eight barks and one brig. Of these, one hundred and four were British; nineteen, Norwegian; seventeen, Italian; eight, Austrian; six, German; six, Belgian; four, Swedish; four, French; two, Danish; two, Dutch; one Portugese, but there wasn't an American among them!

Is it Thrift or Parsimony?—The establishment of an Experiment Station in connection with the agricultural college at Amherst, is strongly advocated by the farmers of Massachusetts. That objections should be made in the Old Bay State to the trifling cost of so obviously beneficial an institution is, indeed, a matter of surprise. That the favorite abode of intelligence, enterprise and culture should be ignorant of, or insensible to, the advantages its struggling agriculture must derive from such a station, cannot for a moment be suspected in view of the fact that States with much more modest pretentions to these virtues are wide-awake to the benefits derivable from such institutions. That Massachusetts is also the favorite abode of thrift on this side of the Atlantic, may account for her hesitation in making a liberal appropriation for the station; but her intelligence must surely soon apprehend that such thrift is of the penny-wise-and-pound-foolish sort.

Cheap Homestead Adornment.—Farmers, strive to make your homes *homelike*. We do not ask you to spend money beyond your means for shrubs and trees, flowers and vegetables. But do what you can while not permitting the more pressing interests of the farm to suffer. Plant a few trees and shrubs, even though they be taken from the woods or fields. Plant grape-vines even though you go to a neighbor for cuttings. Sow the seeds of apples and pears for stocks upon which to graft the finest kinds that are cultivated about you. Plant currant and gooseberry cuttings, if you cannot procure the plants. Try a few rows of celery—a plot of asparagus. All this and more may be done by any farmer who *desires* to make his home *homelike;* to attach his children to it. He will at the same time be setting a good example to indifferent farmers and in the end he will find that he has materially added to the sum of his happiness.

The Season.—All over the North and over a good deal of the South, too, the season is still backward, ranging behind the average for a decade of years from seven to 14 days in States bordering on the Ohio to fully a month in Northern Minnesota. At the end of last week the Signal Service reported the temperature over the Northwestern States at about freezing point except in Minnesota where it still averaged below zero. Even there, however, it is expected that the ground will be fit for seeding to begin by April 20, though in the Red River Valley it will be later, while in Dakota it is expected to begin about the 10th. In Iowa and Wisconsin the prospect is that it will be as late as the 16th, and that owing to the tardiness of the season and the curtailment of Fall plowing by the early advent of wintery weather, there will be a diminished acreage of small grains. In Illinois, Michigan, Indiana and Ohio reports with regard to Winter wheat are variable, although the majority are favorable for a good crop. Missouri and Kansas are still rejoicing over their prospects of an unusually fine harvest. Last Spring seed sown after April 17 throughout the Northwest, made a much better crop than that sown a month earlier, and various published records for a series of years go to show that late-sown wheat has done the best. This fact together with the consideration that Winter can't last all Summer or even all Spring, must afford some solace even in the bleakest quarters.

Opposition to the introduction of American live stock and cereal products is rapidly growing among the agricultural classes in every European country. In Germany the chief agricultural societies have been earnestly beseeching Bismarck to protect home industry by laying a strongly protective if not a prohibitive import duty on grain and "provisions" from this country. The Great Chancellor, finding their prayer in accordance with his own predetermined policy, has graciously already imposed a considerable tax on imports of our products and may yield to the farmers' late entreaty to increase it. In France similar petitions have been addressed by the farmers to the Government, and last Tuesday the Secretary of Agriculture promised that in order to leave the Ministry complete liberty to tax imported cereals and cattle, these should not be included in commercial treaties. In the United Kingdom farmers and their special organs in the press are constantly on the outlook for some plausible pretext for insisting on restrictions on importations of agricultural products. Despite the hardships brought upon them by successive bad harvests and close competition with cheaper foreign meats and breadstuffs, the agriculturists of the country have hitherto been restrained from boldly advocating the imposition of protective duties on these products by the consciousness that a protective policy could not be consistently adopted in their favor by the foremost, or, rather, the only advocate of free trade, among the nations. Should another bad harvest, however, aggravate their distress, it would cause us little surprise to find the British farmer giving loud expression to his present taciturn belief in the right and expediency of a protective tariff, at least on goods that compete with his own.

ABOUT THE FREE SEED DISTRIBUTION.

As the Free Plant and Seed Distributions of the Rural New-Yorker are not offered *as* premiums but mainly for the purpose of introducing, without cost to our patrons, new plants which promise to prove of more value than those in general cultivation, the question may have arisen in their minds, why we do not bear the *entire* cost of postage as well as of the seeds and the expenses attached to putting them up. We have this answer to make. A considerable proportion of our readers are not so situated as to be able to give the seeds a trial. Many others read the Rural for the information derived from special departments, such as the poultry, swineherd, herdsman, querist, implement departments, etc. The seeds and plants are of little value to such readers. If, therefore, we sent our Distributions to all of our subscribers, whether they applied or not, we should put ourselves to the great and useless expense of sending them to thousands who do not care for them. The reputation which the Rural has established of testing all novelties, naturally induces persons who have novelties of high promise to introduce to send them to us for trial. In this way as in many others, our Distributions, the R. N-Y. itself, and our Experiment Grounds work admirably together. If the seeds, fruits or plants of whatever description prove inferior to old kinds, we are enabled to state the fact to our readers and thus save them the expense and disappointment of ascertaining it for themselves. If, on the other hand, they prove superior to old kinds, we at once set to work to secure a crop large enough to enable us to distribute them among our readers.

Attended as they necessarily are with a deal of vexation, we are, nevertheless, so well satisfied that the work is good and that we are pleasing our friends and serving the interests of agriculture and horticulture, that we shall apply ourselves to our *next* Distribution in the hopes that it may utterly eclipse any of its predecessors.

We are now well through with the present seed distribution except as to those who are still applying from day to day. We may now the more fully devote ourselves to our crowded columns and endeavor to show to our kind friends that we are deeply grateful to them for the prosperity which the Rural New-Yorker enjoys to-day.

THREE DISASTROUS FLOODS.

Floods are just now devastating vast tracts of country, terror before and death, ruin and desolation behind them. In Hungary the river Theiss, which destroyed most of Szegeden last year, is again threatening the rebuilt city with a like fate, having, owing to the bursting of a dam, flooded over 150,000 acres of the adjoining country and risen even higher than in '80. Many deaths are reported and four batallions of the army have been sent to combat this terrible foe. Nearly all the low lands of Southern Spain have been submerged by late storms and enormous destruction of cattle, crops and even human beings has saddened the land. Worst of all the floods there, is that in Andalusia where the Gaudalquiver has engulphed a vast area of thickly-settled country and driven the terrified inhabitants of Seville to the highest stories of their houses for safety. Several detachments of engineers and sailors from the fleet, as well as the king and high officials have carried encouragement and relief to the afflicted region. Mightiest of the floods, however, is that which the muddy Missouri has been pouring over its broad bottom lands, and which has already swept from Fort Benton nearly to Kansas City—more than 2,000 miles. Early in the Winter an enormous quantity of snow fell in Montana; and for the last five or six weeks, the weather there has been extremely warm—almost summer-like.

The rapidly melting snows have swollen the upper Missouri as well as the Milk River, Yellowstone and its multitudinous other tributaries to an extraordinary hight, and the aggregate waters have swept down with a mass of accumulated ice upon the frozen lower part of the river at and below Yankton, creating huge ice gorges that in several cases have diverted the river from its regular course for miles at a stretch. The broad valley between Yankton and Sioux City is the oldest settled part of Dakota, and here the lately prosperous farmers have, in most cases, been entirely ruined by the flood.

All the towns on the River from Bismarck to Council Bluffs have suffered severely, but along the bottom lands the loss and suffering must be far more appalling. In Europe the flooded country is so thickly-settled that help is always at hand, and the inhabitants have only water to encounter; but along the Missouri the homesteads are often so far apart or so hidden in "clearings" among timber, that neighborly aid is impossible, while huge masses of ice, drift-wood and wrack add to the horror and danger of the rushing waters.

EUROPE'S WAR ON THE AMERICAN HOG.

During the year ending June 30, 1880, our exports of hog products amounted to $84,838 242. This vast trade has lately been seriously threatened by the action of seven European Governments in forbidding importations of American pork through alleged fear of trichinosis. With six of these our trade was so small that its discontinuance can have little effect on our aggregate exports; but last year France took upwards of $17,000,000 worth of pork and ham, and the loss of the growing trade with that country, if permanent, would be a serious injury. In England some interested parties in and out of Parliament endeavored to induce the Government to imitate the unfriendly action the Continental powers, but they have met with a prompt rebuff, so that our annual exports of 700,000,000 lbs. of hog products to the United Kingdom are in no danger of being diminished by hostile legislation.

Both individually and collectively Americans eat more pork than the inhabitants of any other nation, and nearly every pound that is eaten here is home-raised, yet the deaths from trichinosis throughout the country in the course of the year are probably fewer than those from lightning. The few deaths that are known to have occurred from the disease in a series of years, have in nearly all cases been among Germans, Norwegians or Swedes, and have been due to the imported custom of eating raw ham and sausage or imperfectly cooked pork. Owing to the prevalence of this habit in Germany, Norway and Sweden the disease there is much more common than here, nor is it owing to the use of imported American pork, for the native hogs are pretty badly infested with trichinæ according to the published statement of a German professor who found the following results of microscopic inspection in various cities. In Brunswick trichinæ were found in one hog in 5,000; in Halle the proportion was one in 1,500; Gotha, one in 1,800; Schwerin, one in 550; Copenhagen, one in 465; Stockholm, one in 266; in Kiel, Prussia, one in 260, and in Lienkeping, Swenden, one in 63.

In veiw, then, of the fact that trichinosis is almost unknown both in this country, where in proportion to the population more pork is eaten than in any other nation, and in the United Kingdom where vastly more American pork is used than in the whole of Continental Europe, there seems no valid reason why the use of American hog products should be considered especially productive of trichinosis.

BREVITIES.

Sir Edward Thornton calls Trichina spiralis an insect, which is a mistake, it being no more an insect than is the tape-worm or any other entozoon.

Several years ago we spoke of the value of Red Top Grass seed for lawns—Red Top alone. One of the finest lawns we have ever seen was sown with this only. Three bushels of seeds to the acre for lawns are not too much.

Mr. W. C. Barry calls attention to the Melon Apple as having no superior as a dessert apple, if, indeed, it has any equal. Though the fruit is so tender that it will not bear handling or long carriage and though the tree is not vigorous enough to render it a profitable kind for orchard culture, yet it is so desirable a fruit for family use that it ought to be included in every collection.

The present excitement about trichinosis is sure to be productive of fresh discoveries, not only in relation to that disease, but also with regard to internal animal parasites in general. Already microscopic research, by post-mortem examination, has found that an organism closely resembling *Trichina spiralis*, yet fundamentally distinct from it, is generated in muscular and visceral tissues of defunct animals at a temperature of 85° to 90° Fah. in the course of from 24 to 48 hours, and earlier if the animal was suffering from fever before death, or if the air is moist as well as hot. This mite is called the "death vibrio," and is about the same size as the trichina, from which an expert only can distinguish it, chiefly by the circumstance that it has never been found encysted, while the trichina is generally met with in that condition. No doubt one has often been mistaken for the other. It is supposed to be a nearly universal phenomenon of animal decomposition, and to be often generated in hams, sausages and preserved meats in which post-mortem changes have not been completely arrested. A good deal of gastric disorders and septic fever is attributed to it, the symptoms of diseases caused by it and by trichina being very similar and the ratio of deaths about the same.

The Querist.

ANSWERS TO CORRESPONDENTS.

Live stock and Grass Queries.

A New Beginner, Dalton, Pa., asks, 1, a remedy for catarrh in sheep; 2, what is the best sheep for mutton and wool in Northwestern Pa.; 3, where can Short-horn and Jersey bull calves, and Cotswold sheep be bought; 4, would the Improved Kentucky sheep be profitable there; 5, which is the best breed of cattle to fatten for the butcher; 6, what is a good mixture of grass for the lawn.

ANS.—1, We suppose the catarrh is only a cold, which sheep are apt to take when exposed to high, raw wind, snow, sleet, and rain, or standing on muddy ground. Secure the sheep from all such, give them of Epsom salts or sulphur just enough to loosen their bowels slightly, and with their hay feed night and morning one to two quarts of wheat bran, or twice the quantity of roots, instead of grain. A half to one pint of oil meal (linseed meal is the same), is a good thing also to be fed with the above. 2, The best sheep for a combination of wool and mutton, are the English Downs. If the pasture is rather scant and the ground rough, the South Down is preferable. If the pastures are abundant, then the larger-sized Downs, like the Oxford, Hampshire, or Shropshire. But a cross of the Cotswold, or any large long-wooled ram on Merino ewes or their grades, produces excellent mutton lambs and wethers, and a fair quality of wool. 3, Short horn bulls, F. C. Cornell, Ithaca, N. Y.; Jersey bull calves, M Miles, Mountainville, N. Y.; Cotswold sheep, Joseph Harris, Moreton Farm, Rochester, N. Y. 4, We have heard these sheep highly spoken of; but whether they would prove the best kind for any particular locality, can only be ascertained by trial. 5, If pasture is abundant Short-horn cattle are the most profitable breed to rear for the butcher; but if feed is not very abundant, Devons are preferable, as they thrive on scantier fare. 6, The best mixture of grass for the lawn, is simply Red-top and white clover. Prepare the ground in the finest manner, then sow at the rate of eight quarts of the clover to the acre, and two bushels of grass seed. The seeds-men mix up half a dozen different kinds of grass seeds and clover for lawn sowing, but as these grow quite unevenly they do not make so fine a lawn as a single sort. Orchard Grass, also Rye grass, make a fine lawn, provided at least, four bushels per acre are sown, so as to come up very thick. No other grass or clover should be sowed with these. They come forward in the Spring earlier than any other sorts and keep green later through the Autumn, and if the weather is mild, into the Winter. They must be cut quite often, not be suffered to grow over four or five inches high, otherwise the grass will become coarse, and perhaps spread where not wanted.

Care of an Osage Orange Hedge.

W. H. C., Williams Co., Tenn., wishes to know how to plant and cultivate an Osage Orange hedge.

ANS.—The Osage Orange may be raised from seeds or from root cuttings. The oranges or fruits should not be sown in their natural state as the plants would come up in too thick clusters and much seed would be wasted. Seed already prepared can be obtained of leading seedsmen at 75 cents per pound. The seed should be sown in Autumn or Spring. If sown in the Autumn they will not make their appearance until Spring. Good, rich, well pulverized garden soil should be chosen and the seed put in, in open drills, with a hoe, about eight inches apart, the seeds two inches apart in the row. Cover them about an inch and a half deep. An occasional hoeing or stirring of the ground to keep it clear of weeds is necessary. The plants should be two years old before transplanted, though if the soil in which they have been growing was strong and rich, they may be transplanted after one year's growth, Spring is the best season for planting hedges in northern latitudes, but southward where there is no danger from the "heaving" of the soil in Winter, Fall planting succeeds very well. Before planting, the plants from the seed-bed should be carefully sorted, those corresponding in size and strength should be set together and each one cut down to within two inches of the ground line of the seed-bed and all the longer roots cut back about one-third their length. The hedge line should be laid out and plowed two or three feet wide and pulverized thoroughly. Two parallel trenches eight or ten inches deep should now be dug, and at a distance apart of about six inches, and in these trenches set the young plants twelve inches apart, breaking joints, as the carpenters would say. Press the earth down firmly around the stems and level with a hoe. The season after planting several shoots will be thrown out which are to be shortened back the ensuing Spring to within six inches of the ground, and then cut back each year's growth thereafter to twelve inches. The hedge should be trimmed in early Spring or Fall. Summer trimming is liable to be injurious to the hedge, owing to intense heat.

Planting Corn.

J. F., Bellmore L. I., intending to plant an acre of corn on the plan recommended by the RURAL—that is, in drills—asks for information as to culture, best kind of seed and sort of manure. The soil is a sandy loam, was sod last Spring; then it was plowed, manured well and planted to cucumbers for pickles.

ANS.—Such land should not need much manure. We advise to plow shallow and *harrow* in, say, six loads of farm manure to the acre—or from 250 to 400 pounds of corn concentrated manure such as may be purchased for about $40 per ton of Forrester, Bowker, Mapes; or the same quantity of fish guano or of "Soluble Pacific Guano" may be sown broadcast thoroughly mixed with soil. We should advise you to plant Blount's Corn except that we do not know of any seed offered for sale that has been carefully selected. The Chester Co. Mammoth will on such land unquestionably give you a handsome yield, if high winds do not prevail late in the season to lodge it. The fact is that every farmer should have his own variety of corn. It pays to try different kinds on small plots, and then to save the best ears from the most prolific stalks. Upon such plots—which should be as widely separated as the farm permits to prevent crossing—it is not much trouble to go over it as soon as the "sels" appear and cut off the tassels of all stalks that are barren or less productive than others. Then the most productive will be fertilized by the most productive. We URGE this upon our readers. It will *pay* them to do so. We would advise that the land be put in thorough order. If sufficiently dry roll it and then harrow. If tall-growing kinds are planted, let the drills be four feet apart and drop the corn in the drills, as close as may be, hoeing out at the first hoeing so that the plants stand from one foot to 16 inches apart in the drill. *Do not plow* after planting. Use a shallow cultivator to keep the surface mellow and free of weeds. Hoe and cultivate *flat*. There can be but one object in hilling up corn plants, viz., to kill the weeds. The hills give *no* support to the stalks and soil is taken for the purpose of hilling from where it is more needed—viz., from over the feeding roots.

Braxy in Sheep.

F. M. B., Sodus, Mich., asks what ails his ewes, and a remedy for the disorder. The first sign of the disease is their refusal to eat; in a few hours they throw up their heads and begin to stagger around the yard, and in a few hours more they lie down and begin to bloat, appearing in great distress, but they linger for several days before death relieves them from pain.

ANS.—This appears to be inflammation of the bowels, or intestinal fever, called by shepherds "braxy." It would be more satisfactory if our correspondent opened and examined a sheep. If our surmise is right, the sheep would be found to have a quantity of reddish fluid in the abdomen and the bowels would be of a purplish or a greenish color and of a fetid odor. It is hardly worth while to try to save a sheep when it is down, but when first taken the following treatment is advisable. Give a dose of two ounces of Epsom salts and dip a rug or sack in hot water and tie it under the belly. After the salts have worked off, give flax-seed tea or oat-meal gruel sweetened and put a teaspoonful of saltpeter in it. Repeat this for two or three days. Keep the sick sheep very quiet by themselves. It is the result of too much dry food. Smutty corn or corn fodder or musty food will cause it.

Small Fruits in Southwestern Kansas.

J. H. H., Garfield, Kansas, asks what sorts of small fruits are likely to thrive in Southwestern Kansas. Experience with fruits there is unattainable as none have yet been planted, and little or no interest is shown in their cultivation by the new settlers who comprise all the inhabitants there.

ANSWER BY PROF. E. GALE, PRESIDENT OF KANSAS STATE HORTICULTURAL SOCIETY.

The writer of this query will find it difficult to succeed at first with the varieties of small fruit that grow abundantly in the Eastern States. Success with any varieties is not assured. For two years past failure has been the rule in all the western half of the State. We are hoping for a better condition of things the coming year. But our first, second and third injunction to all planters of small fruits on the plains is, GO SLOW. You can discard all red raspberries. Strawberries will need careful mulching in Winter; and always plant something for protection—plant shelter-belts at once. Don't wait to see if you need them, for you will. Plant corn or sorghum or anything that will keep the wind off your garden the first year or two. There are reliable nurseries all through the West. Send to any of them for their catalogues. Then order direct from them either by express or mail, and you will do better than to order through any of the traveling agents.

Queries on Drainage.

W. L. F., Wyoming, N. Y., asks, 1, whether a good drain can be made of stone at a less expense than one of tile; 2, if tiles are used should a layer of stone be put on top of them; 3, how much more surface will a ditch three feet deep drain than one 2½ feet deep; 4, the name of the best work on drainage, its price and where it can be got.

ANS.—1, A stone drain may be made as serviceable as a tile drain, and in some cases better. When a sufficient supply of flat stone or stone that can be laid snugly, can be got, the drain may be laid as follows: a row of stones is laid at each side of the ditch, close to the side that the water may not pass behind, and these are covered with flat stones so that the joints are broken and protected. Above these upper stones is laid a quantity of rough or round stones for a foot in depth, and the earth is filled over these. If well laid such a drain will be permanent. 2. When tile is laid no stone should be placed on them or there will be great danger of breaking some of the tile by the pressure. 3, A ditch 2½ feet deep will drain as much ground as a deeper one. Drains are rarely made deeper than 2½ feet now. The mania for deep draining has been cured of late years: 4. Klippart's Land Drainage is the best work on this subject; price, $1.75, to be had of the American News Company.

Bermuda Grass.

R. N. K., Floyd, N. Y. asks where can seed of Bermuda Grass be obtained, and whether it would be likely to thrive in that section.

ANS.—It cannot be obtained unless possibly from the West Indies. It does not seed in this country, though many suppose it does. Upon careful examination of the flower spikes, however, very few if any seeds will be found. It is propagated by cuttings alone. These may be procured in Georgia and other Southern States. We have no positive information as to whether it would endure the Winters within the above section. According to Mr. Killebrew, it thrives on the top of Lookout Mountain which is 2,200 feet high.

American Seabrights.

E. A. F., Brighton, Ohio, asks for information about the American Seabright fowls.

ANS.—American Seabrights are a mongrel variety which don't breed true enough to get a place in the "American Standard of Excellence." Several generations of them have been sent to Buffalo Shows with as many kinds of combs, &c., as there were generations. There is a class of fanciers who would never be satisfied except with a breed of their own origination or an undoubted mongrel. For such people American Seabrights ought to fill the bill. We do not know who originated them.

Miscellaneous.

A. S., Eagle Harbor, Mich., has a well that is dug for 14 feet and drilled for 45 feet more; the water rises to the top of the drill hole, and he thinks there is water enough below to make it rise to the top of the well were it not that the seams are too close; and he asks whether a heavy blast exploded at the bottom would be likely to open the seams, and whether it would injure the upper part of the well, which is "piped" to within two feet of the bottom.

ANS.—In similar cases in oil wells recourse has been had to what are known as "torpedoes," which are tin cartridges loaded with nitroglycerine. These are lowered to the bottom of the well and are exploded. The effect of this powerful explosive is to shatter the rock, and if any seams are near to the boring, to open them and increase the flow of the well. The use of such a device in the above case may cause a freer flow of water, but the pipe should be drawn out of the well before the cartridge is exploded, otherwise it will probably be hurled out by the discharge. It is hardly probable, however, that the water will rise to the top of the well, as the hight to which water rises depends not on its abundance in the subterranean reservoir, but upon the hight of the fountain-head. If this, however distant, is higher than the mouth of the well, the water will overflow, as in an artesian well; but the water will never rise spontaneously in the well higher than it is at the fountain-head.

W. H., Van Wert, Ohio, asks, 1, whether Persian insect powder will not kill cucumber and squash vines instead of the insects that injure them; 2, whether more flax seed cannot be raised on land by sowing one bushel per acre than by sowing three pecks per acre; 3, in trimming grape-vines how many of the joints should be left on to secure the most fruit.

ANS.—1. It will not kill the vines. 2. That depends. If the land were rich and well prepared we should prefer the three pecks, as each stalk will then have more branches and therefore produce more seed than if sown more thickly. When flax is grown for seed, from half a bushel to a bushel per acre is sown; the richer the ground the less seed is required. 3. We cannot answer. Rank-growing vines, like the Concord, should be permitted to bear more than feeble growers like the Delaware. The thrift of the vine must answer the question. Generally in amateur cultivation vines are permitted to bear too heavily.

D. E. S., Norton, Kansas, asks, 1, what is the best plant for a permanent hedge for line or road fence to turn stock—evergreen preferred; 2, how much seed would be needed to raise plants for three miles of hedge; 3, where could seed be obtained, and at what price; 4, how to sow the seed, cultivate and transplant. Our inquirer is prejudiced against Osage Orange for a fence.

ANS.—1, Evergreen Thorn and Honey Locust, the former (evergreen) is armed with thorns. 2. Buy a pound of seed, count them, and allow one-third for poor seeds. 3 From Thomas Meehan, Germantown, Pa., or J. M. Thorburn & Co., 15 John Street, New York. Price of Honey Locust about 50 cents a pound. 4. These questions have been answered in previous numbers, to which we must refer our inquirer.

W. E. B., Springfield, Mo., has a Short-horn cow whose calf is three months old, and being anxious that she should breed again, but not knowing when she comes into heat, as she runs by herself, he asks for some treatment that will bring her into breeding condition, and how this can be ascertained.

ANS.—It is very often that a cow does not come into breeding condition for two or three months after having a calf. The arrival of the period may be known by the cow being very restless and uneasy, carrying the tail to one side, bellowing continuously and anxiously looking around as if looking for something. It is better to wait for natural effects than to try to bring it on by feeding which is very rarely of any benefit.

T. L. P. C., Cartersville, Va., asks where can the seed of Sheep's Fescue Grass be obtained, also Burnet seed, and the price of both.

ANS.—Sheep's Fescue, a free grower on high dry pastures, having the chief merit of affording a pasture for sheep where better grasses will not thrive, can be had from J. M. Thorburn & Co., 15 John St. N. Y., price 25 cents per pound. Seeds of Burnet, a vegetable used chiefly for salads and soups, can be had from the same firm for 20 cents an ounce, or $1.50 per pound.

B. C. C., Goliad, Texas, asks how soon should the top be cut off after inserting the bud in budding peach trees in June.

ANS.—In your climate if the bud were inserted in June, we should cut back the top as soon as a thrifty growth of the bud has been made.

A. M. S., Greenbush, Ia., asks whether the dentaphone will do what is claimed for it, and whether the company that advertises it is trustworthy.

ANS.—The dentaphone is in some cases a help to the deaf; but in others—and these seem to be the more numerous—it is utterly worthless. The manufacturers we have found fairly reliable. Of course, like dealers in other wares they dwell most on the successes of their device.

F. W., Rising City, Neb., asks where he can get Alfalfa seed.

ANS.—From all prominent seedsmen who advertise in the RURAL. The usual charge is 30 cents per pound for California seed—Alfalfa; and 45 cents for Lucerne, both being the same, except that one is raised at home and the other imported.

F. W., Cambridge, Mo., asks where and at what price can the Double Red-flowering Thorn and the Calico Plant be obtained.

ANS.—These can be purchased of many of the nurserymen whose catalogues have recently been noticed in our columns. The price is for the Thorn about one dollar and for the Calico Bush (Kalmia latifolia) from 50 to 75 cents.

R. J. L., Havana, N. Y., asks where the Weeping Beech can be had and its price.

ANS.—Of every nurseryman that advertises in our columns. It is a magnificent tree; slow to start—slow to grow for the first two or three years—but it is a joy after that. Our best specimen is now seven years old from the nursery. It is about 12 feet high.

J. J. J., Logansport, Ind., asks where can "smooth" barley be obtained and at what price.

ANT.—We do not know what is meant by smooth barley unless it is "hulless barley," which is about the same, as compared to ordinary barley, as hulless oats are compared to ordinary oats. J. J. H. Gregory of Marblehead charges $8 per bushel for it.

Wm. M. N., Darien, Conn., whom we thank for various suggestions, asks if Mr. Charles Downing is the author of "Fruit and Fruit Trees of America."

ANS.—A. J. Downing is the author, but Charles Downing has revised, corrected and largely added to the valuable work. It can be obtained through the American News Company of this city, price $5.

W. M. N., Burbank, Ohio, asks which is the best harvester—twine or wire.

ANS.—That made by Walter A. Wood—twine or wire—is an excellent machine; so is the New Adams and French machine, with Fair's Cord Binder; the Buckeye Wire Binder, made by Aultman, Miller & Co., is also fine.

O. E., French, Linn, Wright Co., Ia., says:—1, Will Professor I. P. Roberts please give name and address of the manufacturers of the hay sling described by him in a late RURAL; 2, Please, give the name and address of a company that makes a good two-horse hay rake 12 feet wide.

ANS.—See adv. columns of next issue for hay-sling.

W. T. G., Address mislaid, sends us kernels of what he calls Diamond Spring Wheat, which are very long and handsome. He says it has long heads, and he would like to know if we or our readers have had experience with it.

ANS.—We have not.

N. S., Slater, Indiana, desires name of evergreen sprig.

ANS.—We cannot tell from this specimen. It seems to be a Juniper.

BURNETT'S COCOAINE

Promotes the Growth of the Hair,

And renders it dark and glossy. It holds, in a liquid form a large proportion of deodorized COCOANUT OIL, prepared expressly for this purpose. *No other compound* possesses the peculiar properties which so exactly suit the various conditions of the human hair.

The greatest appetizer, stomach, blood and liver regulator on earth—Hop Bitters.

Important.

Have you found the key to perfect health and strength? It is Kidney-Wort, the only remedy that overcomes at once the inaction of the kidneys and bowels. In either liquid or dry form it is a perfect remedy for those terrible diseases that cause so many deaths.—Home and Farm.

Women that have been given up by their dearest friends as beyond help, have been permanently cured by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. It is a positive cure for all female complaints. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 50 cents per box.

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

(Continued from page 245.)

CHAPTER XIII.

SOME SOCIAL QUESTIONS DISCUSSED.

MR. GLINDEN proposed to me one day that I take a ride with him into the country. His brother-in-law occupied a farm some miles out of the city, and it was to visit him and to give me an opportunity of observing country life that the trip was projected.

We set out directly after breakfast one morning in an elegant little carriage drawn by a superb horse which was attached to the vehicle in the manner which I have before described. This noble animal bore us along at a pace which to me was peculiarly exhilarating from the mingled sense of fear and security which kept my heart in a flutter. When I looked upon the horse dashing along as unrestrained by bit or bridle as if he were upon his native plain, my hand involuntarily grasped some projecting part of the carriage for security. But when I turned to Mr. Glinden sitting with his arms folded across his breast as composedly as if he were in his easy chair at home, reason rose above fear, and gave me a sense of safety.

I enjoyed a conversation with Mr. Glinden more than with any other person whom I met, because he seemed able to adapt himself readily to my level. This was doubtless owing to the fact that he was a student of history, and familiar with the manners and institutions of people which bore some resemblance to my own.

Our conversation this morning naturally turned toward the peculiar customs and institutions of the country, concerning which there were ever new questions arising in my mind to be resolved.

"How is it, Mr. Glinden," said I, "that these family portraits and monuments of art which form a part of the very walls of your homes are completely preserved in your households for so many hundreds of years? Is there no changing of dwelling place among your people from city to country, or from country to city, or from one city to another? Are there no fluctuations of fortune among you which make the wealthy of one generation the paupers of another, and thus strip many a noble family of its ancestral home?"

"There are neither changing of residence nor fluctuations of fortune among our people," replied Mr. Glinden. "Every house is regarded as the heritage of the male line in each family, and is handed down from father to son in a succession as unalterable as the family name. And not only is each family bound to its home by its veneration for these ancestral monuments, but the different pursuits and occupations of our people are also hereditary, so that a son succeeds to the business or occupation of his father with the same regularity that homes and lands are inherited. Each family is, therefore, bound to its own locality by the additional demands of its peculiar occupation."

"You surely do not mean to say, sir," said I, "that your laws or social customs bind a man for life to the occupation of his fathers. Must a ditch-digger or a street sweeper plod on in his humble and laborious, though it may be, very useful life, simply because his father has followed this occupation before him? And is he denied even the possibility of raising himself above his humble station, however strongly he may desire, and however capable he may be to attain a higher position in society?"

"Unfortunately for your illustration," replied Mr. Glinden, "there are neither ditch diggers nor street sweepers among us. If you mean to imply that this social custom of ours shuts the door on ambition and prevents a man of superior capacity from filling a station suitable to his ability, I will say in reply, first, among us a man's ambition is satisfied when he fills a station that is useful, and has made himself as competent as may be to fill it well.

"Second, not even the president of one of our universities receives greater marks of consideration on account of his superior station than the humblest member of our society. We may honor him for his superior abilities and attainments and look up to him as one whose opinions and counsel we respect and value, but not one among us would turn his back upon his servant merely to court his attention.

"Third, by the laws of hereditary descent, those mental faculties which are habitually active in the parents will be transmitted in a corresponding degree of activity to their children. And as it is the custom for families pursuing the same occupation or business to intermarry, a natural bias of mind is thus received from both parents by the children of every family toward their peculiar hereditary occupation.

"The laws of hereditary transmission are so well known among us that a man might readily beget a child of a native ability much superior to his own. But he is too wise to do so. He knows that there is but one preacher for every ward, of perhaps five or six thousand souls, and that the teachers, professors and men high in the realm of science must necessarily be few in comparison with the many who must devote themselves to providing for the creature wants of themselves and their fellow-men. If, therefore, the carpenter, the mason, or the blacksmith should say, 'I will endeavor to give my boy a genius for oratory, or endow him with the natural capacity for a professor of any science; he would be directing his aspirations toward pursuits which were already as fully occupied as the best interests of society demanded. And he would be making of his son an inferior preacher or man of science when it would be better for the boy as well as for society that he should endeavor to make him a good carpenter or blacksmith. According to the operation of the law which I have spoken of, a preacher who has a long line of ancestry behind him who have devoted themselves to this occupation would be a natural preacher, and he would be able to transmit to his son the necessary talents for this avocation in a fulness and completeness which the most ambitious carpenter could never hope to achieve. So you will perceive that a man's sense of what is reasonable and right concur in making him contented with his hereditary occupation."

"Your remarks, sir," I replied, "appear to be founded on reason. But I must confess that it is a very difficult matter indeed for me to conceive of a state of society founded upon such lofty principles that no one of its members has any higher ambition in life than to make himself as useful as he can in the sphere which fate has decreed that he shall occupy, where there are neither envyings nor rivalries between individuals of different stations, and where each individual accepts his peculiar lot in life cheerfully, and performs its duties faithfully, from the conviction that his own best interest as well as those of society will thus be subserved. There are some interesting queries, however, which naturally arise in my mind from your remarks. First, from what class of the people are your officers of Government chosen? Or is office-holding hereditary among you like the other occupations of your people?"

"The machinery of our government is very simple," replied Mr. Glinden. Public, like private stations are hereditary, and on the same general principles. Chief among these is the native bias toward a particular pursuit which a child inherits from a long line of ancestors who have followed the same occupation and which gives him a facility in the performance of the duties which the most diligent application of one born to a different pursuit can never achieve."

"But, sir," I rejoined, "it certainly appears to me very unjust that the honors and emoluments of public office should be conferred on some individuals because they happen to be born in an office-holding family, while many other worthy citizens must plod on in their humble mode of life merely because their fathers have done so before them. Besides, is there not great danger that those to whom the offices of government are assured from generation to generation will take advantage of their hereditary power to promote their own or their families' interests at the expense of the public good?"

"These are objections," replied Mr. Glinden, "which arise very naturally in a mind that has no higher stand-point from which to judge of human nature than that which must necessarily be yours from your natural relations with a people among whom the supremacy of the intellect, and moral sentiments over the selfish and animal principles of our nature is still only a vague vision of the future. Among us this supremacy is so complete that every citizen acquiesces in the dictum, that whatever promotes the good of the public promotes the good of the individual. While the humblest member of our society would regard it as degrading to his personal worthiness to allow his mind to be disquieted by aspirations after a public office which are merely the outgrowth of a desire to be an object of popular attention. Among our early ancestors ambition often took this direction. Men sought office, and spent half their fortune in the most iniquitous manner in securing it, merely to gratify a selfish vanity which was pleased with the empty applause of the multitude. They expended money lavishly upon the adornment of their persons and their houses that they might outshine their neighbors in the splendor of their style, and excite the gaping wonder of the common throng over their pomp and magnificence.

"Happily the day of this vulgar love of applause has long since gone by; and among us, if a man seeks the applause of his fellows at all, it is for duties faithfully and well performed in the particular sphere in which it has been his lot to be cast.

"In regard to an office-holder using his position for the purpose of promoting his own or his family's interests at the expense of the public good, I may say, that during the whole course of my long life I have never know of an instance where the slightest breath of suspicion has been cast upon the character or conduct of a public officer. In fact, the words peculation, embezzlement, fraud, theft, etc, which were formerly so frequently used in connection with offices of trust, are now obsolete."

"Peculation, fraud and theft obsolete!" I exclaimed. "Can it be possible for poor, frail humanity to attain to such a high condition of morality that there shall be no need of words to give expression to such an unworthy class of ideas?

"There is another query," I continued, "which your remarks have raised in my mind. You say that there are no fluctuations of fortune among your people. Now I would like to know how it is possible for the immense business of this great country to be carried on without fluctuations of fortune."

"It is not a matter of much difficulty," replied Mr. Glidden, "when reason and moral sentiment combine in directing and controlling public and private enterprise.

"I will not enter into a discussion of the causes which in the olden time made the wheel of fortune revolve with such uncertain movements that the poor might ever live in hope and the wealthy be ever on their guard. But I think it is undeniable that the inspiring motive in those days was selfishness. Wealth was then the goal of human ambition, and men strove to reach it with a selfish zeal in which the interests of their neighbors were completely lost to view. They had not then learned the important lessons that the truest interests of the individual lies in the direction of the best interests of the community, and that in promoting the happiness of their neighbor men are both directly and indirectly promoting their own.

"These lessons have become practical realities with our people, and they constitute the very warp and woof of our social and business intercourse. No one among us seeks to heap up riches to himself, because he knows that in proportion as he has more than enough for the comforts and such enjoyments of life as the condition of society among us makes necessary, another must have less, and if all were actuated by this desire for accumulating, the harmonious relations of our society would be subverted, and our happiness as a people destroyed.

To be continued.

MAGAZINES FOR APRIL.

APPLETONS' JOURNAL. CONTENTS:—A Question: a Greek Idyl; Mysteries and Miracle-Plays; Oliphant's Land of Gilead; On some of Shakespeare's Female Characters, II. Portia; Greek Dinners; Why does the Crab go Sideways? A Culture-Ghost: or Winthrop's Aventure; The Caliph Haroun Alraschid; The Earl of Beaconsfield as a Novelist; Ruskiniana (Ruskin's Arrows of the Chace); Concerning the Cheerfulness of the Old; (the Country Parson), Editor's Table: Carlyle as a Thinker—The English Estimate of Carlyle—Tact not a Special Feminine Quality. Notes for Readers.

It is narrated by one of the biographers of Fox, that, after playing at Almack's for twenty-two hours without intermission, he rose from the table a loser to the tune of eleven thousand pounds. The fashionable gamblers of that negligent time were accustomed to find themselves occasionally on the side supposed to be agreeable to Cato; and to all of them in turn, as they staggered homeward in the dawn with empty pockets, might have been applied the line in the "Fasti:"

"Inde domum redeunt, sub prima crepuscula mœsti."

But the losses of Fox had been so enormous on this occasion, that his friends feared lest he should be prompted to some desperate act. Accordingly, they betook themselves to his house, and, unseasonable as was the hour, brushed the servants aside, and insisted on forcing their way into his presence. They found him prone upon the hearth-rug, leaning upon his elbow, reading a chapter in Herodotus.—Appletons' for April.

LIPPINCOTT'S MAGAZINE.—Contents: A Peep at the North of Ireland; Characteristic Dances of the World; Zoological Curiosities; On a California Ranch; At Night; John Henry; Present Tendencies of the French Drama; The Zoar of the American Loyalists; The Wounded Singer; Sister Weeden's Prayer; Wash Lo; After Betrothal; Nineteenth Century Notes; Our Monthly Gossip; Literature of the Day.

THERE is no account of the origin of dancing, but, combined with music, it is practised by every nation on the globe, and the foundations of it lie in the human constitution itself. Its earliest form was probably a rhythmical march, since the innate feeling for rhythm would instinctively induce men when walking to regulate their song and steps to a certain recurring order or measure. Again, a superabundance of animal spirits leads naturally to one form of dancing,—a motive we see constantly exemplified in children, and even in animals. All savage nations dance primarily from this motive. Captain Stedman, in his "Narrative of an Expedition in Surinam," says that he has seen a negro, for want of a partner, figure and foot it up for nearly two hours to his own shadow against a wall.—Amelia E. Barr in Lippincott's for April.

NEW PUBLICATIONS.

The Ladies of the White House, or in the Home of the Presidents. By LAURA C. HOLLOWAY. Philadelphia: Bradley & Co.

This book is well and attractively bound. The contents, however, is the more important consideration to the appreciative mind for whom the work is intended. Mrs Holloway has given a history of all the ladies who have graced the Presidential Mansion in the capacity of hostess. The careful collection of facts must be the result of much labor, and the public should feel grateful to the author for the entertainment as well as the extended knowledge imparted. The opening leaves reveal the portrait of Martha Washington, accompanied with biography of this noted woman, and incidents of her career. Following in illustration and description are her successors, including Mrs Garfield, whose record of necessity, is incomplete. Nellie Grant is included in this book gallery, and is a charming addition. The varied style of physique and exposition of character form an interesting study of human nature, and one which many young women might profit by. These words are but a few of the many which could be said in praise of this book; but why waste time in depicting what surely is worthy a practical test. We add but one thought of disparagement; why not have called it "Women" instead of "Ladies" of the White House, a much grander title.

Pearls of Thought. By MATURIN N. BALLOU, Boston; Houghton, Mifflin & Co. Price $1.25.

Works of like character have been published previously by this author which will serve to introduce this the latest one to readier notice. It is valuable as a reference for quotations. The words of eminent authors are classified alphabetically as to topics, thus rendering it easy to secure something appropriate for almost any subject.

The King's Missive and Other Poems. By JOHN G. WHITTIER. Boston: Houghton Mifflin & Co. Price $1.

This little book contains thirty-two poems, most of them late productions from the pen (or brain), of the venerable and esteemed quaker poet. Every new poem increases in value from the fact that the prospect for successors is lessening.

Lennox Dare. By VIRGINIA F. TOWNSEND. Boston: Lee & Shepard. Price $1.50.

This novel is written in the usual vein of this well-known author. It is calculated to interest the reader who seeks entertainment as a reward of perusal.

For Women.

CONDUCTED BY MISS RAY CLARK.

PERFECTION.

GRISELDA is a pattern maid,
Whom nothing can excite,
By all her slightest word's obeyed,
She's always in the right.

Her prompt decision is superb,
She knows no wicked spite;
Her calmness naught can e'er disturb,
She's always in the right.

No breeze that blows can rough her hair
To rude unseemly plight,
No mud to soil her dress would dare—
She's always in the right.

Her steps she bends where she should go,
She scorn's the world's delight;
She answers "Yes" she answers "No"—
She's always in the right.

Her figure's tall, her eyes are pale,
Her form is spare and slight;
Her thin, red lips no faults bewail,
She's always in the right.

She always does the thing she should,
Her sayings sages cite,
Because, you see, 'tis understood
She's always in the right.

Should I wed her, they say, my life
Would be serene and bright;
But, oh, I would not want a wife
Who's always in the right.

No, no! My bride must have a fault,
Or we'll ne'er jog along;
That woman isn't worth her salt
Who's never in the wrong.

POINT LACE MAKING FOR GIRLS.

FRIENDS:—There will probably be some time yet, before the warm breath of Spring will warm the earth sufficient for commencement of work in your flower garden, so in the mean time why not make yourselves a good supply of laces? The cheap imitation lace that many of you are wearing does not wash nicely, and is often thrown aside and replaced with new during the season; the money thus spent, if it was used to buy point lace braids and thread, would supply you with the most beautiful and durable collars, cuffs, barb points, straight lace, &c., at no great expense of time, or trouble of making up, provided you are familiar with the use of the needle. You can, with a little care in learning the real lace stitches do this as easily as you can hem a handkerchief or do ordinary sewing. The first thing necessary is a pattern, and these are procured in various ways. Fashion Magazines often contain beautiful printed patterns of many articles.

Modern lace workers use a fine, closely-woven braid which very much shortens the process, and is a close imitation of the ancient hand-wrought web that formed the design of the pattern. These are made of pure linen, and are basted firmly to the pattern following the figures and outlines, being folded down neatly so as to make the points and square corners of the figures. In following curves or circles baste down the outer edge of the braid, leaving the inner edge to stand up full or ruffled. This must be gathered down to fit the pattern—by the whipping-over process, drawing the threads as the work proceeds. The next thing is the real lace "filling in" stitches. When these braids are connected by irregular threads, they are called brides in France, legs in Italy and ties in England. These threads are often twisted together and also worked over in common button-hole stitch, forming straight or irregular bars.

The most common "filling in" stitch is Point de Bruxelles (or Brusselles net) as it is sometimes called. This is made by commencing at the left hand and on the edge of the braid; work a row of loose button-hole stitches just as you would on an edge in white embroidery. The spaces between the stitches form the "mesh" of the lace. You now have the thread at the right hand. In returning make another row, putting the needle through every mesh of the first row, drawing up the threads so that they are pretty close and even. Afterwards use your own judgment as to size of mesh. Continue to make these rows, one after the other diminishing and increasing, to fit the space to be filled. If any of you cannot make this Bruxelles lace stitch, and wish very much to make your own laces—and to learn it, I will send a few made on dark cambric free, and answer inquiries as to braids, patterns, &c., if you will send me a stamped envelope addressed to yourself. If this is printed I will send you descriptions of other stitches soon. POINT LACE.

[NOTE.—The writer of the above promises illustrations and descriptions of the work for publication. If the address is wished, please apply at this office and a card of information will be forwarded to you.] R. C.

CORRESPONDENT'S CORNER.

WILL some of the RURAL ladies write us a chapter on girls graduating dresses? I have a daughter who will graduate in June, from a popular Female College. Of late years the graduates have all dressed rather expensively; but the class, (20 in number) this year want a dress that will be useful after commencement, something that can be laundried. Will not some of the RURAL sisters advise me as to material, make, etc?

Can any one tell me what Paris muslin is?

What color would you advise in silk for a young lady, something suitable for most seasons of the year and that will not fade or loose its freshness. By answering all these queries, you will oblige a friend of the RURAL. MRS. B. A.

Paris muslin is mull. Space in present issue will not allow of answer to the other questions. We would be pleased to have the information from the source requested. R. C.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

ANOTHER WEEK FROM MRS. CLAY'S JOURNAL.

ANNIE L. JACK.

MONDAY.—There were a great many remarks passed and much solemn protestation among my friendly neighbors when it was understood that I did not intend to keep a servant after Janet left. But months have passed since then and a new baby occupies a share of my attention; yet I do not regret the step I have taken. For with my sister and little daughters the wheels of our household machinery go smoothly, and we are able to get a char-woman at regular intervals for the heaviest work. It gives one a feeling of independence to be able to do this, and it is a good school for young girls, whose business in life must always be that of housekeepers. So Celia and Karen take turns in the lighter duties of house-work, and my sister, who has a knack for cookery, takes pleasure in its nice details. Of course, there is the dish-washing, and it is indeed the greatest lion in the path. But with plenty of hot water and towels, a couple of mops and a draining board, it is not difficult to get through this wearisome task. I was in a house the other day, that caused me to moralize on the tidiness of housekeepers in general. They were people who made pretensions to some style as well-to-do farmers. Yet the mistress of the house sat and combed her hair in the kitchen close to the stove, because the bed-rooms were cold. The cooking stove was not ornamented with a tea kettle, the old one having been worn out more than a year before, and a saucepan was used for heating the water. Yet these same people gave away a ten-dollar present at a wedding and did not seem to know that charity begins at home. The chore boy brought in water from the well at a little distance and filled a barrel in a corner of the kitchen; when this was done, he took a tin cup, dipped it twice into the barrel and drank, the second time returning what he had left to the barrel. This water was for household use—drinking and cooking purposes, and I mention this little act to show how small habits of uncleanliness will be noticed, and to enforce the necessity of acquiring tidy methods in all housekeeping. I suppose these thoughts came to my pen more readily because a young man came to me lately for advice in a very trying predicament. With some stammering he told me that he knew two girls, and one was a neat housekeeper, always tidy, with an apron or an old skirt over her dress if caught in any dirty work. The other was as good to work, and not an idle girl, but untidy about her clothes, sometimes slipshod, and if he called early in the day sure to run away and slip on her afternoon dress (a bad sign). He knew instinctively when she did this; knew the risk, and yet he felt for her a greater regard than for the first mentioned. I dared not advise in the case, but only consoled him with the fact that he was taking the risk with his eyes wonderfully open.

PATENT CHURNS.

IN the Autumn of 1866 my husband and myself, in company with a wagon-load of our neighbors, attended an agricultural fair at Bath, Steuben Co., New York. Since then I have many times thought to write of a churn I saw there, but I believe pure laziness has each time prevented me. Now, I have always contended that the good old dash churn with which our foremothers used to coax the butter to separate from the cream, was the proper instrument; and any innovation by calf, sheep or dog power was not to be allowed for a moment. But there is nothing so useful in causing a person to change his opinions as a good bit of experience seasoned with hard work. This I have had, and I now cry for some other power besides animals or man, to operate the churn. And this brings me back to Bath, and the Fair. There were churns and churns and churns on exhibition. Some of them made a noise like a thrashing machine, and were as hard to operate as a fanning-mill. Others had no inside works but tumbled over and over cornerwise. One was made of tin like an overgrown lard can, and turned on a pivot, swishing the cream round and round until every drop turned to butter! All these required the assistance of a good stout pair of hands while performing their duty. They were all an improvement on the old dash churn; but none of them exactly hit the mark.

Away off in one corner, toward the sheep pens, I saw a crowd of men and on inquiring of my "other half" the occasion of such a gathering was told. "It is another of those patent churns; I was hoping you wouldn't see it." Straightway I remarked: "I must see that one, too," and he meekly acquiesced, and we went to see it.

Now I am not a machinist nor am I a clock-tinker, and if I fail in giving an accurate description of this "help to womankind," you can attribute it to the aforesaid fact.

As near as I can tell it was a system of pulleys with one immense weight, which was to be wound up like a clock, and being set going would churn until run down. If the butter did not come then it was wound up again. As this was really a labor-saving invention, of course the men didn't invite their wives and sisters and somebody else's sisters to look at it. It was the old story of the young man going to church on horseback, while his sister had the choice of walking or staying at home.

I talked about that churn all the way home, but not a word did "my wayward pardner" vouchsafe in reply until we were almost home, when I heard this comforting remark: "I ain't going to get no patent churn. You'd be wanting a washing machine next, and then 'twould be a wringer, and the goodness only knows what next. No, mam; I'm going to git one of them K——— reapers, though; didn't it do splendid work! No use in breaking my back with a cradle, when I've got money enough to buy a reaper. There's butter enough in the cellar to almost pay for one. I ain't pastured eight cows all Summer for nothing." Of course I subsided, as was fit and becoming for a "weaker vessel;" but that churn has been in my head at little odd spells ever since.

Improvements that do not lessen the work which a woman has to do, or make it easier for her, are comparatively useless, except to the manufacturer. What is wanted is a churn that will do the required labor, without any labor of woman or man or dog or calf or sheep; and not one that requires both hands of the overworked woman to furnish the power. There are hundreds of patent churns and the one above referred to comes the nearest to my idea of what a labor-saving machine should be; and for a large dairy where the churning needs to be done twice a day, part of the time, it would be far ahead of any churn that must be operated by hand. I use the old-fashioned dasher in a common churn which is much more easily cleansed than square ones—an important item when water is scarce or inconvenient to procure.

Last night I was talking about this churn and trying to describe it, when Willie said, "Ma, I saw one like that at Camp Point, Illinois, two years ago. It had six cog-wheels and the rope that held the weight was fastened to the big wheel and the dasher was fixed to the small wheel." The one I saw had no cogs, but had a groove in each wheel and a complicated arrangement of cords.

"BESSIE VICTOR."

DOMESTIC RECIPES.

Dried-Apple Fruit Cake, Extra.

Two cups of dried apples, soaked over-night; in the morning chop and stew in two cups of molasses one hour. When cold, add one-half cup of butter, three eggs, one teaspoonful of soda; cloves, mace, cinnamon, etc., to taste; one cup of raisins and flour sufficient to make as stiff as pound cake.

Sponge Cake Without Eggs.

One cup of sour cream, one of sugar, nutmeg, a pinch of salt, one teaspoonful of saleratus mixed in the flour. Stir a little stiffer than with eggs.

Hartshorn Cake.

One teacupful of sugar, one of sour cream, one tablespoonful of baking hartshorn, one teaspoonful of salt. Mix not very stiff.

Fruit Stains.

Scalding hot milk will take out berry stains.

Cream Jelly Cake.

In place of jelly, one pint milk, one egg, two tablespoonfuls of corn-starch. Sweeten and flavor to taste. Dissolve the starch in part of the milk; add the beaten egg, stir into the boiling milk and cook. Be careful not to scorch while cooking. Let cool.

For the Cake.

Three eggs, two cups of sugar, one cup of butter, two cups of flour, one cup of corn-starch, one cup of sweet milk, one teaspoonful of soda, two of cream-of-tartar. Bake in three parts.

French Cake.

One-half cup of butter stirred to a cream, one cup of sweet milk, two of sugar, three of flour, with three teaspoonfuls of cream-of-tartar, stirred through, three eggs, one teaspoonful of lemon extract; add a teaspoonful of soda last of all.

Scalded Milk for Coffee.

If you cannot obtain cream you will find scalded milk the best substitute.

Cabbage.

Take half a solid head of cabbage; with a sharp knife shave fine; mix salt enough through to season, and put into a vegetable dish. Take two eggs, beat well, put in a dish with two-thirds of a pint of good vinegar, set on the fire, stir till boiling, and pour over the cabbage. Put the cover on the dish. When cold, slice two or three hard-boiled eggs over the top, sprinkle with pepper and you have a dish no oyster supper is complete without.

Brown Bettie.

Put in your pudding-dish a layer of bread crumbs, then a layer of spiced apples, and so on until your dish is full. On each layer of apples sprinkle some sugar, a few bits of butter and a little nutmeg; add a little water. Bake three-fourths of an hour. To be eaten with sweet cream or hot sauce.

Float or French Custard.

Beat the yelks of five eggs with 10 tablespoonfuls of sugar, stir in a quart of new milk; place over the fire and stir until it creams (don't cook too long). Pour in a dish you can cover. Spread carefully over the top the whites of the eggs, which must have been beaten to a stiff froth; cover and leave till cool. Grate nutmeg over the top before serving. This is nice for tea.

For Diarrhœa.

First give a preparation of magnesia and rhubarb in the proportions of six tablespoonfuls of magnesia to one of rhubarb. Dose, one teaspoonful taken in a little milk and sugar. After this has taken effect give a teaspoonful of the following "hot drops" every two hours until relieved: one-half pint of alcohol, one ounce of cayenne pepper, one ounce of laudanum, one ounce of camphor gum, one ounce of extract of rhubarb, three drops of oil of peppermint. For chronic diarrhœa, give a half teaspoonful three times a day. The rhubarb and magnesia should, however, be taken first.

Soap.

As Spring is here I send my recipe for making soap. Run off the lye before starting the fire, boil it until it will strip a feather while you can count ten. Add grease as long as it will eat it up. It will be strong, but will not eat one's hands like soft soap. One tablespoonful stirred in warm water will make over half a bowlful of soft soap. I make it in preference to soft soap. It is better and takes less storage. M. J. STEWART.

Omelette.

Six eggs, whites and yelks beaten separately, a tablespoonful of sweet cream, a teaspoonful of salt, one-third teaspoonful of pepper, a small spoonful of butter and the same quantity for the frying-pan. Stir the butter to a foam, add the cream, pepper and salt, then the yelks beaten well, and, last, the whites, which should be beaten until they stand alone. Have the butter in the pan hot and turn in the mixture. Turn and lift the pan as the omelette cooks. Be careful not to burn. Raise the omelette at the edges with a broad knife to keep from burning. Set the pan on the grate in the oven to brown and serve round, or turn one-half upon the other as soon as the top ceases to be liquid. Send at once to table.

MARY B.

Coloring Rags.

It will oblige me if some of the lady readers of the RURAL will send me through Domestic column, recipes for coloring carpet rags. I would like those for red, yellow, orange, blue, green and any other they may think necessary for a nice stripe. MRS. J. S.

Ladies, do you want to be strong, healthy and beautiful? Then use Hop Bitters.

Agents Wanted.

$72 a week, $12 a day at home easily made. Costly outfit free. Address True & Co., Augusta, Maine.

AGENTS WANTED EVERYWHERE to sell the best Family Knitting Machine ever invented. Will knit a pair of stockings, with Heel and Toe complete, in 20 minutes. It will also knit a great variety of fancy work for which there is always a ready market. Send for circular and terms to the Twombly Knitting Machine Co., 409 Washington Street, Boston, Mass.

ACTIVE AGENTS, Teachers, Students, Men And WOMEN Wanted to Sell TESTIMONY OF THE AGES, By Herbert W. Morris, D. D. Author of Science and the Bible, etc. A Grand Array of Evidences to the Truth of the Word of God from History, Natural Sciences, Modern Research and Every Department of Human Knowledge. Recommended by the Press and Leading Clergy of all Denominations. A Magnificent Volume Suited to the Times. Clear Type. Fine Illustrations. Paper and Binding. Sells rapidly and Agents Easily Clear $60 to $100 per month. Send for Description and Terms to J. C. McCURDY & CO., Philadelphia, Pa.

$66 a week in your own town. Terms and $5 outfit free. Address H. Hallett & Co., Portland, Maine.

WORK We are now prepared to start persons of either sex in a new business at their own homes; $1 per evening earned by the industrious. $90 worth of materials easily carried in your pockets. No clap-traps to peddle, or $5 outfit to buy.

Business Legitimate and Honorable.

Any reader of this paper sending their address and a silver dime (or four 3-cent stamps) will receive a valuable package of information and two samples which will do to commence work on. Dont fail to write at once. H. G. FAY & CO., RICHFORD, VT.

Letters answered by return mail.

$5 to $20 per day at home. Samples worth $5 free. Address Stinson & Co., Portland, Maine

Owing to the Failure of the Music House of Earlebach & Co., Germany, we purchased their entire stock of Musical Instruments, and offer them at half cost to make.

Paganini Violin. Celebrated for fine tone and finish. Italian strings, ebony pegs, inlaid pearl tail-piece, fine long bow with ivory and silvered frog, in violin box. Book of Instruction, with 653 pieces music, including all from Pinafore. By express for $3.60. Satisfaction guaranteed, or money refunded. A better violin cannot be purchased elsewhere for $10. G. H. W. BATES & CO., Importers, Boston, Mass.

SALT FOR LAND, FRUIT TREES, etc. FERRIS' LAND INVIGORATOR and CROP PROTECTOR, has in it all the Salt land requires besides other ingredients that make it very valuable. Death to Hessian Fly and other pests. Use it and reap a golden harvest. Large quantity of Agricultural Salt on hand.

EDWIN FERRIS & CO.,
Wholesale Salt and Fish Dealers, 183 and 185 Washington St., New York.

Miscellaneous.

ST. JACOBS OIL
TRADE MARK.

THE GREAT GERMAN REMEDY.
FOR
RHEUMATISM,
Neuralgia, Sciatica, Lumbago,
Backache, Soreness of the Chest, Gout, Quinsy, Sore Throat, Swellings and Sprains, Burns and Scalds, General Bodily Pains,
Tooth, Ear and Headache, Frosted Feet and Ears, and all other Pains and Aches.

No Preparation on earth equals ST. JACOBS OIL as a *safe, sure, simple* and *cheap* External Remedy. A trial entails but the comparatively trifling outlay of 50 Cents, and every one suffering with pain can have cheap and positive proof of its claims.

Directions in Eleven Languages.

SOLD BY ALL DRUGGISTS AND DEALERS IN MEDICINE.

A. VOGELER & CO.,
Baltimore, Md., U. S. A.

Wanted.

A thoroughly practical man, with large experience in putting up canned goods, such as Tomatoes, Corn, etc. To one who can give good recommendations and testimonials, a good salary will be paid, or, by putting in some capital, an interest may be obtained in the business. Parties applying will please to address BOX 47, Brantford Post Office, Ontario.

40 Happy Day, Chromo, Lace, &c., Cards, with name & morocco case 10c. H. M. COOK, Meriden, Conn.

20 Gold and Silver Chromo Cards, with name, 10c. post paid. GEO. I. REED & CO., Nassau, N. Y.

WE GIVE the Social Visitor, largest and best story paper in the world, 6 Months, on trial, and a Beautiful French Writing Box, Imit'n Morocco, containing Lead Pencil, Penholder, 3 Golden Pens, Rubber, Patent Top Pencil, for 35 Cts. Stamps taken. This offer is made to introduce our paper into new homes. Address Social Visitor Pub. Co., Box 3139, Boston, Mass.

A NEW
MECHANICAL LAMP
For Burning Kerosene Oil without Shade or Chimney.
The Famous Student Lamp and Duplex Burners Eclipsed.
NO GLOBE! NO CHIMNEY! NO SUBSTITUTE FOR EITHER! NO SMOKE! NO SMELL! NO DANGER!
An Explosion Impossible! Absolutely Safe!
PERFECTION AT LAST!
WARRANTED not to SMOKE or SMELL. It gives a beautiful, clear WHITE light, and very steady, without the flickering of gas. It gives a light equal to SIX-FOOT GAS BURNER at ONE-TENTH the cost. Made of brass, nickel-plated; the works are hung on jewels, of the best steel, with hard brass mountings. RUNS VERY SLOW, will LAST A LIFE-TIME. It is a very solid, handsome looking lamp—an ornament to any drawing-room. Every lamp is fully warranted, and any one who is not satisfied with the lamp after one week's trial, can return it and we will refund the money.
Price, packed for shipment $7.50
HEKTOGRAPH CO., 22 & 24 Church St., New York.

GOLD MEDAL, PARIS, 1878.
BAKER'S
BROMA

Is a combination of the Cocoa-Nut with other ingredients, invigorating and agreeable alike to invalids and persons in health. To the sick it yields a delicate and tempting beverage, when other nourishment is unpalatable and indigestible. As a diet for children it is invaluable.

Sold by Grocers everywhere.

News of the Week.

HOME NEWS.

At a recent meeting of the New York Produce Exchange, resolutions were passed urging the need of a Constitutional amendment whereby all tolls on goods transported by canals in this State, should be removed. Also that the facilities for canal transportation should be increased so that a larger share of Western trade could be obtained. Canada is the great rival for Western traffic, and her expenditures in order to secure it have been enormous.

A change is soon to take place in the present firm of Scribner & Co., of this city. Mr. Roswell Smith, who is present business manager of Scribner & Co., has purchased Scribner's Sons interest at the reported sum of $250,000, and hereafter the business of each will be entirely distinct. The name of Scribner's Monthly will soon be changed to The Manhattan Monthly, it is thought. Mr. Charles Scribner is said to be contemplating the introduction of a new illustrated weekly similar to Harper's.

Mr. Andrew Carnegie, the New York iron manufacturer, is about establishing a free library for the benefit of his employes at Braddock, Pa., where his steel works are located. Plans are now prepared for a large three-story building to be erected at a cost of $20,000. The lower floor will be fitted up for stores and the upper floors furnished as a library, reading room and a public hall. The library will consist of about five thousand volumes, and, with the income from the stores and the occasional rent of the hall, it is expected to be self-supporting. Let others go and do likewise.

Unfortunately for the general accuracy of our news items, it was not Porter's murderer, Currie, whom we reported dead last week. This rascal is still at large somewhere in the West.

The event of the Brinley sale of antique books in this city, was the struggle for the possession of the famous Gutenburg Bible. It was printed about 1450, and has 1,282 double-column pages. For four centuries the book lay buried in an obscure library at Erfurt, Germany, but it is still in a good state of preservation. It brought the modest little sum of $8,000, and Hamilton Cole is its possessor.

Ex-Vice President Wheeler met with a hearty reception on his arrival home on the 7th inst. He was met at the depot by a company of the National Guards and a great crowd of citizens, and escorted to his residence. Mr. Wheeler said that he now had returned to his fellow-townsmen for the first time in many years, divested of all official title, to pass the balance of his life as a private citizen with them.

The American delegation to the Paris Monetary Conference, consisting of Messrs. Evarts, Thurman and Howe, left this city on the 5th inst. for Europe.

A company has been formed with a capital of $30,000,000 and a charter obtained to build a ship canal across Florida. The work commences immediately. The route is via the Caloosahatchie River to Lake Okeechobee, thence to the Atlantic Ocean near the mouth of Lucie River. This is substantially the same company having a contract to drain Okeechobee.

C. C. Boycott, the harvesting of whose crops in Ulster, Ireland, under the protection of English soldiers, recently created much interest, and whose treatment by the Land Leaguers gave rise to the term "boycotting," arrived here on Tuesday with his wife and a party of friends, and left the same evening for Virginia, with a view of spending a short season in gunning sports. Mr. Boycott was registered on the steamer which brought him over as "C. Cunnlugham."

The Washington Headquarters Commission has taken action looking towards a celebration in 1883 of the centennial of the declaration of peace, and the disbandment of the Army of the Revolution at Washington's headquarters at Newburg.

Ithaca, the site of the Cornell University, gives a majority of 50 against license, making it the largest "no-license" village in the State. Every town in Tompkins County is "no-license."

From $200,000 to $300,000 in silver certificates are daily received at the New York Custom House in payment for duties on imports.

The graves of Confederate soldiers were decorated at New Orleans on the 6th inst. The Grand Army of the Republic contributed floral offerings. In the evening the Association of the Army of the Tennessee had a reunion at Masonic Hall.

The resignation of Andrew D. White as Minister to Berlin has been received by the President. The report comes from Washington that President Barnard, of Columbia College, will be appointed to succeed Minister White at Berlin. President Barnard is a gentleman of high character and literary attainments, and is well versed in affairs. Gen. Hartranft, of Pennsylvania, is also suggested for the place.

A new through line from Boston to Chicago is soon to be established. The new route will be from Boston via, Hoosac Tunnel, Troy, Schenectady, Syracuse, Buffalo, and so westward. The capital stock is $25,000,000.

The jury in the late Seawanhaka case, in which Inspectors Jaynes and Mathews were tried for manslaughter, failed to agree after long deliberation, the result being ten for conviction and two for acquittal.

The remains of the late Senator Carpenter, of Wisconsin, were buried at the Forest Home Cemetery, near Milwaukee, on the 10th inst. The funeral pageant surpassed anything of the kind ever witnessed in that State, the large assemblage and the magnificent floral offerings showing that the late Senator's friends were by no means few.

The Senatorial deadlock on election of Senate officers is still unbroken, but there are not a few in both parties who would be glad to see the end of the struggle.

Judge Robertson has not, at this writing, been confirmed as Collector of the Port of New York. Great pressure is being brought to bear upon the President to withdraw the nomination. The petion for the retention of Gen. Merritt, present Collector, comprises names already covering 55 feet of manuscript. Whether Mr. Garfield will yield or not, remains to be seen.

Improved Appetite and Digestion.

One of the first effects of Compound Oxygen is an increase of appetite and an improvement in digestion. A patient writes: "I was unable to digest my food on account of Chronic Inflammation of the Stomach and Torpidity of the Liver. The Treatment had an almost magical effect from the first. My improvement in strength, appetite, and ability to digest my food is indeed wonderful." Another says: "Can now eat almost anything I wish, though a month or six weeks ago my diet, even a hygienic one, disagreed with me." Another: "My appetite, before very poor, is now excellent. Feeling an elasticity and courage and strength that I have been a stranger to for years." Another: "Have not felt so well in two years. Appetite good; blood circulates well; pains in back, limbs, and lungs have disappeared, and I sleep such sound and refreshing sleep that I begin to feel like a new person." And another: Respiration, appetite, nerves, and sleep all much improved." Our Treatise on Compound Oxygen, containing large reports of cases and full information, sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

AGRICULTURAL NEWS.

Iowa's butter and cheese product last year was worth $19,000,000.....The laws of Kansas are very favorable to the farmer and stock raiser in respect of exemption from execution and sale. He is secure in the possession of 100 acres of land, with all improvements of whatever character, his implements and machinery, two horses, two cows, ten pigs and the year's crops.....Here is what Vennor says of the weather for the last part of the month. "The weather will be very stormy in the Lower Provinces about the 20th, with very high water prevailing, but in the West April will be a dry month. There will be warm weather just following the 20th, ending in thunder storms on the 24th and 25th. Snow storms are probable in the far West on the 25th and 26th, and snowfalls are not unlikely to occur in England at the close of the month. The month will end wet and cold, but on the whole will be like a May month."..... The men arrested in Cleveland, Ohio, for alleged participation in the Missouri land frauds, were discharged last Thursday on account of the entire absence of incriminating evidence against them. They were arrested on the sworn charge of a St. Louis detective, who promised to substantiate his accusation by proof, but though the case was twice adjourned, he failed to put in an appearance.....Some cattle near Watertown, N. Y. are suffering from a mild type of murrain.

Spinal meningitis seems to be be pretty fatal among horses at Hartford, Conn. The Times of that city of April 2, says 30 of them were lying dead on the banks of the Connecticut River a mile or two below the city, and others were under treatment.....M. Pasteur has received the great gold medal of the French Society of Agriculture for his researches on ferments and contagions in their relation to agricultural interests.....It is officially stated that pleuro-pneumonia has been entirely eradicated from Connecticut.....An insurance company has been started in Prussia to insure loss of hogs by trichina spiralis.....Owing to the insane pork scare in Europe, the exports of bacon from New York fell off the week before last to 7,400,000 pounds. The average shipments for many weeks theretofore were 12,000,000 pounds.

M. Tirard, Minister of Agriculture and Commerce, has assured the Tariff Committee of the French Senate, that cereals and cattle will be excluded from commercial treaties.

Australia can freeze mutton so that it will stand a voyage of 70 days and still be solid enough to knock a tramp through a picket fence.....The State Agricultural Department of North California has been experimenting in the cultivation of jute with the most satisfactory results.

The Indiana Legislature has passed a bill authorizing the destruction of all unlicensed dogs. Canines that wished to live had to get their owners to secure a license for them by April 1.....In 1880, France imported 304,320 head of cattle from Belgium, and 764,114 head from Germany. Her importations of live stock from Italy are considerable. .....The total number of cattle exported from Canada in 1880 was 50,904, being 25,596 more than in 1879. Exports of sheep numbered 81,843, and of hogs 700.....Minister Noyes has cabled to Secretary Blaine that the French Government has agreed that all pork loaded upon ships before the passage of the French decree concerning pork imported from the United States, shall be admitted into France, subject only to inspection and with as little delay as such examination permits.....

The supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Seaboard ports, and on rail from Western lake and river ports and frozen in on New York canals is:

	1881. April 2, bush.	1880. April 3. bush.
Wheat	21,752,359	24,382,845
Corn	14,268,409	15,163,948
Oats	3,241,930	2,769,185
Barley	1,979,208	2,633,927
Rye	433,801	690,543
Total	51,673,797	45,040,448

The barley trade at Oswego from Canada is enormous. About 7,459,660 bushels were brought over during the last six months to be converted into beer. The increase has been very rapid during the past ten years. Although the duty is 20 cents per bushel, there is no market so good as Oswego.

Fearless Threshing Machine.

We call the attention of farmers and threshermen to the advertisement of the celebrated Fearless Threshing Machine, elsewhere in this paper. Unparalleled honors have been bestowed upon this machine, at fairs and exhibitions, State, National and International; and, if universal victory at trials is evidence of superiority, then most assuredly was an ex-President of the New York State Agricultural Society correct, in saying of the Harder Machines, "they are the best ever made." And, as equally good and reliable testimony has been borne times without number, persons designing to purchase will do well to consult the manufacturer of the Fearless, Minard Harder, Cobleskill, N.Y.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, April 9

Boston.—Wool.—In the wool market the business of the week shows a fair average, upward of 2,000,000 lbs. of all kinds having been sold. In washed fleeces there is, if anything, a rather better feeling, and prices have been forced down about as low as they are likely to go at present. The new clips of California, Texas, Missouri, Kentucky and other Southern sections are so recently at hand that no possible change can scarcely be looked for, particularly as the trade in manufactured goods is so unsatisfactory. The transactions in Ohio and Pennsylvania fleeces have not been very extensive, and prices have ranged from 40@43c. for X and XX and 43@45c. for medium and No. 1. There is no XX in good condition offering, but many of the manufacturers have fixed upon 40c. for this grade, and are, therefore, inclined to hold back. Michigan and Wisconsin fleeces have been sold at 38@40c., and medium at 40@42c. ₮ lb. Combing and delaine fleeces arn quiet, but prices are steady at 43@45c. for fine delaine; 45@48c for fine and medium combings, and 29@32c. for Kentucky. Unwashed and unmerchantable fleeces remain the same, with sales of good medium unwashed at 30@33c., and fine at from 25@30c. California wools have been quiet at 16@25c. for Fall, and 25@30c. for Spring. Pulled wools continue in request, but at low figures; some choice and fancy supers have sold up to 40@48c., but the bulk of the sales have been in the range of 30@37½c. ₮ lb. In Montevideo wools there have been large sales at 18@19c., in bond, and 30c., duty paid, upward of 500,000 lbs. having been taken. Australia and New Zealand wools have been selling freely at from 38½@42c., and carpet wools have also been in better demand, with large sales of Donskoi, in New York at from 27@30c. ₮ lb. On the whole the feeling is more settled, but with very little prospect of any formidable change.

Chicago.—Wheat in fair demand. No. 2 Chicago Spring, $1 00½@1,03½, cash; $1.05 bid May; $1.06½@106½, June; No. 3 do. 92@96c. Corn in good demand at full prices at 38½@41¾c, cash; 42¾@42¾c May; 42½c June. Oats quiet and weak at 31¾@33½c. Rye active at $1.04@1.05. Barley $1@1 02 Flax seed—good crushing $1.16@1.17. Pork excited and higher on European reports and crowding of shorts by longs at $16.87½@17 cash; $16.90@16 92½ April; $16.92½@16.95 May; $16.87½@16 90 June; $17 00 July. Lard active at $10.75 cash; $10 80@10 82½ May; $10.90@10.10,92½ June; $10.96@10.97½ July. Bulk meats strong and higher; shoulders $5 20, short rib $8,05, short clear $8 35. Butter—Creamery 30@33c, dairy choise 25@27c, dairy fair to good 22@24d, ladle-packed 16@20c, packing stock 13@15c, grease 8@10. Cheese—Full cream 13@14, part skim choice 10½@11c, do. fair to good 9@10c, do. hard 7@8c, low grades 4@5c. Hogs—Prcking in good demand, others quieter and 10c. lower than yesterday; common to good mixed packing $5.40@5.80; light $5.30@5.75; choice heavy $5 90@6 40. Cattle—very full supply and prices 10c. lowe than yesterday; common to fair shipping $4 50@5; good to choice $5.30@5.60; expores $5 75@6.25; corn-fed Texans $4,50@4 90; butchers' steady with a fair demand at $2 50@1.20; stockers and feeders $3 30@4 65; demand very good and business large. Sheep, good demand for choice; common to medium weak and nominal at $4 25@5; good to choice $5 50@5.75; exports $5.90@6,25.

Cincinnati.—Wheat strong; red winter, $1.12. Corn stronger; No. 2 mixed, 47½@48c. Oats in good demand; No. 2 mixed, 39c. Rye strong; No. 2 at $1 17@1 20. Barley firm; No. 2 fall, $1.10; No. 3 do, $1.05@1,07; No. 3, $1; No. 2 spring, 95c. Pork excited and higher at $16.50. Lard in light demand, but holders firm at $10.70. Bulk-meats stronger; shoulders, $5; clear rib, $8. Bacon steady and firm; shoulders, 5½c.; clear rib, 8¼c.; clear, 9c. Butter strong and higher; fancy Northwestern creamery, 36@37c.; choice dairy, 25@27c.; choice Western Reserve, 24@26c.; prime to choice Central Ohio, 20@23c., and common to medium do. 15@180, ₮ lb. Cheese.—The market has ruled firm at 12@13c. for prime to choice cured factory, and 11@11¾c. for late-made Northwestern Hay,—Common, $16@17; prime do, $18.50@19 50 ₮ ton, and prairie hay, $12@13 ₮ ton in bales on arrival. Wheat and rye straw is steady at $8@8 50, and oat straw firm at $9@9.50. Mill Feed.—Bran sells at $14 50@15; ship stuffs at $16 50@16, and middlings at $16@20 ₮ ton in bulk, and 50c. more in sacks on track. Seed—Prime to choice clover sells at 8@8¼c. ₮ lb., and Timothy at $2 70@2,80 ₮ bush. from store. Round lots on arrival would not bring these prices. Flax-seed is steady at $1.10@1.12½ ₮ bush. German millet sells at $1.50; common millet at $1.25, and Hungarian grass at $1@1,10 ₮ bush.

Fertilizers.

Mapes' Potato Manure, $50; Corn do, $50; Fodder Corn do, $47; Beet and Mangold do, $50; Cauliflower and Cabbage do, $49; Sugar Cane or Sorghum do, $47; Asparagus do, $52; Tobacco do, $53; Complete do, (for light soils) $53; Complete do, $52; Grass and Grain Spring-top Dressing, $52; Fruit and Vine Manure, $37; Lawn Top-Dressing—full strength—free from odor, $60; Lawn Top-Dressing (with plaster), ready for use without further mixing, $35; Potato Manure, (Ville Formula, $48 50c; Complete do, (Ville Formula) $49; Complete do, ("A" Brand) $42; Nitrogenized Super-Phosphate of Lime, $38; Nitrogenized Superphosphate of Lime, (with potash) $40; Ammoniated Dissolved Bone, (Moosehead) $36; Potash Bone Phosphate, $37; Ground Dried Fish, (8 to 10 per cent,) $40; Ground Dried Fish, (with phosphoric acid and potash added) $40; Prepared Fish Guano, $41; Pure Ground Bone, Medium, $36; Pure Ground Bone, Fine 38; Pure Ground Bone, Extra Fine, $40; Pure Ground Bone, Meal and Extra Fine, $41; Pure Ground Bone, for Feeding Stock, (in barrels about 200 lbs. each) $60; Muriate of Potash, 80 per cent., bags about 200 lbs each, $42 per ton; Kainit, or German Potash Salts, 24 per cent., bags 200 lbs each, $15; Sulvhate of Ammonia, (barrels about 250 lbs) per lb, 4@5½c; Nitrate of Soda, 95 per cent—per lb, 4@4¾c. All Chemicals subject to fluctuations

Baugh & Sons, Philadelphia, Pa.—Baugh's Twenty-five Dollar Phosphate at $25 for 2,000 lb; Baugh's Economical Fertilizer at $30 for 2,000 lb; Baugh's Raw Bone Super-phosphate at $38 for 2,000 lb; Baugh's Special Tobacco Fertilizer at $38 for 2,000 lb. All delivered on the cars or on the boat in that city.

No. 1 Peruvian Guano—"guaranteed," $56 per ton; Plaster, Nova Scotia, $8 per ton. No cartage charged. A single bag sold at ton rates.

Price List of Stockbridge Manures and Bowker's Phosphates.—For potatoes and roots, $50 per ton; for corn and grains, $50; for strawberries and small fruits, $40; for grass, top dressing, $50; hill and drill phosphate, $45; Bowker's phosphates, $40; Brighton phosphate, $38; soluble bone, $35; pure steamed bone, $40.

[Cincinnati Irish Citizen.]

Mr. John Miller, of 51 West Fifth Street, tells us that he was cured by the use of St. Jacobs Oil of a complicated case of rheumatism of ten years' standing.

PRODUCE AND PROVISIONS.

New York, Saturday, April 9, 1881.

Beans and Peas.—A direct demand from the West has struck the interior and with strong country prices the market here has advanced for prime white. Exporters are shut out by the new rates' but holders are firm in their asking. Green peas plenty, cull and weak at $1.60@1.62½ for Wis. bbls.; So. B. E. scarce and wanted at $2.75 for 2 bu. bag.

Medium and marrow beans fair to prime $2.10@2.25; pea and white kidney $1 95@2.15, red kidney, prime $1.55@1.60, other, $1.40@1.50.

Beeswax.—Demand continues small; quoted at 25@25½c. for Western and Southwestern.

Butter.—Selections of State and Western are quoted at 23@25c; other grades range at 12@19c. with plenty offering at intermediate prices: very poor Western 9@10c; grease 8@9c; new butter does not arrive freely owing to the backward Spring; besides cheese factories are using a good deal of milk. Light supplies of new will help to work off useful lots held better than was hoped.

New Butter.—Creamery, choice 33@35c. including Penn; State sweet 29@30c.; other 27@30c.; Hitchkins 20@29c.; Welsh 20@28c.; poor new 15@18c.

Receipts for week 23,681 pkgs.

Exports do. 298 do.

Stock of butter in New York estimated at 48,131 pkgs.

Cheese.—Export demand has been very light this week, and shipments have been only 14,900 boxes. The home trade is moderate. Of fancy stock prices are be a strong at a slight advance; otherwise the feeling is easy. Quotations are for

Fancy at 13½@13¾c.; do. good and prime, 12½@12¾c.; do. fair, at 11¾@11¾c.; do. half-skimmed, 8@9c.; Wisconsin factory, fine, at 13@13½c.; do. good to prime, 12@12½c.; do. fair to good, 11@12c.; Ohio factory, fine, 12¾@13¼c.; do. good to prime, 11¾@12¼c.; do. fair to good, 10¾@11¾c.; do. poor to fair 8@10c. Skimmed creamery, 6@7c.

Receipts for week, 9,050 boxes.

Exports for week, 15,433 boxes.

Liverpool cable, 69s.

Steam to Liverpool 21s.6d.@25s.

Stock of cheese in N. Y. estimated 59,827 bxs.

Cotton—Has been more freely offered and closed weak at for

April, 10 57@10.59c.; May, 10.65@10.66c.; June, 10.74c.; July, 10 82c.; August, 10.87.; September, 10.53@10,54c.; October, 10 21@10.22c.; November, 10.09@10.10c.; December, 10.09@10.10c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Receipts for the week, 17,418 bales, Exports do. 28,487 do.

Dried Fruits.—Evaporated apples been in active demand for the West and foreign markets, with some 6,000 boxes taken, nearly all at 7¾. Peaches rule at strong prices and have a steady demand. Small fruits are quiet. Quotations are for

Evaporated apples at 7½@8½c. for prime and strict-choice stock; sliced apples at 4½@5¾c. for good to choice North Carolina; 4@4½c. for Va. apples, 4@4½c. for Tenn do; 4½@5c. for State do; 4½@4¾c. for western Ohio and Mich. Peaches at 28@29c. for evaporated peeled; 13½c. for unpeeled do.; N. C. peeled at 19@22c.; for the better qualities, unpeeled peaches at 5¼@5¾c. for halves and 5½c. for quarters. Plums at 15@16c. Blackberries at 8c. for prime. Cherries at 15¾@17c. Raspberries at 25c. Whortleberries 10@11c.

Receipts for the week, all kinds, 273 pkgs.

Exports dried apples, 4,097 pkgs.

Eggs.—Receipts for week, 38,8 8 bbls.; do. last week 16,729 do. The market worked well for sellers and materially higher than at this date last year. Good prices are expected to rule Easter week as no heavy supplies are lookated.

Near points, 19c.; State and Pa., 18½@ 8 c.; Western, 18c.; Southern, 18@18½c.; ducks, 31@32c.; goose 55@57c.

Flour.—The market has shown firmness and in cases a slight advance, with a very good demand.

Latest prices are: $3.70@4.35 for very inferior to choice superfine State and Western; $4.40@4.65 for poor to choice extra State and Western and lots and lines; $4.65@4 75 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4.50@5.40; good to choice do, at $5.40@6.25; very choice up to $6.35@6.50 and fancy at $6.50@6.75; red and amber winter wheat, inferior to choice trade and family at $4.50@5.15; round hoop Ohio, $4.50@4 85; and trade and family brands of do. at $5.00@6.25, the latter for very choice; St. Louis $4.75@5.75 for inferior to good extra; $5.70@6.50 for good to choice and up to $6.75@7 for very choice to very fancy brands; Minn. clear, inferior to very choice at $4 40@5.85; Minnesota "straights," poor to very choice, at $5 35@6.75, and patent inferior to fancy at $5.75@8.15; city mill extra at $5.30@5.65 for the West Indies; do, for England at $4.40@4.75 for poor to choice spring wheat; do, trade and family extras $6 70@6.75; do, for South America $5.75@6.00, the latter for very choice; No. 2 at $3 00@3.70 for very inferior to very fancy.

Receipts for week, flour, bbls. 119,700, corn meal, do. 3,700; wheat, bush. 750,300; corn, do. 579 900; oats do. 157,875; rye, do 48,500; malt, do. 73 600; barley, do. 44,100, beans, do., 5 228; rice, pkgs. 1,025.

Exports for week, flour, bbls. 66,950; corn meal, do. 6,000; wheat, bush 967,800; corn, do. 622,800; oats, do. 1,675; beans, pkgs. 60 rice do. 1,411.

Corn-Meal.—Sales at $3.05@3.10 for Brandywine and $2 50@2.80 for yellow Western.

Fresh Fruits.—Exports of apples for week, 14,185 bbls. The market is dull for anything at all off from prime. A good many are going abroad, but mostly on country account as there is no sure outlet here. Newtown pippins are becoming a favorite rembling sort; and a discriminating dealer assures us it will yet be a feature for late use, and will not go so exclusively to our trans-Atlantic cousins.

Baldwins prime $1.50@1.75; greenings $1,75@1.50; Spitzenbergs $1.25@2; russets $1.25@2; poor and remnants 75c@$1. Fla. oranges plenty and quiet range $3.00@3 for h'f barrel cases. Fla. strawberries have not sold quite so freely. Some left over with quotations at 40@75c per qt. Hot-house berries $1.50@2 do. grapes Black Hamburg per lb. $4@5. Cranberries are almost a dead item. N J. crates freely offered at 87@$1.50. Peanuts quiet: prime Va. hand-picked 4¾@4¾c; extra prime 3¾@3¾c; prime 3@3½c; shelled 2½@3½c; pecans 7@7½c.

Grain.—The unfavorable weather at the West early in the week tended to activity and higher prices, but at the close the feeling is weak. Exports of wheat for the week 1,077,000 bush., for which the latest prices are—

No. 1 white at $1.21½@1.21¾, do. April at $1,20@1,20¾; do. May at $1.18¾@1.19; do. June at $1.17½@1.17¾; No. 2 white at $1.20@$1.20½; ungraded white at $1.17½@1.19¾; mixed Winter at $1.20½; No. 1 red at $1.30@$1.30½; No. 2 red at $1.24@1,25; do, April at

$1.22½@1.22½; do. May at $1.21@1.21½; do. June at $1.19½@1.20¼; do. July at $1.17½@1.17½; do. August at $1.16; No. 3 red at $1.20½@1.22; ungraded red at $1.17@$1.27; rejected Spring at $1.

Rye at $1.08@1.09½.

Corn closed at for

New York No. 2 at 58@59½c.; do. April at 57½@58c.; do May at 54½c.; do. June at 54½@54½c.; No. 3 at 53½@54½c.; ungraded mixed Western at 51@59½c; New York steamer mixed at 56½@57½c., No. 2 white at 60@60½c.; yellow Southern at 58½c.; Pa. yellow at 56c.

Rye at $1.03@1.03½.

Oats closed firm at for

No. 1 white at 52c.; New York No. 2 white at 47@47½c.; No. 3 white at 45½@46; New York No. 2 at 46½@47c.; do. April at 45, do. May at 44; do. June at 44, do. July at 44½ No. 3 at 43, ungraded white Western at 45@50; ungraded mixed Western at 44@47; white State at 48@50½; No. 2 Chicago at 47c. asked.

HAY AND STRAW.—Prime hay has a good demand and is steady in price; the lower grades are plenty and freely offered. Quotations:

Hay, prime timothy at $1.10@1.15 ₱ 100 lbs.; medium timothy at 95c.@$1.00 do.; shipping grades at 85@90c., do.; clover mixed at 95c.@$1 00, clover at 85@90c. do. Straw—No. 1 rye at $1.10@1.15 ₱ 100 lbs.; No. 2 rye at 70@80c, do.; oat and wheat at 60@65c. do.

Exports for week, 2,151 bales.

HOPS.—The market continues quiet, but is held firmly in hopes that the approaching mild weather will invigorate trade. Latest prices are for

	Cents per lb
New Yorks, crop 1880, choice	22 @23
Do. medium	19 @20
New Yorks, crop 1880, low to fair	12 @15
Eastern, crop 1880	14 @23
Wisconsin, crop 1880	14 @22
Yearlings, crop 1879, choice	12 @18
Olds, all growths	4 @10
Pacific coast, new	19 @23
Bavarians	30 @35

Receipts for week, 790 bales.

Exports do., 361 do.

LEATHER.—Quotations are for hemlock sole, 22@23c. for light; 22½@25c. for middle; 22½@24½c. for heavy, and 20@22c. for good damaged.

MAPLE SUGAR.—Prices have been low but with smaller receipts and a more general demand the market is better; good sugar 9@10c; common 8c; Sirup, with can of 10@11 lbs. 75c@$1.

OIL-CAKE.—Western is quoted at $29.50@30 per ton.

POULTRY AND GAME.—Supplies of dressed are still very light and not likely to improve. Sellers do about as they please with prices. Frozen poultry has found a good place this season.

Turkeys, choice frozen, 18@19c; fair to choice other, 15@18c.. Poltn. chickens, broilers, 25@40c; other 22@24c; N. J. and Bucks Co. 18@22c; fowls and chickens, State and Western 14@17c; Phila. fowls, d. p. 17@18c.; N. J. 16@18c.; State and Western 15@17c. Capons, large, 28@30c; small and slips, 23@25c. Ducks, 15@22c. Squabs, white, $3.50 ₱ doz.; do. dark, $2@2.25

The coming celebration of the Jewish Passover forces a demand and with little stock to meet it. Prices are high. The country seems almost drained of market poultry.

Fowls, 16@17c.; roosters, 11@12c.; turkey, hens, 19@20c.; turns, 16@17c; ducks, 75c@$1.37 geese, $1.50@2.50 pigeons, 35@45c. Game is in light supply; but little is wanted as would appear with the decline in snipe choice Red heads ducks 75@90c per pair; other surts 25@35c; Eng; snipe $1.75@3; plover $1-50; sand 50c.

PROVISIONS.—Hog products have been active and closed strong at an advance.

Mess pork closed at $16.75@17 for new mess on the spot, $16.85@16 95 for April, and $17 for May. Bacon at 8¾ for long clear and 8.80 for short clear. Beef hams at $21@22. Beef at $21@23 for city extra India mess in bbls Tallow at 6¾@6 7-16 for prime. Stearline at 11¾@12. Western steam lard at 11.10@11.12½ for spot lots and, 11.12½ for April, 11,15 for May, and 11.17½@11.20 for June.

Receipts for week, beef, bbls and tcs, 400 pork, bbls. 3,800; cut-meats, pkgs. 12,800; lard: do. 8,57 .

Exports for week, beef, bbls. and tcs., 1,778; pork, do. 3,022; cut-meats, lbs. 6,543,412; lard, do. 2,906,025.

SEED.—Clover is quiet at 8¼@9. Timothy is slow at $2.80@2.90

TOBACCO.—Export demand is fair in both Western leaf and seed leaf and prices rule firm.

WESTERN LEAF.

	Light.	Heavy
Lugs	4¾@ 6	5 @ 6

Yara, first and second cuts, assorted	62½@67½
Yara, cuts	92½@$1

VEGETABLES.—There is a strong market for potatoes and the advance in beans does not hurt them any. Buyers prefer to pay best prices with the assurance of good quality. Most lately arrived bulk lots are consequently dull

Bermuda potatoes $9@10 ₱ bbl.; 2d crop $7@7 75; Early Rose, Nova Scotia d.h. $2.62@2 75. Maine $2 50@2.75, State, $2.25@2 50; do. bulk, $2.25@2 50. Prolino, $2.12@2.25; Mercer, $1.87@2 Jackson White, d.-h., $2@2.25; Burbank, d.-h. $2 50@2 62; do. bulk, $2 25@2.50, Snowflake, $2.25@2 50; do. d.-h. $2.37@2.62, peachblow do. $2.37@2.50 Peerless, $1.75@2; sweet Del. $2,25@2.75—hardly wanted.

Advices indicate that hail storms have seriously damaged Southern green crops; nearly all of the smaller usual shipping points mention some damage and some an entire loss.

Fla. green peas per crate $3@4; Md. do. $4@5; Fla. tomatoes, $1.50@2 ₱ crate; Bermuda tomatoes, 50@60c. ₱ box; Fla. string beans, $4.50@5 ₱ crate; Bermuda beets $2@2.50 ₱ crate; do. onions, $3.25 ₱ crate; Norfolk Spinach, $3@3.50 ₱ bbl.; do. kale, $1 75@2; do. radishes, $2.50@3 ₱ 100 bunches; Chas. asparagus $6@7 ₱ doz. Fla cabbage, $2.50@4 ₱ bbl.; lettuce $2.50@4. per bbl.; old turnips, 50@75c ₱ bbl; cabbages, $4@6 ₱ 100. Hubbard squash, $1 ₱ bbl.; marrow do. 50@75c.; onions, white, bulk, $4@5 ₱ bbl.; other, $3@3.25; carrots, $1@1.25; celery 50c@$1.

WOOL.—The market continues very dull and buyers have the advantage. There is not much prospect of activity until there are negotiations for the new clip. Quotations:

Ohio, Penn, and W. Va, XXX and picklock, 43@45c.; XX, 40@42½c.; X, 40@41c.; No. 1, 45@46c.; No. 2, 38@40c.; common, 34@35c.; fine delaine, 45@45c.; medium combing and dela no. 45@47c.

LIVE STOCK MARKETS.

NEW YORK, Saturday April 9, 1881.

BEEVES.—Receipts for the week 13,015 head; do. last week, 12,389 do. The strong prices of the past sales' days have brought in good supplies. The demand at the close is not so sharp as it was as the weather is warm for carrying; cattle declined with the last free offering. Range for business done at the close 9¼c. to dress 58 lbs, to 11¾ to dress 57 lbs,; the latter rate seldom obtained.

COWS AND CALVES.—Supplies are small and the receipts have met a fairly quick sale at $30@55 per head. Few will come from near points for a while as the milk season for consumption is opening and new butter is stiff in price as well.

VEAL CALVES.—Prices have an easy tone for both live and dressed. The latter must be strictly fresh at this date of Spring.

New Jersey live fed prime 7½@8c; other 6@6½c.; very poor 4@5c.; Mt. Holly, takes the range. Buttermilk, 3@4c.; dressed calves choice 9½c.; other 5@8c.

SHEEP AND LAMBS.—Receipts for week, 18 845 head; do. last week 21,933 do. There has been a weak feeling latterly although receipts are moderate. Sheep sold 6½@7½c, with a few at 7¾c. Exporters have taken a fair portion of the supply. Yearling lambs 6¾@7¾c.; live lambs per head $3@6.

SWINE.—Receipts for the week, 21,198 head: do. last week, 21,935 do. Market firm at $6@6.25 ₱ 100 lbs. Western corn-fed.

Country dressed pork scarce and firm: light, 8¼@8½c.; medium, 8@8¼c.; heavy, 7¾c.; city dressed Western, 7½@7¾c. Pork tenderoins, 11¾@12c.

Clergymen, Lawyers, Editors, Bankers and Ladies need Hop Bitters daily, for nerve force.

FARMING FOR BOYS AND GIRLS—NO. 18.

HENRY STEWART.

The Growing of Crops.

ALL the laborious preparation of the soil by means of draining, plowing, harrowing and manuring is but the first part of the farmer's work. These are all mechanical work; that is, they are done by the hand, or by tools, or machines; yet each one depends upon some settled principle, and must be done in the right manner and consistent with each principle upon which it is based, or it will fail and all the labor be lost. Knowledge of what should be done, and skill and practice to do it, are needed, but nothing more when the work is done, all is done that can be done, and there is no uncertain element which can enter in to prevent the certain effect of the work.

But when the farmer sows his seed he is met at once by the greatest uncertainties. The weather then becomes the farmer's master, and under its influence a man is helpless. Frost may blast the tender corn, just appearing with its green shoot above the soil; drouth may parch the earth and destroy the growing plant; sweeping rains may beat the crops to the ground; fierce winds may lay low the corn or the wheat; the fog may brood over the field until the hot sun overcomes it and chases it away, and then, scorching the wheat, may cause it to rust and wither and destroy all the farmer's hope for a return for his long-continued labors. From the time that the seed is sown until the harvest is safe in the barn, there is nothing but uncertainty as to the result.

In addition to the risks from the weather there are dangers from insect enemies, and from injuries by rust and smut and other diseases caused by the growth upon the crops of minute plants known as fungi, which feed and grow upon the sap and so deprive the crops of their proper nutriment. The farmer has need to know of all these things that he may do what he can to avert these dangers and lessen these risks; for when one knows of a danger that may occur, he may take all those means to avoid it which are possible for him. No man can control the weather. This he must take as it comes. But the farmer may prepare himself in many ways for these accidents, so that he may suffer but little from them.

One great safeguard against these risks, is to have one's work done in good season, for it is well known that the late sown crops suffer the most from bad season. Another is to prepare the soil in the best manner; for a crop upon soil that is poor, or has been poorly prepared, is often too weak to recover from an injury that would not damage a crop upon good soil, and that is strong and vigorous. Dry weather is always most hurtful to weak crops, and rarely injures stout and deep rooted plants upon well plowed soil. So too the heavy rains that flood the fields and choke the roots of the plants which cannot thrive in water—where the soil is not drained, rarely do any injury where the land is drained, because the water passes off very quickly through the drains. Again, crops that are strong and are growing rapidly rarely suffer much from insects or from diseases; it is with these as with animals, and even with persons, the strong do not suffer from disease, it is the weak that are always ailing and that cannot resist those accidents which the strong and healthy either escape altogether or by which they are but little troubled.

In all this there are seen the results of what may be called a natural law; by which is meant something which always produces certain results, as for instance, that wrong doing is always punished in some way or at some time; that water quenches fire or that fire burns. These results being absolutely certain, we term such cause and effect a natural law. And the natural law which is here involved is this, that work well-done always produces better results than work ill-done. To do work badly, in wrong season or in a poor manner, is wrong doing; it is not dealing justly to those we work for; it may be ourselves for whom we work, or it may be for another person; the act is precisely the same in effect; and being unjust is wrong and punishment always follows. It does not matter that it was not intended or that it was done through ignorance; the intent or want of knowledge is never regared so far as a law of nature is concerned and the farmer who breaks the law here referred to, always suffers, although he might not know or expect what would be the result. We find this out as we grow older, and this knowledge is experience; and "Experience," we are told "keeps a dear school;" because those who learn only by experience always learn by suffering.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK AND COUSINS:—Not seeing any letters from this part of the country, I will ask to be admitted to your interesting Club. I am 13 years old, and live on a farm with my uncle, G. W. Henry. He has taken the RURAL for some time, and we like it very much. My uncle has a farm of 305½ acres. He raises cotton, corn and oats. He has five head of horses and mules, two Indian ponies, which we ride, and 46 milch cows. I have learned to be a real good dairy maid. I was brought up in New Orleans, La., and San Antonio, Texas, and last year was my first year on a farm. I would not exchange our ponies and our beautiful farm for all the cities in the South. I was always a pale, delicate girl, but now I weigh 100 pounds. I had a small garden last year, but did not raise seed because it was not genuine. I hope you will be so kind as to send me some.

BOWKER'S
HILL AND DRILL
PHOSPHATE

SEND FOR PAMPHLET.

This is a true bone superphosphate, and may be used *on any crop*, in the hill or drill or broadcast, either *with* or *without* manure, and will produce a much earlier and larger crop. In the Report of the Mass. Inspector of Fertilizers, its valuation is from $3 to $10 per ton higher than other Phosphates which sell at the same price. The past year over 5000 tons were sold against 100 tons three years ago, showing that it is liked by the farmers. If there is no local agent near you, send to us.

Also for sale STOCKBRIDGE MANURES.

BOWKER FERTILIZER CO.
BOSTON & NEW YORK

STOCKBRIDGE
MANURES

SEND FOR PAMPHLET.

These manures are the richest fertilizers now manufactured, and the best substitute for, and costing *much less* than guano, which is now practically out of the market. Unlike guano, they *are not stimulants* and *exhaustive*, but *permanent* and *lasting*, being composed of bone, potash, etc. You can draw at one load enough for 3 to 5 acres, or as much plant-food as is contained in 20 loads of ordinary straw manure. Corn, potatoes, hay, etc., are bringing such good prices that it will pay to use the Stockbridge extensively. If there is no local agent near you, send to us.

The Ladies of the White House

AGENTS WANTED for "The Ladies of the White House or in the Homes of the Presidents," the most interesting book of WASHINGTON LIFE ever published. A History of every Administration from WASHINGTON to the present time. Includes much Personal and Private history never before published. Address BRADLEY & CO., 66 N. Fourth St., Phila., Pa.

☞Our new edition contains portrait and sketch of MRS. GARFIELD.

PERSONAL ITEMS.

Mr. Ashmead Coutts-Bartlett has written to friends denying that he expects to visit this country with his bride. They have no intention of coming to America at present.

Kossuth, who is now 79 years old, enjoys good health. He has a very pleasant villa near Turin, surrounded by a handsome garden, which he planted himself and cultivates with the greatest care.

Mrs. Garfield, who speaks French and German fluently, is said to be the first President's wife able to talk with foreign diplomats in the court language of Europe. Her husband is also accomplished in German and French.

Miss Frances E. Willard of Chicago, who has been, at Washington, the leading speaking spirit in the presentation and unveiling of the painting of Mrs. Hayes, presented to the White House by the Women's National Christian Temperance Union and the Mrs. Hayes Memorial Committee, has started on a tour through the Southern States Before going she and Miss Ransom, the artist, lunched with President and Mrs. Garfield.

[Mondovi, (Wis) Buffalo Co. Herald.]

Notions of the First Settlers.

Mr. W. H. H. Amidon, one of the first settlers in the town of Gilmantown, Wis., and one of the most industrious and hard working men in the country, has been very severely troubled with rheumatic pains during the past few years, so much at times, that he was disabled from performing manual labor. Learning of the wonderful cures effected by the use of St. Jacobs Oil he procured a few bottles and experienced immediate relief. Many others of our acquaintances have used it and express themselves as highly gratified with the relief it has afforded them. This king of medicines can be bought everywhere.

Miscellaneous.

CARPETS.

We have now open for inspection and for sale a line of the choicest CARPETS ever offered in New York, of the latest and most desirable colorings and patterns.

WILTON CARPETS at $2.25, full five-frame, and equal in quality to anything offered in this market at $2.75 or $3 per yard.

Poverty of the Blood.

If the blood be thin and watery the whole system is impoverished. The flesh is flabby, and the muscles lack hardness, the nerves are relaxed, the internal organs but imperfectly perform their functions, the brain is inert, and in short, the entire body is only half alive. The stomach is mainly responsible for this wretched condition of the humachine. Stimulate and tone that organ with Hostetter's Stomach Bitters, and a marked change for the better will soon be apparent. The result of improving the digestion with this potent and genial tonic will be the conversion of the food into rich, pure blood, and as the blood is the raw material from which flesh, muscle, brain, bone, and every membrane, tissue and ligament of the body are manufactured, all these components of the material frame will be gradually regenerated and invigorated. This is sound doctrine, and is sustained by the logic of facts.

ESTEY

THE ESTEY ORGAN through its intrinsic merit has won a wide popularity. It is universally known as combining sweetness and power of tone, skilled and thorough mechanism, new and elegant designs.

VOL. XL. No. 17. WHOLE No. 1630. | NEW YORK, APRIL 23, 1881. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Biographical.

CHARLES M. HOVEY.

BY WILLIAM FALCONER.

MR. CHARLES M. HOVEY, of Boston, or Cambridge rather, needs no introduction to American florists and pomologists, and but little to those of the Old World, as his long, devoted, useful and forcible labors in horticulture have secured for him a respected, an honored name abroad as well as at home. His life has been an exceedingly active and laborious one, but love of his calling, indomitable perseverance and vigorous intellect have borne him successfully through the turmoil of business and literary work, till now, although in his 71st year, he is still hale and hearty, lithe and active.

He was born on the 26th of October, 1810, at Cambridgeport, where his father was a merchant. His taste for horticulture was an inborn one. When but 15 years of age he began gardening for pleasure, his father's ample yard affording him room enough for his gratification. When between 16 and 17 he had gathered together a goodly collection of hyacinths, tulips, ranunculuses and other bulbs and plants, and with borrowed tools built a small green-house. In this work he was assisted by his elder brother, who is still associated with him. And thus by love and application they proceeded and succeeded in their work, and by economy, exchange and purchase increased the variety of their stock till they laid the foundation of a famous commercial business. In 1834, in addition to their nursery at the 'Port, they went into the seed business in Boston, and have ever since continued to conduct both. Under the name of Hovey & Co., Mr. Charles M. Hovey manages the nurseries and his brother, P. Brown Hovey, and nephew, John C. Hovey, the seed business.

In 1840 the present nursery ground in East Cambridge was bought; it was then a 40-acre piece of wild woodland. The woods were cleared; it was cut up into squares and avenued with pear and other trees, and extensive green-houses were erected. Until this time the cultivation and improvement of green-house and hardy ornamental plants chiefly occupied his attention, but with greater convenience and enthusiasm fruit trees and ornamental trees came in for a vigorous share. Fired by an ambitious and progressive nature, love of his avocation as well as commercial enterprise, he visited Europe in 1844, and bought in the English, Scotch, French and Belgian nurseries such ornamental trees and shrubs—two or more of a kind—as he thought would be hardy and of use in New England. About 20 per cent. perished in their passage hither; 50 per cent. of the whole succumbed within a year or two, and of the remainder a goodly number, proving unworthy of cultivation, were rooted out and destroyed; but of the collection then begun there are in their nurseries now some 175 specimens from 10 feet to 60 feet in hight.

During his whole career the hybridization of plants has been a favorite work, and by this means he has secured some very fine results, especially among camellias. He began the hybridization of camellias in 1835. For the pistillate parent he used Waratah, which has red, cockade-like flowers, and for the staminate ones such of the best doubles as he could get pollen from. All of the first lot of seedlings showed imperfect flower centers, but there was one among them of good form and whose petals were beautifully rounded without any of the characteristic indention of the end; therefore this one was selected as a pistillate parent and the others were discarded; the staminate plants as before were the best doubles. From this second crossing were obtained all of Hovey's fine camellias that have lately figured so conspicuously in America and Europe. Among them are Mrs. Anne Marie Hovey, white, striped and blush-pink, and for which a first-class certificate was awarded by the London (Eng.) Royal Hort. Society in 1879, and a Prospective Prize of $60, by the Mass. Hort. Society, also in 1879; C. H. Hovey, almost the color of a General Jacqueminot Rose and for which was awarded a first-class certificate by the L. R. H. S., and C. M. Hovey, scarlet, not unlike the color of the bracts of Poinsettia pulcherrima, and for which the Mass. Hort. Society awarded its large gold medal in 1854. The above mentioned awards are the highest honors conferred by the Mass. Hort. Society. In the Spring of 1879, with true American enterprise, Mr. Hovey shipped a large lot of their camellias to England, himself accompanying them. They were then bursting into blossom. He exhibited them in London, their superlative excellence overcame English prejudice, the people appreciated them and bought them readily.

In 1838 he hybridized some Indian azaleas and from the seeds raised America, Suzette, Alba crispiflora and others. In 1845 he began the hybridization of Japanese lilies, and as the result secured Melpomene, Terpsichore, Thalia, Polyhymnia, Clio and others, all pretty forms of L. speciosum. Many fine sorts of the leading "florists'" flowers, as verbenas, phloxes, pelargoniums, pansies, carnations and the like were also raised in this way, but most of them are now out of date. But pelargoniums, Cambridge Pet, Dolly Dutton and Commodore Nutt are still favorites in the community. Epiphyllum, C. M. Hovey, glowing violet and red, is also a hybrid raised by Mr. Hovey.

In 1833 by hybridization he secured the strawberry seeds from which, in the following year, he raised Boston Pine and Hovey's Seedling, the last named still one of the finest strawberries. After several years' trial the Mass. Hort. Society awarded it a prize valued at $50. From the time it was first exhibited for 20 consecutive years it was awarded the first prize for the best two quarts of any kind of strawberry; and later, in 1877 and '80, for the best four quarts. In 1855 he raised the Hovey Cherry from seed; Mr. Downing refers to it as "vigorous, productive, very good."

He, representing the firm, has also introduced the Sheldon, Dana's Hovey and other pears. In 1844 he began to make a collection of all the kinds of cherry, plum, peach, apple and pear trees to be obtained, numbering over 1,500 and which were fruited and proved and many of them described in the Magazine of Horticulture. In 1860 he raised Thuja Hoveyi from seed, and five years later a variegated leaved form of Magnolia acuminata.

In 1835, when but a little over 24 years of age, he founded the Magazine of Horticulture and was its editor for 34 years—the whole period of its existence. The volumes of this magazine are a healthy, wealthy mine of horticultural literature and embody full reports of the exhibitions and proceedings of the Mass. Hort. Society, the merits and demerits of the various fruits and flowers grown at the Cambridge nurseries, together with a vast amount of other gardening matter. As books of reference to the gardener who desires to be conversant with his business in its broad sense, this magazine is of great value; its complete indexes are an excellent feature.

In 1848 he began the publication of the Fruits of America, of which two volumes and three numbers—in all 27 numbers—were issued. This is a beautiful work; each number contains four colored plates of fruits, together with wood-cuts of the trees, sketches from life. These wood-cuts are claimed to be exact copies of the trees, and in order to have them positively correct, Mr. Hovey, not only made the sketches himself, but also drew most of them on the blocks. It is much to be regretted that the spirit, energy and talent that began such an exhaustless work could not find it convenient to continue it.

For the past 48 years Mr. Hovey has been an active member of the Mass. Horticultural Society, and president of the same in 1853–1856 inclusive. It was during his administration that the present Horticultural Hall, so spacious and magnificent and so centrally situated, was erected, and great credit is due him for the untiring energy he displayed in riveting the influence required to build this edifice. At page 169 of the history of the society (published last year) we find: "The more cautious members of the society were doubtful of the expediency of building at the time this enterprise was undertaken; but the perseverance and determination of the president of the society and chairman of the Building Committee, Charles M. Hovey, triumphed over every hindrance, and carried the work on to success." And thus the committee "had been enabled to secure for the society a beautiful granite structure throughout for the sum of $104 630"

Mr. Hovey is in himself a horticultural encyclopedia. No matter what branch of horticulture is advanced, he is familiar with it, its nature and its history. His long and close practical experience, together with his retentive memory, apt expression, lucidity and frankness renders him an agreeable companion, a fact instilling teacher, a man with whom time is never lost, but, on the contrary, always well and profitably spent. In a letter I had the other day from Mr. Robinson, the editor of the London (Eng.) Garden, he speaks of Mr. Hovey: "What a wonderfully strong captain Hovey is after so many of those hard Winters and hot Summers! He knows a lot about gardening." Indeed I often wish he were a hundred miles or more away instead of being my neighbor, so that in place of these flying little visits, I could enjoy ones of a day or two, and like with my dear old friend, Louis Menand of Albany, in earnest sit us down to talk till one o'clock before we'd think of bed!

CHARLES M. HOVEY.—From a Late Photograph.—Fig. 213.

Farm Topics.

STANDING OF THE ENSILAGE PROCESS IN THE UNITED STATES.

PROFESSOR E. W. STEWART.

[Conclusion.]

HAVING considered the rise and progress of this system in Europe, let us see what progress it is making in this country. Mr. Francis Morris, of Maryland, some five years ago began pitting green corn in the German fashion, and feeding upon ensilage for a short time in Winter some thousand head of cattle. His was green corn ensilage only, and his report was very favorable to its economy. He has continued this practice up to the present, and still gives favorable reports. Perhaps Mr. O B. Potter, of Sing Sing, N. Y., was the first in this country to build a masonry silo; and he began to preserve corn ensilage about 1877, using a covering of earth to compress the ensilage. His ensilage progressed farther in fermentation than is generally approved, but still was found, as he reports, a very economical food for stock. He has since wisely used clover to ensilage with corn so as to furnish a better balanced ration than corn alone, and after some two years' trial gives a favorable report. His earth covering does not so effect-

ually exclude the air as the weighted plank covering.

In 1879 Dr. J. M. Bailey, of Billerica Mass., built the first double silo of concrete masonry, and stored about 125 tons of corn ensilage, which, although somewhat belated in storing, gave him much satisfaction in feeding. His report stimulated inquiry and experiment in the new process.

At the beginning of 1880 this process was much discussed by the agricultural press, and the result was the building of some 50 or more silos in different parts of the country, most of them substantial, and many of them in the most durable form. This was most remarkable progress for a new system to make in a single season. Probably 8,000 tons of corn ensilage were preserved. The reports from these various experiments have been coming in for the last six months, nearly all of them favorable, many of them very enthusiastic, as to its economy and value. Some very extravagant estimates were made as to the tons of corn raised upon an acre, but these estimates were soon reduced to solid fact by the measurement of the compressed contents of the crops in the silos. Forty-six pounds were found to be the weight of a cubic foot of ensilage after compression under 1000 pounds to the square yard, and the content of the silo was easily measured, and thus the yield per acre determined. The yields noted ranged from 20 to 33 tons of green corn per acre. Thirty tons may be considered an excellent yield of green corn. This is equal to about five tons of water-free food, which is nearly five times the average yield of dry food per acre of our ordinary meadows. But it must be noted that the dry food of corn ensilage is not as valuable per weight as that from meadow grasses.

Yet it must be admitted that the success of the silos built in 1880, in the ensilage of green corn has been very remarkable, and has given this new system a respectable standing in American agriculture; but the final verdict upon the system can only be given when it shall be applied practically to the preservation of our meadow grasses and thus prove itself worthy of being considered a system in stock feeding.

Cost of Ensilage.

Mr. August Goffart states that he is able to take the corn growing in a field, cut it, haul it to the silo, run it through the cutter, pack and cover it in the silo, for one franc per ton—a little less than 20 cents. This cannot be done in this country because our labor wages are more than double those in France. What, then, is the whole cost of producing and ensilaging one ton of corn? Whitman & Burrell estimate it at 80 cents per ton. Mr. Avery estimates the cost of harvesting, hauling, running through a cutter, packing in a silo and covering at $200 for 300 tons, or 66 cents per ton. Dr. Tanner, of Orange Co., N. Y. estimates the cost of harvesting and putting in the silo complete 150 tons at 75 cents per ton. Mr. Chaffee, of the same county, who put up ensilage for thirty cows, estimates the whole cost of raising corn and storing in the silo at $2 per ton; and this he considers very cheap feed. The whole cost of raising corn and putting it in the silo has been estimated by some half dozen others at from $1 to $2 per ton. If we take the latter figure as approximating to the real cost, and if we estimate three and one half tons of properly kept ensilage as equal in feeding value to one ton of good hay, then we find it as cheap as hay at $7 per ton in the barn.

But the great advantage to the small farmer in corn ensilage is, that he may produce as much cattle food upon one acre of corn as upon four to six acres in meadow; yet the drawback to this view is, that the meadow produces a complete cattle food, whilst corn is is not a complete food but must be fed with other nitrogenous food to obtain its full value. The conclusion, then, must be, that all the grasses, including corn, supplemented by the clovers and other leguminous plants, must go into the silo together, and these furnish complete rations for the production of meat, milk and wool. The labor bestowed per ton in ensilaging the grasses and grains in the more succulent state, will be even less than for corn, because the former can be more easily cut by the mowing machine and handled by the horse rake and hay loader, or even with the fork.

It is also quite probable that the grasses, in the fit condition for ensilaging, may be put in the silo with less labor than they can be cured and put in the barn.

It should have been mentioned under the head of the silo—that the concrete wall may generally be built for 10 cents or less per cubic foot, and that the silo should cost not much over $1 per ton capacity. The greater digestibility of succulent grass over that of cured hay will certainly be an ample remuneration for this new method of preserving it. It is quite true, however, that by some small German experiments it appears that grass after carefully drying is as digestible as in the succulent condition; but when these experimenters seek to generalize from these few and exceptional cases, founding upon them a general axiom that green food loses none of its digestibility by drying, let us oppose to this the great general fact that cattle grow and fatten rapidly and profitably upon the succulent grasses, but cannot be profitably fattened upon the dried grasses or hay. Our meadows are usually stocked with nearly the same combination of grasses as our pastures, but who would assert that a full ration of the best hay would produce as much milk or lay on as much flesh as the best pasture? Such facts, open to the general observation of all intelligent feeders, are not to be upset by a German experiment upon two sheep!

Ensilage as a Complete Ration.

Conceding that the system of ensilage, which we have described, will preserve the grasses in a comparatively fresh state, how shall this process be applied to general stock feeding, making a complete system by which animals may be grown, yield milk, and be fattened?

Ensilage, as generally discussed in this country, has been used to signify preserved green corn. This single food is quite inadequate to the complex wants of the animal system. It is deficient in albuminoids to nourish the muscular system, and deficient in the phosphates to build the bones. Yet it is a very valuable ingredient in the ration of animals because of the large weight grown upon an acre, and because it is relished by all our farm animals. Some of the grasses and clovers are rich in the elements in which corn is deficient. To make a complete ensilage ration only requires a proper combination of green grasses and clovers with green corn. Corn having the least proportion of albuminoids, can seldom be used for more than half of the ration. In the following table I give some of the most important of the green foods for ensilaging, and give only the water and digestible nutriments in each:

	Water.	Digestible Nutrients. Albuminoids.	Carbohydrates.	Fat.	Nutritive ratio.	Value per 100 pounds.
Maize fermented in silo; average of 11 analyses	82 0	1 00	10 19	0 54	11 4	0 16
Red clover ensilage	79 5	3 06	8 10	1 70	4 0	0 28
Alsike Clover	83 1	1 46	8 21	0 49	3 9	0 20
Winter Vetch	82 1	3 50	6 70	0 45	3 1	0 19
Lucern	75 3	3 50	9 10	0 40	2 9	0 25
Green Rape	87 1	2 00	4 80	0 40	2 2	0 15
Sorghum	77 3	1 60	11 90	0 30	7 4	0 19
Orchard Grass	74 0	3 60	12 47	0 40	5 1	0 24
Fodder Peas	81 0	3 45	7 8	0 40	3 5	0 19
Fodder Oats	81 0	1 70	8 9	0 35	5 8	0 17
Timothy Grass	70 0	2 10	16 0	0 50	8 2	0 28
Hungarian Grass in bloom	72 0	2 64	13 2	0 40	5 2	0 24
Fodder Rye in head	76 1	1 90	12 0	0 40	6 8	0 21
Upland Grass, average	70 0	1 90	14 2	0 50	8 1	0 23

There are many other grasses not given in the above table, that may also be used, and some other leguminous plants, but this table contains all the plants that will usually be chosen for ensilage. Can a proper ration be constructed from them for growing young animals, for fattening animals, for producing milk, and growing wool? No one can doubt that these green foods, properly combined, contain every element in the right proportion for all purposes of stock feeding. Where these grasses are found in perfection in pasture the feeder relies upon them to produce the highest results.

If we examine the table, we find that 100 pounds of green corn would give only one pound of digestible albuminoids. If this were fed to a cow that yielded 30 pounds of milk, it would be insufficient to furnish the caseine and albumen in the milk alone, without yielding anything to supply the waste of the cow's system. The German experimenters think they have shown the necessity of supplying two and a half pounds of albuminoids per day to a cow of 1,000 pounds weight, in milk. This would require 250 pounds of corn ensilage as a daily ration—an impossible ration. But if we take from the table 65 pounds of clover ensilage and 60 pounds of corn ensilage, it will give a complete daily ration for a cow of 1,000 pounds weight, in milk—2 58 pounds albuminoids; 11 37 pounds carbohydrates; 1 4 pound fat. This is a large excess of fat, which will more than make up the deficiency of carbohydrates. I know from experiment that this ration will produce a large flow of milk, having fed it in just this proportion early in September from green corn and second-crop clover, both in excellent condition; but being fed fresh, it contained more water than that given in the table, as that had lost water in the silo. Yet it contained liberal nourishment to produce a full flow of milk. I have fed this combination in several different years and always with complete satisfaction.

Let us examine Red Clover as an ensilage crop. As will be seen by the table, Red Clover is the most nitrogenous of the leguminous grasses there given, except Lucern or Alfalfa, and this latter has not been cultivated to any considerable extent except in California. A full crop of green clover weighs more than most farmers suppose. The writer has fed many acres of Red Clover for soiling, and carefully weighed the product of an acre in different seasons. Ten tons have been found only a good crop in a favorable season, and sometimes 12 tons have been weighed from an acre at the first cutting. Twenty tons may be taken from an acre at three cuttings in the most favorable seasons. And as a ton of clover is worth about two tons of fodder corn, it will be seen that the clover crop may be quite as profitable for ensilage as corn. It can be cut and ensilaged at a less price per ton than corn can be grown and ensilaged. If, then, we estimate the specially raised clover crop to produce 15 tons per acre, this would give a ration of 65 pounds per day for 461 days, and it would take half an acre of good corn to produce the 62 pounds of corn per day—this is equivalent to keeping a 1,000-pound cow on a full ration of clover and corn 308 days from the product of one acre. This would be the full milking season of ten months, and ought to produce an average of 6 000 pounds of milk. In this case the acre produces everything the cow consumes, and this is certainly a cheap production of milk.

The same proportional ration may be combined of Alsike Clover, Orchard Grass, Hungarian Grass, or Winter Vetch and corn, when these shall all be put in the silo. Fodder rye and clover, 50 pounds of each, will furnish a complete ration. One hundred and twenty five pounds of peas and oats ensilaged together, will give a complete ration. So, likewise will 100 pounds of Timothy and Hungarian Grass, or 125 pounds of sorghum and Orchard Grass. The reader will see that an almost endless combination may be made from this table, giving the requisite ingredients for a complete ration.

If, then, it is conceded that these green foods may be preserved in a silo in a fit condition for the production of milk, meat and wool, the farmer may feed stock without the use of grain and thus make his farm self-supporting. In this way the system of ensilage may enable the stock farmer to continue succulent food to his animals throughout the year.

Experience with Ensilage.

I BUILT a silo in September last, 19x10½ feet in the clear, and filled it the last of September with corn when just in the silk, cut with a fodder cutter in half-inch lengths. It was firmly packed by men tramping upon it. When the silo was filled I put on about one foot of rye straw, then two-inch plank crosswise, then about 1,000 pounds of earth to the square yard. It was opened on December 22 and found in splendid condition. The cows eat it with great relish. It increased the flow of milk considerably and the milk was of first-rate quality. I fed about two quarts of meal and bran to one bushel of ensilage per cow, and in the 17 years I have been in the milk business I have never fed anything that gave me as much milk and of so good a quality as this ensilage, or sauer-krant, or swill, as some call it. I have fed almost all kinds of feed, cooked, steamed and raw, wet and dry, but I never have found anything that gave me such good satisfaction as this ensilage. I like it so well that I shall try to put up from 200 to 300 tons the coming season. It is a success beyond a doubt. There have been a great many farmers here to see my silo, and they all think it a good thing, and there will be a good many silos built in the county of Burlington, New Jersey, the coming season. One of my neighbors has built one already 60x20 feet and 15 feet deep. He is keeping 50 cows now and expects to keep 100 instead of his present 50. I am keeping between 30 and 40 head at present, and intend to keep 100 head on the same land that now only supports half that number.

Mount Holly, N. J. JAS. LIPPINCOTT, JR.

PLOWING WITH THREE HORSES ABREAST

THE article on this subject in the RURAL of March 26, with the illustration of evener and double and singletrees for this purpose, from a Virginia correspondent, showing how simply and easily the plowing can be done, leads me to speak of the method now often practiced in the prairie States. A sulky double plow is used, turning two furrows at a time, as wide and deep as may be required. A comfortable seat is attached on top of the plow, and, sitting in this to guide the horses, a lad 15 years old, or a lame or infirm person, can perform the work as well and perfectly as the strongest and most active man. Three and a-half to four acres can be thus easily plowed per day, costing not over one-half as much as to do it with a single plow and pair of horses, requiring a vigorous man to work them. When the soil is heavy, powerful horses must be used, and these are now multiplying with tolerable rapidity among us, owing to the frequent importations during the past ten years of the larger breeds of horses from France, Scotland and England. The produce of these stallions from fair-sized, vigorous, roomy mares give half-bred animals sufficiently powerful for such plowing and other heavy farm and road work. Thus the cost of raising this sort of horses is in reality no more than that of smaller and less powerful ones; for the former, owing to their greater strength and size, can be put to work one year earlier than the latter, and this more than pays for the extra fee for service of the imported stallion and the increased feed requisite to rear them. Similar teams and plows can be as advantageously used in the Eastern States, where the fields are of the size of a few acres and free from rocks and stumps, and not of a too rough and broken surface, although if worked in inclosures of ten acres or more they would be of still greater economy. WESTERNER.

Field Crops.

NOTES FROM THE RURAL FARM.

Our Present Wheat Experiments.

WE are often asked the question what kinds of wheat we would advise friends to sow. We cannot answer such questions even for our own farm, much less for those in various parts of the country about which we know nothing whatever. Until two years ago we accepted Clawson as the most profitable variety we could sow. Its adaptation to a wide extent of country, as well as its hardiness and productiveness, led us to continue its cultivation without a question as to whether it could be improved upon. Since, we have ascertained that there are a number of different kinds which, in so far as can be judged from the test of two seasons, are just as hardy and productive, and which will make a better quality of flour. In order to test the question still more thoroughly we have now growing, as our readers are already aware, about 80 different kinds. This will give us a rare opportunity of crossing those which seem to possess special merits, as well as of determining which are in themselves superior to those which have already been well tested. The results of these experiments will be given in our Special Wheat Number, with engravings to illustrate marked peculiarities. We give below a list of the kinds sown. The areas vary from five acres to mere strips. We propose to distribute among our subscribers trial packets of the most promising kinds as soon as we shall have raised them in sufficient quantities to enable us to do so. It will be seen that in some cases the same variety has been planted more than once. This is either because of a difference in the appearance of the grain, which threw doubt upon all the specimens being correctly named, or because the seed, received from widely separate parts of the country, presented differences the stability of which might thus be ascertained. In other cases the same variety has been sown more than once with a view to throw light upon the question how much seed should be sown to the acre.

List of Wheats Growing at the Rural Farm.

SHUMAKER.—1¾ bushel to acre. Sown Sept. 23.

FULTZO-CLAWSON.—A cross between Fultz and Clawson effected by Mr. Hugh L. Wysor.

FULTZO-CLAWSON.—Cross No. 2. Square ear; four grains to spikelet. Sown Sept. 24 at rate of one bushel to acre. Mr. Wysor deems this the best yielder known.

BENTLEY.—From H. A. Whittemore.

SANDOMIRKA.—From Ohio S. University. Five-eighths of a bushel of seed to acre.

GOLDEN STRAW.—Three and one-eighth bushels to acre.

FULTZO-CLAWSON.—Cross No. 3. Ear pointed; three grains to spikelet.

ZIMMERMANN.—One and four-sevenths bushel per acre. From Missouri College.

B. 1 AND B. 2.—New Zealand. Sown Oct. 10; from B. K. Bliss.

WYSOR'S SQUARE HEAD.—Cross between English Square Head and a variety supposed to be Wick. Sept. 24.

NO NAME.—A bearded wheat found among Silver Chaff. Long ear; three kernels to a spikelet.

MOLD'S WHITE WINTER.—Sown Oct. 7. Selected heads from our crop of 1880.

B. 3, B. 4, B. 5, B. 6, B. 7, B. 8, B. 9.—New Zealand wheats. Sown Oct. 10; one drill each.

MOLD'S WHITE WINTER.—From Isaac Alter, California. FIVE kernels in many spikelets. We counted the kernels of three heads and found 102, 95 and 90 grains, or 287 grains in the three.

FULTZ.—One and three-quarters bushel per acre on low land.

SILVER CHAFF.—About five acres seeded with four quarts of Timothy. This is the field upon which our fine crop of Mold's Ennobled Oats was raised last year. Sown Sept. 23. Oct. 15 the field was covered with the growth. Upon this field, as well as upon two small plots, the "broadcast drill tubes" were used, five of them taking the place of the usual nine drill tubes, so that the strips of grain were as five of the broadcast to four of the old style.

FULTZO-CLAWSON.—No. 1 cross; sown in small plots from one to two and a-quarter bushels per acre.

SHUMAKER.—Sown two and a-half bushels per acre, Sept. 16.

FULTZO CLAWSON.—No. 2 cross; sown one and one-eighth bushel per acre.

OREGON.—From James R. Knight. Two and a-quarter bushels sown per acre Sept. 17.

DEFIANCE.—This was saved from seed twice sown as Winter wheat. Sept. 17.

SONORA.—From Prof. Blount, Colorado. One drill.

GOLDEN GLOBE.—Mediterranean (?). One drill each.

VELVET CHAFF.—From Prof. S. M. Tracy, Mo. Sown Sept. 19, one and five-elevenths bushel per acre.

CHINA TEA, Sherman, White Fife, Minn. Hard Fife, Oregon Club, Hard Australia, Lost Nation, Touzelle, Soft Australian, Chili, White Russia, Odessa, Eldorado, Canada Club, Judkin, Brooks, White Mexican, Improved Fife, Russian, Pringle's Hybrid No. 6, China Spring, Egyptian, Saxon Fife, Dominion, Prussian White, Pringle's Hybrid No. 4, Australian Club, all from Prof. Blount. Small plots of each sown Sept. 18, 19 and 20.

Nursery, Polish, White Rogers, Russian No. 3, Dott, Russian Nos. 10, 12, 2, 8, also from Prof. Tracy.

La Dow, Wyeor's Hybrid, large heads, square at top, Eldorado (apparently different from the other), Black-bearded Centennial, Blount's Hybrid No. 10, between Diehl and Golden Straw.

RURAL WINTER DEFIANCE.—A portrait of this was presented in our Fair Number. It originated from shriveled seed four years ago of Spring Defiance. The seed sown as above was saved only from heads measuring nearly seven inches in length.

RURAL WINTER LOST NATION.—Saved from selected heads of Winter crop of last year. Originally from Spring Lost Nation seeds received from Dr. T. H. Hoskins, of Newport, Vt. Two kernels were planted by hand Oct. 5, one foot apart each way on a plot of about one-fortieth of an acre, so as to admit of cultivation.

RURAL WINTER CHAMPLAIN.—History the same as that of Winter Defiance.

MANGELS, WHAT THEY ARE—HOW RAISED AND STORED.

[In answer to question, page 277.]

COL. F. D. CURTIS.

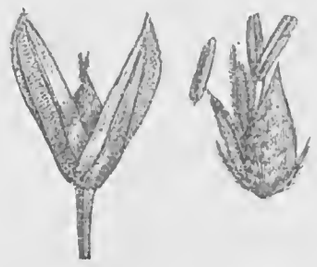
MANGEL, or mangel-wurzel is a German name and means mangel (want), and wurzel (root). [It is also supposed to be a corruption from "mangold" beet, and wurzel, root. EDS.] It is the best root for field culture, not because of its special sweetness—saccharine matter—but because the largest crops can be grown with the least labor. It is not a turnip, although some varieties are turnip-shaped, as the Yellow Globe Mangel. The word turnip is of Saxon origin and means a round root. Some of them are flat-round, and others spherical or globe-shaped, as the Ruta-baga (Brassica campestris) or the Swedish turnip a variety finer-grained, sweeter and smoother. There are two sorts of the latter, white and yellow, the latter, larger and more valuable. Globe Mangels, as the name implies, are round, while the other mangels are long or beet-shaped. They grow out of the ground as the season advances and are easily pulled on this account and come up with very little earth attached to them, while it is necessary to plow out the sugar beets and other small varieties.

The Yellow Globe Mangels grow with a slender tap-root and with a slight push are apt to become detached from the ground, when they will wither and die. This is an objection to them and necessitates considerable care in their culture, after they have attained some size, as even the pressure of the foot will loosen their hold on the soil. The long mangel has a much stronger tap-root and takes a firm hold in the ground. This root is also fed by a number of small rootlets starting out of the sides, which are lifted out of the ground and dry up as the root increases in size, other rootlets growing beneath them and keeping up the means of growth. The tap-root will penetrate down several feet if the soil is mellow, and on this account these roots are not so much affected by drought. A rich surface increases the number of lateral rootlets, and thereby adds to the growth. Mangels, therefore, want a deep soil and a rich surface. A rich surface gives the young plants a vigorous start and, through these rootlets, also helps to make a large growth. Thirty and forty tons are not an excessive yield, and there is no single crop where a greater burden can be taken from the land than of mangels. With proper machinery to sow the seeds and to cultivate the young plants, the hand labor can be reduced to a small percentage. The need of hand labor is the main reason why this crop is not more generally cultivated.

The seed should be so put in that there are no "skips" or vacant places, as it does not pay to transplant to fill these out. Transplanting is a tedious and unsatisfactory process, as the plants will not generally amount to much, especially if the ground is dry and the weather hot. Whenever it is done the large leaves should be twisted off, or the evaporation from them will kill the root before it takes hold in the ground. It is better to fill in "skips" with the seed of Swedish turnips, which may be sowed a month later than mangels and then mature. If mangel seeds are sown with a common seed sower, they should be first "sized," that is, run through a sieve so as to make the seeds at least of three sizes, and the machine should be set accordingly, otherwise they will be more apt to clog in the hopper. Three pounds of seeds are ample for an acre if all are covered and evenly distributed; but, to make sure, it will be better to sow thicker, using five or six pounds. The Germans allow 14 pounds of sugar beets per acre, but the rows are closer together than mangels are grown, and the plants are left thicker in the rows.

Mangel rows should be at least two feet apart and the plants be thinned out to one foot or 16 inches. One beet seed will send up several plants, as the seed is really a burr and contains a number of germs or seeds, according to its size. The seeds ought to be put in from a half inch to an inch deep, according to the dryness of the land at the time of sowing. The best cultivator we know of to work among the young plants has the hind teeth so shaped that they clean away all of the weeds and stir the ground close up to the plants without covering them up. This leaves a space about an inch wide, to be thinned out by hand. A stroke with a hoe across the row cuts out everything except a bunch of plants and weeds where a plant is to be left, and this bunch must be weeded by hand. When once thoroughly done no more hand labor is required except to pull, now and then, in after cultivation, any stray weeds. Cleanness and frequent cultivating are important and will well repay the care.

Mangels should be planted as soon as the ground is in good order in the Spring. In the latitude of Tennessee they may be planted as late as May or the first of June, as the Autumn is later there than in New York. They require a period of about five months to get a full growth and mature. They should be gathered before hard frosts, as freezing makes the crowns soft and injures them, causing rot. As soon as the plants can be seen above ground the cultivator should be run between the rows, and when the beets are two or three inches high they should be thinned out. They should be planted in drills, and the ground may be ridged up or not. When slightly ridged the plants are not so apt to be covered up in cultivating. If the ground is naturally clean—free from weeds—the labor of ridging may be dispensed with. In this case, a marker may be run across the field to mark the rows



SPIKELET OF CANARY GRASS.—FIG. 215.

and clear them of lumps, so that the planting may be better done. The soil should be in good, mellow order. It is a good plan to roll it before marking out and planting.

The roots may be housed in a cellar or kept in the field. When cellar room is not available, a pit four or six feet wide and one foot deep should be prepared in a dry spot by throwing the ground out on each side and leveling the bottom on which the roots may be dumped and piled up for any length, the top being shaped like the roof of a house. The sides of the heap may be carried up a foot or two from the bottom, and the pit covered with straw with a small tile on the top every ten feet to let out the moisture and heat. A covering of earth from six inches to one foot thick should be put on top of the straw and spatted down with a shovel. The roots should be taken out at one end when needed. They should be *perfectly* dry when put into the pit and when covered. They may be pulled in the fore part of the day and the leaves cut off, the roots being thrown into rows with spaces between them to drive a team. They may be picked up by hand and thrown in a wagon or cart, and also thrown into the pit without injury. The slight bruising does not cause them to rot. A wisp of straw should be pushed into the tile to keep the cold out. In severe climates a covering of manure should be put over the earth to prevent freezing. When warm weather comes in the Spring the roots should be taken from the pit and be stored in an outbuilding or they will grow. Mangels can be kept in this way in excellent condition until July. Mangels are worth much more for feeding stock than the chemical tables indicate. They are rated by these tables as 85 per cent. water, with about seven per cent. of sugar. When hogs will fatten on them fed raw, and cattle grow into beef, there must be virtue in water or chemistry fails to appreciate fully the value of these roots.

AMERICAN CANARY GRASS—PHALARIS INTERMEDIA.—FIG. 214.

OATS—CULTURE AND EXPERIMENTS.

PROFESSOR I. P. ROBERTS.

I AM now enabled to give the results of another year's, or what is far more valuable, the average results of five years' experimenting.

It has been my uniform custom to avoid rich ground when experimenting with oats, so as to give the special manures a chance to show their value on our land. The land selected for 1880 was a warm, gravelly soil producing well in a wet season, but Summer crops suffer on this land in a dry time. The average yield of these plots was about one-half as much as our regular field crop. From a measured field of 14 acres and 154 rods we thrashed 1,022 bushels of clean oats weighing 33 pounds to the bushel. In addition to this, a quantity was fed in the sheaf estimated at 75 bushels. Nine pecks of seed of a local variety—Ovid—were sown per acre.

Thick and Thin Seeding. 1880.

Plot No. 8 on the one side, unfertilized	29	17
" 10 " other " "	28	19
Average of the two (No. 8 and No. 10)	29	9

The darker and more moist appearance of the soil of No. 9 led to a determination of the amount of moisture in the first four inches of the soil of this plot and also of that of No. 8. Twenty samples of earth of one quart each were procured, at uniform distances from each other in each plot, by pressing a quart tin fruit can with one end out, into the earth, a thin slide being used to divide the soil within the can from that without. The samples were most thoroughly mixed, each with its own kind, and a sample of each mixture was placed in a glass jar and taken immediately to the laboratory. Two determinations of each sample were made with the following results: No. 8, 11 per cent. water. No. 9, 11 6-10 per cent. water.

Allowing that a cubic yard of earth weighs 3 000 pounds this would give in the first four inches of earth in an acre, as follows:

No. 8, 87 84-100 tons water. No. 9, 93 63-100 tons water.

The samples of earth were taken about two weeks after the grain appeared above ground. The soil on the surface seemed quite dry although the plants had no appearance of suffering for want of moisture. It appears from the above results that either plaster or salt or both have the property of preventing evaporation or of drawing moisture from the atmosphere. They probably perform both offices.

I would call attention to the results of broadcast and drill sowing. I was led to these experiments by noticing that on the clay knolls, especially where the ground was spring-plowed, not more than one-half of the seed appeared to germinate. Notably was this the case where the sowing was early and heavy rains followed soon after. In the Spring of 1877 ten acres were heavily manured and plowed, nearly all of which was heavy clay land, and were planted to corn. In the Fall I ran one furrow, as deeply as two large horses could pull the plow, under each row of corn-stubble, leaving the ground extremely rough and corrugated. In the Spring the surface was very mellow and dried off much earlier than the adjoining ground. It was cross-harrowed to level it; replowed and was easily put in very fine condition. Four bushels of oats per acre were drilled in and we congratulated ourselves that we had broken the backbone of that clay field.

But a heavy rain came three days after; it turned cold and remained so for ten days. In some places I do not think over a quarter of the seed came up. Harvest gave us 40 bushels per acre; we should have had 70 at least, as we harvested over that amount on the adjoining field the previous year. The extreme mellowness of the soil permitted the drill to deposit the seed too deeply. Had it been broadcasted the yield would have been far greater; and in addition, had the sowing been deferred ten days the yield would, without doubt, have exceeded that of the previous year. I got much consolation from the culture of that field—though the yield disappointed me—when I think how much I learned and how nicely that old clay field has behaved since. For the next year we harvested 37 bushels and a few pounds of wheat per acre from it, and late in the Fall of the same year, it was cut with a reaper, leaving the clover stubble about four inches high—sufficient clover had been cured to make about a ton of hay per acre.

So far the experiments in thick and thin seeding have been conducted on moderately poor land; in the future our best land will be selected and in a few years we shall have data for a double comparison. In an article on mangels to follow this, the effect and value of commercial fertilizers will be discussed. It will therefore be unnecessary to treat of them now with reference to the oat crop.

Cornell University, Ithaca, N. Y.

ONION CULTURE.

ONIONS have never proved a very satisfactory crop with me until the past season when I had a splendid crop which I raised in the following way: The soil was a deep, sandy loam, fine and mellow and free from weeds. I used about 10 pounds of phosphate (Crocker's) and a bushel of wood ashes on each square rod of ground and raked in. An essential thing in raising onions is to have the ground rich near the surface. I then marked off the ground and sowed the seed so thick, treading it in with my feet, that when the onions were a foot high they were all matted together in the row. They were then about the size of my little finger. I then thinned them out, leaving them about three inches apart, taking care to pull all that had the appearance of making scallions, which can easily be discerned at this time by their long, thick necks. When the onions were thinned, they dropped over flat on the ground; in fact, I had to be very careful in thinning them or I would have pulled them all up, but they soon straightened up and made a very fine crop. The onions that I pulled I tied up in bunches and sold, so that I lost nothing by using plenty of seed. The seed was the Yellow Danvers sown as early as I could work the ground. This I consider necessary as the crop, to keep well, must ripen in hot weather. For early onions I plant the English Multipliers. One little one makes a big one, and a large one makes a cluster of small ones. These are a very profitable crop, as they are sold in bunches and bring about a cent apiece; and as about 100,000 can be grown upon an acre, and as they do not interfere with a crop of cucumbers that may follow them, the profit is large. I prepare the ground the same as for the black seed onions. I tread these in also after setting them out.

Oneida Co., N. Y. ADELBERT WAKEFIELD.

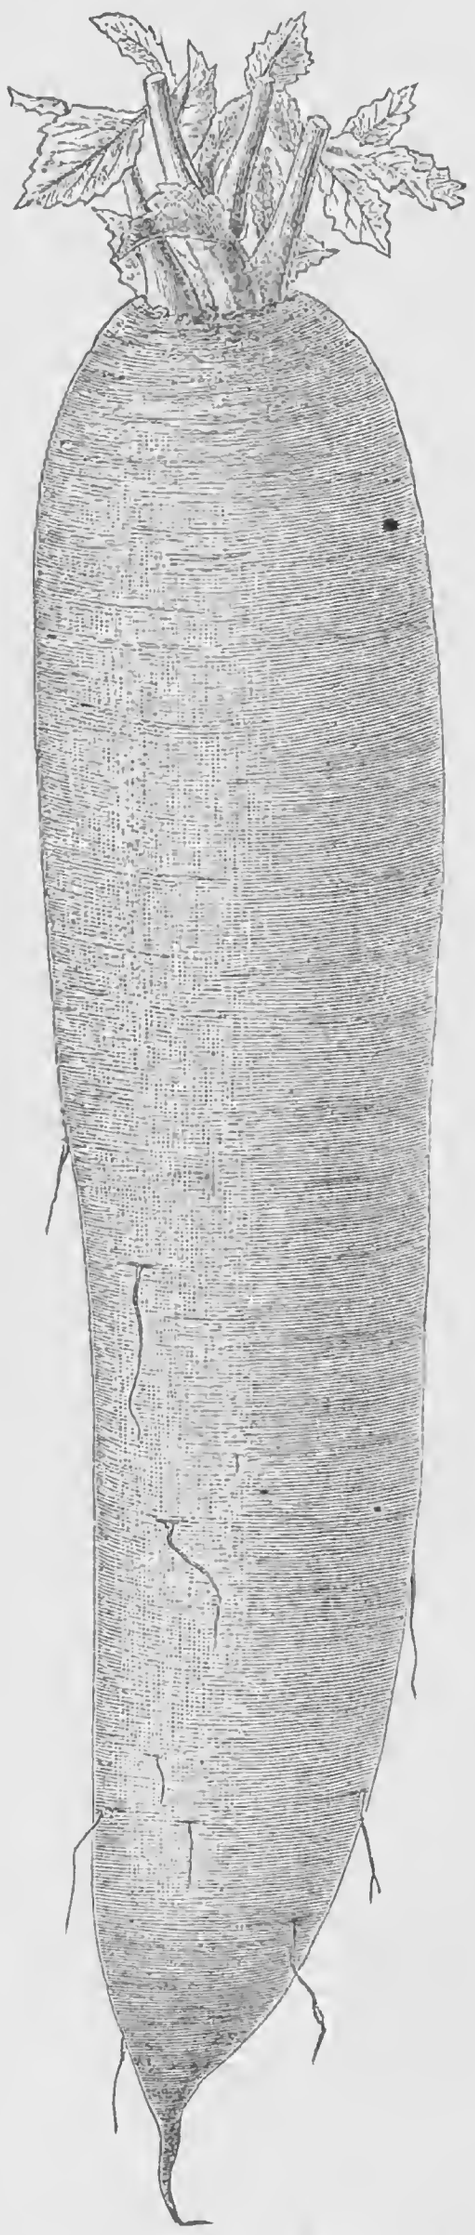
AMERICAN CANARY GRASS.—Phalaris intermedia.—(See page 271.)

There are twenty or more species of this grass, most of which grow in Central Asia. The seed of one species is the annual and well-known canary-seed. The stems of the species now under consideration are from six to twelve inches high; leaves short; spike of flowers thick, an inch and a-half long, all of which are accurately shown in the illustration. It grows in sandy places along the coast in Florida, the Carolinas, Texas, California and other States. It is an annual which has attracted considerable attention in the warmer parts of the United States. Some consider it excellent for Winter pasture. In California its reputation is not so good. It should receive careful study and be the subject for definite experiments. In this way we shall, no doubt, find some grasses which are better for certain purposes and localities than any we now possess. PROFESSOR W. J. BEAL.

TURNIPS.

TURNIPS will grow and flourish on soil that is moderately rich, and produce a better crop than when sown on too rich land. In the latter case the growth is apt to be at the top instead of at the root. For a garden crop turnip seed should be sown in drills about 14 inches apart and the plants be thinned out to about five inches in the drills. To prevent the roots from becoming wormy, dig away the earth to the depth of a half inch or more from the top of the roots and give them a light dressing of wood ashes. In old gardens turnips are almost certain to grow wormy if the earth is allowed to remain upon them.

For the first crop turnips should be sown as early as the ground can be got in order and has become warm, and for the late or main crop sow from the middle of July to the last of August. Ground from which early potatoes have been taken makes a good seed-bed for turnips. Turnips in the field are generally sown broadcast, and then the farmer has no work to do to care for them, and often the yields per acre are as high as 150 to 180 bushels. When we consider the value of this root for feeding purposes we wonder why it is not more extensively grown. Stock will be very grateful in Winter for a root "dessert" of this kind, and will do well on it.



LONG WHITE FRENCH TURNIP.—FIG. 216

Among our best varieties may be mentioned Red-Top Strap-Leaf, White Strap-Leaf Flat, White Egg, Early Purple-Top Munich, White French, and Laing's Rutabaga. Among novelties in foreign markets is the Paris Market or Long White French, which the accompanying engraving (one-half natural size) represents. It is of quick growth, very tender, sweet and juicy. It sells at a high figure in Paris markets, and will probably be offered by our seedsmen another year.

A GOOD SUGGESTION.—A friend writes us from Janesville, Wisconsin, that if the RURAL Sorghum takes kindly to the Western soil and climate it will be a great thing for that State whose dairy interest is fast stepping to a front place, necessitating a good fodder crop for soiling in July and August. He suggests that those who grow the sorghum should weigh the product as it is cut and report the result. We are thankful for this suggestion which we submit to our readers. Those who cut twice or thrice would have to weigh as many times. We take this occasion again to urge it upon our readers to sow this seed on clean land, and not to neglect the young plants, which for several weeks will impress anybody cultivating them for the first time as out-and-out failures—so slow are they to start into luxurious growth.

LANCASTER RED WHEAT.—In answer to an inquiry with regard to this wheat in a late RURAL, a correspondent writes us from Adrian, Michigan, that it is a beautiful red variety, with a long, plump berry. When growing and in good health the straw has a bluish cast, which sometimes gives it the name of Blue Stem. The straw is soft, so that the wheat is liable to fall or lodge, which is its worst fault. It is a good yielder thereabouts, but is being superseded by Fultz and Osborn on account of its tendency to lodge.

WHITE RUSSIAN WHEAT AND OATS.—A friend writes us from Cuba, N. Y., that he has raised the above wheat for four years, having obtained the seed originally from Wisconsin, and that it is in every way a superior variety and fast taking the place of all other Spring wheats in that section. He has also a couple of bushels of the above oats produced from a small packet obtained from Buffalo two years ago. He considers it a tip-top variety and says it neither rusts nor lodges. It stools out well and has very long heads.

Horticultural.

THE TELEPHONE PEA.

I have not noticed any report from any of your subscribers in regard to the Telephone peas included in your Free Seed Distribution. I am somewhat surprised, for if they have generally proved as productive as mine did, considering the treatment they received, I think the pea well worthy of comment.

Right here allow me to say a word in commendation of the RURAL's course in disseminating new and choice varieties of flowers and vegetables among the farmers of our country. I believe that these seed distributions in connection with the reports from the Rural Experiment Grounds are proving of great value to the agricultural interests of the country.

But for the report:—I received a packet containing 17 peas, three of them badly weevil-eaten, the rest to outward appearance being all of them sound and likely to grow. I sowed them rather late in good ordinary garden soil, not very highly manured and without giving them any extra fertilizer besides what the whole garden received. Neither of the weevil-eaten ones came up, and one of the others failed, so there were only 13 that ever started up, and after they were about six inches in hight one of these was accidentally broken off just below the surface of the ground, leaving only 12 to mature seed. From these, besides several pods which were picked off by children while green—some half a dozen pods or more, to my knowledge—I gathered 708 perfect peas, making by measurement three-fourths of a pint or a little more. Most of the pods contained from six to eight large, perfect peas, and a number of them had as many as ten and were a cause of wonder to all who saw them, being so closely crowded together it hardly seemed as if the pods could hold them. If this pea proves equal in quality to what it is in productiveness it is surely a great acquisition. One thing that is greatly in its favor with me is that, although a strong grower, the vine does not grow nearly as tall as the Champion of England. Though this is an excellent pea, it requires such tall brush for support that this requirement is a great objection to it.

Delaware Co., N. J. E. J. BROWNELL.

A GOOD SUGGESTION.—In sowing the new asparagus seed, or any other seed hard to germinate, it is a good plan to sow a few radish seeds among it. They come up soon, are good to mark the rows before the tardy seeds are ready to come up, and the roots are off the ground before they become troublesome.

ANNIE L JACK.

The Apiarian.

TEMPERATURE FOR BROOD-REARING.

G. M. DOOLITTLE.

IN order to rear brood successfully the temperature inside the cluster of bees must be at least 80 deg. Supposing we have a cluster of bees that on a cool morning in the fore part of May occupies three or four spaces between the combs in a full hive containing 2,000 cubic inches, we will usually find brood on two combs only, and but a small amount at that. If these two combs of brood are set close to one side of the hive and by means of the division-board all the bees are shut on these two frames, the queen can and will occupy with eggs two or three times the space that would be occupied in the center of the full-sized hive, and the same number of bees will rear them into brood. As this has been called "Spring fussing" by some, and has been lightly spoken of by others, we have made some experiments in regard to it and will give one of them as an example.

We selected two stocks as nearly equal as possible, both being clustered between six ranges of comb, and we shut one on three combs while the other had the whole hive. Both were treated as nearly alike as possible, and the result was that the one shut on the three frames had each frame full of brood, while at the same time the other had brood in only four frames, to the amount of not over one frameful, or one-third of what the other had. Now, it will be seen that if we put an empty comb in the brood-nest of the hive with three combs, the queen will fill it with brood in a very short time, while if we attempt to increase the brood by the same means with the other, we shall be likely to ruin more or less of the brood already in it. As soon as the bees become crowded for room, the division-board is moved along and empty comb is placed in the center, and this is repeated as fast as the queen fills the combs with brood till the hive is full, which will be long before the one left to itself approaches that condition. This is what is called "building up" in the Spring, or a judicious spreading of the brood. Never spread brood until the bees are crowded for room, for it is only a waste of time, brood and heat. By the above plan double the number of bees will be ready for the honey harvest that would have been if the bees had been left to themselves. This is one of the secrets of successful bee culture.

Another thing to be considered is the size of the frame used. Take, for instance, the large Quinby frame and the Gallup; let a practical bee-keeper manage both and it will soon be found that with the same quantity of bees, and with queens of equal fertility the frame first mentioned cannot be managed so as to have every cell occupied with brood, while the other can. Furthermore, the hive with the small frames can be managed so that double the quantity of bees can go into the fields, while with the large frame they have to stay at home to keep up the necessary heat for brood rearing. With the large frame the bees are spread over too large a surface, while with the small one they are in a more compact and natural form. To illustrate more fully:—Suppose we hive a good swarm in a box nine or ten inches square and five feet high; if the yield of honey is good they will fill it the first season, and if they winter well, so as to consume but little of their stores, we shall find that the bees and brood will be at the bottom while the heat is at the top, and but few bees go to the fields; cut off the top and bring the size of the hive down to 12 inches deep, and double the quantity of brood will be reared and double the number of bees will go into the fields to labor. Again, in the Spring we often want to strengthen a weak colony by inserting a frame of brood from a strong swarm without injuring it, and have the weak stock protect the brood given them. This we can readily do with the small frame, while with the large frame it is much more difficult. If we have a very small swarm we take a frame in which we can see a few young bees gnawing out of the cells; shake all the bees in the small stock on to it, adjust the division-board to the one frame, and in a few days the colony will be strong enough to take an empty frame. This is for ordinary Spring weather, and not when the mercury is 95 deg. in the shade.

Borodino, N. Y.

BEES IN APRIL.

APRIL is a test month for bees, as they are apt to suffer for want of food. The hives which have been in the cellar during the Winter may now be set out on the Summer stands; but the bees should not be allowed to fly much until there are flowers or blossoms of some kind from which they may gather honey. Bees, at this time of the year, consume more honey than is generally supposed, in rearing the brood, hence it is well to feed them, while they cannot aid themselves, by inserting combs filled with honey, which they will gladly remove and the empty cells will be appropriated for brood-rearing. Rye and oat meal should also be supplied as long as the bees will feed upon it.

When the hives are first set out in the Spring it is advisable to take an inventory of each one to see what condition the bees are in, how the new brood is coming on, whether there is any loss of queens, etc., etc. During this examination the weak swarms should be reinforced from the strong, which may be done by inserting, in those which are weak brood-combs from the strong colonies. By having one spare hive to begin with, the entire number may be passed under observation, and the colonies be put in a condition for work. The apiarist

should now be on the lookout for the bee-moth and other enemies to the bee. Every worm or miller killed now will save much trouble later on in the season. Early bloom is necessary if stimulative feeding is not practiced, hence it is well to cultivate the Silver, Red and Soft Maples whose early blossoms afford excellent honey resources for the bees to draw upon in early Spring. Willows and poplars are also early-blooming trees, and among plants and flowers blood-root, liver-leaf, cress, etc., may be mentioned. Bees are industrious workers and every little honey-yielding flower will be visited many times by them in their eager flight, in the days of early Spring.

Arboricultural.

A FEW TREES AND SHRUBS FOR KANSAS.

ADELINE E. STORY.

An Eastern man no sooner becomes the possessor of a piece of land in the comparatively treeless region of the West than he is seized with a sort of mania for tree planting. The information vouchsafed by the older settlers, that his land must first be put under the plow for two or three years, acts as a damper to his ardor—still he plants. The trees dwindle and die, and he plants again. In Northern Kansas his chief reliance hitherto, both as an adornment and a wind-break, has been the Cottonwood, Soft Maple, Box Elder and Black Walnut. The Cottonwood is a coarse, large-growing tree of no particular beauty. Its roots are far-reaching and troublesome, and on this account it should not be planted near orchards or on the lawn where more delicate trees may be set out. Its rapid growth, its ability to grow straight up in spite of all the winds that blow, and the ease with which it is propagated are its principal recommendations. They must be considered weighty ones, as in driving about the country one finds more trees of this kind than of all others put together. If the home grounds are large—as they need be here to allow of trees sufficient to serve as protection against the wind—a variety of large-growing trees, such as the elm, oak, ash, Honey Locust, catalpa, willow, mulberry, Black Walnut, Norway Spruce, Scotch Pine and the different varieties of maples may be planted, not in rows, as is the common practice, but brokenly, thus producing an effect much more pleasing to the eye. Within these, and immediately surrounding the house, smaller trees and shrubs may be distributed, thus preventing too dense a shade thereby endangering the health of the inmates. Some of the good people here so act on the principle—"One cannot get too much of a good thing" that they set out trees to the total exclusion of the sunshine.

Kansas is no particular friend to evergreens. The Norway Spruce, American Arbor-vitæ and several varieties of pine have been found to do well here. The Red Cedar is indigenous and is on that account more often met with, but the dull brown-green of its leaves in Winter, when brightness is most desirable, renders it less attractive than the others.

Of the smaller trees and shrubs known to succeed well may be mentioned Box Elder, (Ash-leaved Maple) Dogwood, Osage Orange, lilac, flowering almond, hibiscus, snowball, sumach and wild gooseberry. The sumach, growing in clumps here and there among the trees, is indeed, a thing of beauty. It adds a brilliant, though by no means tiresome, effect to the whole. This is especially the case in Autumn when the leaves take on a gorgeous coloring of red, while all the others—even the maple which in the East so glows with color—drop their leaves without so much as an effort at brightening up. But what of the wild gooseberry of Kansas? Did any one ever sing its praises as a thing ornamental? Whether or not, it is indeed a beautiful bush, symmetrical in shape, glossy of leaf and dense of foliage. The light-green color of the leaves, affording a pleasing contrast with others of darker hue, makes it very desirable for the lawn.

In this list of trees and shrubs I have thought best to mention only such as have been successfully grown here, the larger portions of them being indigenous to our State. I have been actuated also by a desire to recommend only such as are within the reach of all.

The Japan Retinosporas not Very Hardy.

On looking over the exceedingly interesting Tree and Shrub Number of the Rural, I find the Japan Retinosporas quoted as very hardy. This doubtless is correct in the latitude of New York, but it will not hold good in Wisconsin. I have tested the following: R. plumosa, R. plumosa aurea and squarrosa planted in favorable situations in soil especially prepared for growing and testing the newer kinds of evergreens. Now I find, after a careful test of a few years, that they are tender and will not stand this climate At least the three above-named varieties will not prove a success in the Northwest. I give them up with regret from the fact that where the climate will admit of their healthy growth they are among the most pleasing and graceful of evergreens.

Dodge Co., Wis. C. Perry.

Pomological.

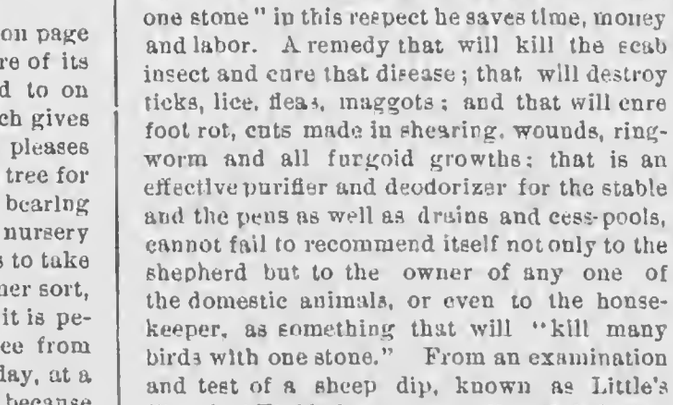
The Swaar Apple.

We find that the apples which are most popular to-day in the New York markets are the Northern Spy, Spitzenberg, Swaar and Baldwin. Of these the Spitzenberg, now as always, is generally preferred and brings the highest price. Next comes the Swaar, of which our engraving represents the average size as they are now sold from street stands. When we consider the immense quantities of this apple that are offered in the markets, both East and West, at this season, we naturally ask where they come from? Where does this excellent apple thrive so well? The question is not easily answered. According to our information, it seems to thrive here and there in isolated localities more than most other apples of fine quality which are raised in large enough quantities to constitute during their season leading market varieties. It thrives moderately well in California, Nebraska, Kansas, Missouri, Illinois, Indiana, Oregon, Michigan, New York and Pennsylvania. This is as far as our information extends.

The color of the Swaar is a rich golden-yellow when ripe. The flesh is yellowish, tender, compact, fine-grained and the flavor is aromatic, perceptibly subacid, rich and agreeable. It ripens through the Winter, keeping well until late Spring.

The Summer Rose Apple, figured on page 21 of the Rural, deserves to have more of its good qualities noted than are referred to on page 20. For, besides the beauty which gives it its name, and the flavor which pleases every one, it has the great merit, in a tree for the house-yard or town garden, of bearing not only regularly, but even from nursery size; and of growing so moderately as to take but little room. Being an early Summer sort, equally good for dessert or kitchen, it is peculiarly convenient as a back-door tree from which fruit can be taken fresh every day, at a season when it is scarce in market, because the early sorts ripening in the heat of Summer, so soon lose their quality and go into decay. It is more reliable, more useful, and handsomer than the Primate. W,

Jonathan Apple.—This succeeds very well over an extensive range of country and remarkably well in Louisiana, Ohio, Indiana, Kansas, Nebraska, Iowa, Illinois, New York, and New Hampshire. Our engraving, from one of medium size, shows the form sufficiently well. It is nearly covered with bright red stripes upon yellow. The flesh is white, juicy sub-acid, aromatic, and fairly rich. The tree is productive and the fruit generally fair. It keeps until Spring.

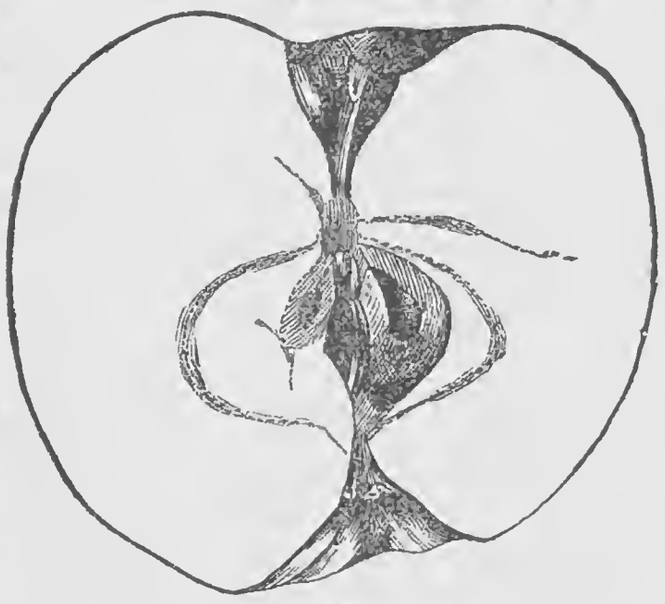


SWAAR.—AVERAGE SIZE AS SEEN ON N. Y. STANDS, APRIL 1.—FIG. 218.

Miscellaneous.

A USEFUL VERMIN DESTROYER.

It was said by an ancient poet who knew what he was talking about, that "sheep are always an unhappy flock." This is very true, for there is no other domestic animal that is so much pestered with vermin, both internally and externally, as a sheep. Let a sheep owner closely examine his flock or call to mind the many troubles with which he has known his sheep to be afflicted. First, there is the scab which fortunately is so much dreaded and is so carefully guarded against that it is now much rarer than it was formerly. But it requires constant watching and preventive measures to avoid this pest. Then there is the sheep tick which prevails everywhere, a ferocious and persistent blood-sucker which worries and torments the poor animals until they lose both flesh and wool. Next comes the bot grub which enters the nostrils and lives in the nasal passages and makes life a burden to both the sheep and the shepherd. Lice, fly maggots and more insect pests might be mentioned.



JONATHAN.—FROM LIFE.—FIG. 217.

Then foot root, both the common and the malignant kind, will recur to the shepherd's memory. There are many remedies that destroy these pests, but some of them are as dangerous to the sheep as to their insect enemies. Mercurial ointment, arsenical preparations, and even tobacco may be classed among these dangerous remedies. If one can "kill two birds with one stone" in this respect he saves time, money and labor. A remedy that will kill the scab insect and cure that disease; that will destroy ticks, lice, fleas, maggots; and that will cure foot rot, cuts made in shearing, wounds, ringworm and all fungoid growths; that is an effective purifier and deodorizer for the stable and the pens as well as drains and cess-pools, cannot fail to recommend itself not only to the shepherd but to the owner of any one of the domestic animals, or even to the housekeeper, as something that will "kill many birds with one stone." From an examination and test of a sheep dip, known as Little's Chemical Fluid, I am very well satisfied that this preparation will do all that is claimed for it. As the season for shearing sheep is approaching, it will commend itself to the shepherds as a tick destroyer and as a preventive of scab and foot diseases, to be used at this season when such an application is most easily and usefully made. For the dairyman it will be useful to free the cows and calves of lice which now increase with amazing rapidity, and to rid the animals of ringworms and warts. Further, as it destroys animal lice most effectively, I don't see why it should not be equally *good* (or *bad*) for plant lice and I am waiting with impatience to test its merits on these pests of my cherry and plum trees.

A Shepherd and Dairyman.

The Champion Hay and Grain Unloader.—In an article on Hay Barns in the Rural of February 5th, Prof. I. P. Roberts, Farm Manager at Cornell University, referred enthusiastically to the great ease and speed with which not only hay, but also short oats, barley, corn-stalks and wheat, bound or unbound, could be unloaded from the wagon and deposited on the mow by means of a hay sling he had found very convenient and efficient. Straightway a large number of inquiries poured in upon him and us as to the manner of its construction, which he fully explained in an illustrated article in the Rural for March 19. Since then we have had a multitude of inquiries as to where it could be obtained, and at length all these questions are answered by an advertisement in this issue. The device has already been so fully described and fittingly praised in our columns that it only remains for us to say that the sling is entitled to the careful inspection of all who may be in need of such a convenience. E. G. B.

Wattled Picket Fence.—In answer to an inquiry about this fence in the Rural of March 19th, a correspondent writes us from Payson, Illinois, that the same sort of fence has been used there for many years, and is rapidly gaining favor. The best pickets are split from good white oak, and these are better than sawed ones. All who wish make the fence without any fear of infringing a patent. Very few plant hedges thereabouts now, as they require too much summer-pruning, and barb-wire fence has had its day in that section.

Restoring the Gnawed Bark on Trees.—In answer to an inquiry on this subject in the Rural of March 26, a correspondent writes to us from Cooperstown, N. Y., that an excellent way to make the bark grow on trees from which it has been peeled or gnawed off is to bind the denuded place with clay, or with mud if clay is not at hand. Thus treated he has found that the bark will grow again without a scar

A Pertinent Question.—I have been watching for some one to advertise, in the Rural, Suffolk or Small Yorkshire pigs for breeding; but have failed to see any such advertised. If any of your readers have them, why don't they advertise? E. M'C.

Sing Sing, N. Y.

What Others Say.

The Proceedings of the Western N. Y. H. S. just received, interesting as they always are, seem more suggestive and instructive than usual. President Barry's address is full of good hints. We make a few extracts. Speaking of artificial manures he quotes from Mr. Harris, who says:—"I have much faith in artificial manures. They will do great things for American agriculture, directly or indirectly. Their general use will lead to a higher system of farming, to better cultivation, more root and fodder crops, improved stock, higher feeding and richer manure." Mr. Barry had learned by experience that to test the value of a fertilizer it must be used on a poor soil where a fair crop, or even a small crop, could not be produced without manure. He had used various kinds of fertilizers on his lawn, in his garden, on trees, etc., but the ground in every case being already rich, he failed to observe the effects of the fertilizers. This is the case with many farm experiments which we hear of as coming to nothing.

Speaking of poor orchard management, Mr. Barry remarked that he had seen trees standing in grass neither broken up nor manured for many years, making a feeble and stunted growth, and producing heavy crops of fruit, one-half or one-fourth of which may be merchantable, the balance hardly worth picking up. We find orchard after orchard in this condition. This will not pay. Trees may kept in a vigorous and healthy condition by proper tillage of the soil, abundance of fertilizers, and judicious pruning. These involve labor and expense, but you cannot grow fine fruit without both, and a good deal of them. A fruit tree shows neglect very quickly. In his pear orchard, to lessen the chances of blight, he slacked off in both cultivation and manure. The result was, in two years one-half his crop was culls. His trees, instead of making stout shoots 12 to 18 inches long, made scarcely any growth at all. He had observed similar results in the case of other fruit trees. In some soils, especially in those of a light and sandy nature, a moderate top-dressing every year is necessary; in others, every second year will be sufficient. There can be no rule laid down. The trees and fruit will tell what is wanted.

The time has come, Mr. Barry thinks, when fine fruits only will pay; the growing of poor fruits is already overdone; the growing of fine fruits will never be overdone. He urged upon orchardists the necessity of thinning as well as of good culture. But when thinning is advised we are promptly told it will not pay; the labor costs too much; it is not practicable on a large scale, etc. The fact seems to be overlooked that it is no more labor to thin the fruits than it is to gather a crop of poor, unmarketable fruits. Thinning at the proper time not only enables the tree to bring the remaining crop to perfection, but gives a quality of fruit that will find a ready sale and fair price any season, and, besides, it saves the tree from exhaustion. As fruit trees grow old they have a tendency

to overhear, and, while good cultivation and careful pruning tend to lessen this difficulty, yet there are few cases where thinning, to a greater or less extent, may not be advantageous. His own practice is to thin twice, or even three times. The earlier the work is commenced after the fruit is well set, the better.

The few growers who send the fruit to market in first-class style reap their reward in fair prices and a good reputation. The California growers and shippers seem to have attained great perfection in packing.

In 1848, just 33 years ago, when ocean voyages were longer than they are now, President Barry took some barrels of Northern Spy and Melon Apples to show our friends in Europe. These varieties were then but recently introduced, and comparatively rare. He distributed them among the leading pomologists in England, France and Belgium, and all declared they were the finest apples they had ever seen. They were sent to New York by rail and made a long ocean voyage—13 or 14 days. They were sent by rail from Liverpool to London, then packed in baskets and sent by express to different places in France and Belgium, and in every case were received in perfect order. He brought some back with him quite sound, in March, although he was 21 days on the water. This shows how easy it is to transport apples long distances, if of fine quality and well packed.

The shipment of American apples to Europe is destined to be immense. But if our growers and shippers desire to secure the best results for themselves and the consumers they will at once determine upon a thorough system of selecting and packing. This applies with equal force to our home markets. Winter pears sent to New York this present Winter, about the holidays, well selected and nicely packed in half-bushel boxes, sold readily at $3 and $4 the box. With less care and taste in selecting and packing, such pears might not have sold for more than $3 or $4 per barrel.

Mr. William C. Barry, of the committee on native fruits, after speaking of the Melon Apple said that another apple equally valuable and nearly as difficult to obtain, is the Jonathan. It is one of those slender-growing sorts which find no favor with nurserymen. But it seemed to him that the people cannot afford to dispense with such a valuable sort. It is of medium size, roundish-ovate form, skin of a light yellow color, nearly covered with light red, deepening to a rich crimson, then to a dark purple; flesh, white, tender, juicy, with a pleasant sub acid flavor; it has all the qualities which constitute a perfect dessert apple. And this, one of our best Winter apples, can hardly be obtained in the market. . . . . For those who are engaged in sedentary pursuits, or who suffer from indigestion, apples of fine quality are invaluable, and they should be used daily in every family, and at every meal in some form or another.

The Amber Queen is claimed by the originator, Mr. N. B. White, Norwood, Mass., to be the richest and best flavored grape ever produced. It is described as a strong grower, with thick leaves, bunch large, amber-colored but growing darker as it becomes riper. Eatable in August and lasts through September.

Speaking of the Niagara, Prentiss, Duchess and Pocklington as promising white grapes, he said that they possess important qualifications which have long been sought in white grapes, such as vigor, hardiness and productiveness. With five fine varieties like the above, and more to come soon, grape growers will surely be able to satisfy a long felt want.

Oleomargarine and the Dairy Interest.—The value of the milk, cheese and butter produced in this country in 1875 was between $45,000,000 and $50 000,000, according to the statement made the other day by F. D. Moulton before the Assembly Committee investigating oleomargarine in this city. Oleomargarine was first introduced surreptitiously, and is now sold by the dark-lantern method. For nearly ten years the dairymen have had to contend with this secret foe. Laws have been evaded and openly violated to damn the reputation of American butter abroad. Last year 28 000,000 pounds of butter and 25 000 000 pounds of oleomargarine were exported. But for the oleomargarine our exports of butter would have been between 50,000,000 and 60,000,000 pounds. England imports $50 000 000 worth of butter annually, and of this $45 000,000 comes from elsewhere than here, giving us only about 10 per cent. of the trade She imports $25 000 000 worth of cheese, and of that, $15,000 000 worth, or about 75 per cent, goes from the United States. We can make better butter and cheaper butter than other nations, and, but for this oleomargarine fraud, we should supply the markets of England.

Mr J. J. Thomas has the following to say, in the Albany Cultivator, about the comparative quality and value of the four new white grapes, Duchess, Pocklington, Prentiss and Niagara. Without having had an opportunity of examining them critically side by side, he would place the Duchess first in quality, a drawback being its one-fourth foreign blood, and the fear that this intermixture may possibly injure the foliage in future. Next in flavor would be the Prentiss, a strictly native sort, of excellent quality, but not equal in this respect to the Duchess. The Niagara, although one notch lower in flavor, is larger, finer in appearance, a prodigious grower and bearer, and, on the whole, has an unusual number of excellent points not found combined in any other variety. The Pocklington is still larger and perhaps more showy than the Niagara, but a notch farther down in quality at the usual time of ripening. It is said, however, that if allowed to hang several weeks it becomes excellent. These four sorts all stand high, and are all eminently worthy of trial.

Professor Johnson gives the following analyses as between New Process Flour from Minnesota Spring wheat, and fine flour from entire wheat W W W brand.

	New Process.	Entire Wheat
Water	12.79	12 89
Ash	0.50	1.44
Albuminoids	12 31	14.12
Crude Fiber	0.07	1 22
Nitrogen-free extract	73.14	68 23
Fat	1.19	2.01
Water free.		
	New Process.	Entire Wheat
Ash	.57	1.65
Albuminoids	14 12	16.20
Crude Fiber	.08	1.39
Nitrogen-free extract	83.86	78.43
Fat	1.37	2.33
	100.00	100.00

The Prairie Farmer takes this view in reference to glucose: "If the farmer, having sold his corn to the highest bidder, has no responsibility in the turning of it into whisky and the sad consequences that follow the use of that article, why should the farmer feel any more concern over the circumstance that his corn is made into glucose, which may or may not contain free sulphuric acid, and which may or may not be used in the adulteration of cane sugar, sirup, and confectionery? With ignorance and prejudice removed, and with commercial processes properly regulated, there is no reason why there should be rivalry between cane sugar and glucose, any more than there is now between tea and coffee, or butter and cheese."

Mr. Chas. A. Green, in the New York Tribune, says that farm bells are manufactured from cheap metal, and such a one as he has just put up on his house-top—without help, in an hour's time—weighs thirty or forty pounds, costs $5, and does not necessarily require a cover. There it swings on cast-iron bearings, connected with the kitchen by a light wire, which passes down the chimney side, without making any hole in the roof. There are several reasons why these bells are desirable on farms. 1. The workmen are often prevented by winds or distance from hearing the dinner-horn or hand-bell. 2. It sounds cheerful and neighborly to hear the bells clang out over the country. 3. By a series of signals previously arranged, either the errand boy, the proprietor, or all hands can be brought to the house in a few moments. 4. In case of fire, or any calamity—in case of tramps making themselves offensive when only the women are present—the bell can call together the whole neighborhood in a few moments. Mr. Green knows of a case where the farm buildings caught fire, and were saved by the prompt alarm of the bell. Such bells, we would add, might be useful in giving an alarm at night, in case of burglars or fire.

London purple.—Professor Johnson says that this cheap substitute for Paris green has been reported to be efficacious as an insecticide. A sample sent by P. M. Augur, Esq., was found to contain 47.3 per cent. of *arsenic acid*. The complete analysis by Professor Collier shows the arsenic acid to be united to lime. The arsenate of lime is sufficiently soluble in water and in the digestive fluids of animals to act as an effective poison. The London-purple may therefore be regarded as fairly the equivalent of Paris-green for destructive purposes.

Seldom is a mistake made in estimating the disposition of those who delight in fine orchards, gardens, rural walks, and the culture of elegant shade trees and shrubbery. A rural residence, tastefully planned and adorned with floral beauties is generally the abode of refinement and intelligence. —O. S. H. S. . . . . Mr. Harris, in the Fruit Recorder, says a strong word for asparagus culture, showing that from a bed of 30 feet square, he has had all his family needed, and sold therefrom $20 per year for the last ten years. . . . . Really, there is no vegetable so overlooked by farmers in general as asparagus, and we hope our present Seed Distribution may help to work a change. . . . .

Mr. Thorne, of the Ohio State University, finds the ash of corn cobs fully as valuable a fertilizer as sulphate of potash. Our farmers, he says in Farm and Fireside, should consider this, as large quantities of this ash are yearly being made by the commercial shipping warehouses of the West, whose engines are fed chiefly, if not altogether, upon corn cobs. . . . . You would save yourself and others a great many useless heartburnings if you would manage to keep your eyes open to the virtues of your friends and look at their faults with your eyes shut. . . . . It is a pretty serious thing to break an old friendship, for, like old china, it can never be made quite whole again. A broken friendship may be soldered but it will always show the crack.

NOTES FROM THE RURAL GROUNDS.

How to Treat the Seeds of the Free Distribution of the Rural New-Yorker.

(Second Publication.)

White Elephant Potato.—We would advise to cut the potato so that there shall be but one eye to a piece and so that each eye shall have as much flesh as possible. These pieces we should plant in rich, loamy soil not less than one foot apart. In case of threatened dry weather, a mulch of leaves, straw or manure would be found serviceable.

Washington Oats.—These had better be sown thinly in drills of prepared soil. Each plant should have plenty of room so as to tiller and to produce the best yield.

The Rural Branching Sorghum.—The R. N.-Y., contrary to its wont, has praised this sorghum almost unqualifiedly as a fodder plant. And our faith is as strong now as at any previous time. We have tested it for three years and the results have been such that we prefer it to any other forage plant which we have ever seen or tried. The early growth of the Branching Sorghum is disheartening. All who try it would, if not cautioned to suspend judgment, consider it a failure one month after it appears above the ground. It then gives no promise of the splendid growth which shortly thereafter takes place. When it attains the hight of five feet, and a half-dozen or more leafy stalks are cut from each seed and every stalk continues to grow as if no interruption had occurred, its real value begins to break upon the cultivator.

It is of the first importance that the prepared plot be free and be kept free of weeds. If otherwise, those unfamiliar with its slow germination and its resemblance to grass, would probably be unable to distinguish the rows. Prepare the soil as for corn—the *mellower* the better. Sow the seeds from one inch to one foot apart in drills four feet apart. Press the soil over the seeds and cover half an inch deep. If sown but one inch apart, the plants at the first hoeing should be thinned out so as to stand not *less* than 18 inches apart. This thick sowing would thus insure an even stand, but where, as in the present case, it is desirable to raise as many plants as possible, the seed supply being very limited, six inches apart might be better, in which case it would be necessary to destroy fewer young plants. Another method is to plant four seeds in a place—a *flat* hill, if the expression is allowable—these hills to be two feet apart, all but one plant to be destroyed at the first cultivation. We advise our friends not to sow before *late May* or even June 1st for this climate. If in late Summer those who raise this sorghum will make the trial of placing equal quantities of this and corn stalks and leaves before their horses or cattle, they will ascertain that the sorghum will be eaten first. For ensilaging purposes we should suppose it would prove far more valuable than corn, while we are in hopes that the sorghum industry may find in this a rival of the several canes now employed for the production of sirup and sugar.

The Argenteuil Asparagus.—Our friends are advised to prepare small plots for this asparagus thoroughly. Select a rich, loamy soil if possible. If not, make it rich by the addition of well-rotted manure. Work it over several times with hoe and spade. Sow the seeds six inches apart in the drills—the drills 12 inches apart. Compact the soil over the seeds and leave the surface smooth and mellow. Let it be borne in mind that asparagus seeds are often *slow* to germinate—requiring sometimes a month or more. Attend to this seed-bed—Keep it free from weeds and the plants may next Spring be set in their permanent beds and cuttings for the table be made the year after.

Giant Dutch Purple Asparagus.—Same instructions in every respect as for the French Argenteuil.

Picotees, Carnations and Chinese Pinks.—These may be sown, as soon as received, in boxes, pans or flower pots. It does not matter so long as a thorough drainage is provided for. Use for this purpose plenty of broken flower pots—or bits of charcoal, or even pebbles or small stones will answer. Fill with rich fibrous soil, such as that from decayed sods, and add a liberal proportion of sand. Mix *thoroughly*. Sow the seeds at least an inch apart (two inches would be better); compact the soil by pressing the bottom of a flower pot upon it and cover to the depth of an eighth of an inch. Again press the soil—but gently and evenly. Place in a temperature as uniform as possible; avoid *hot* sunshine, and cover with panes or pieces of glass. Later these seeds may be sown in the open ground. In this case we would advise sowing in pots or boxes, as above explained, and plunging them in the ground until the rim of the pot is on a level with the surrounding soil, using glass to cover as before. Again, the seeds may be sown in late May in a well prepared, out-of-door border where the plants are to grow. In this case the percentage of loss, of course, will be greater.

We may be excused for insisting that the seeds of this present seed-distribution are worthy of especial care. They are, in so far as we may judge, the best of their kinds. The White Elephant, we believe, will prove as a late potato all that the Beauty of Hebron (previously sent out by the R. N.-Y.) has proven as an early potato. It is now offered for sale but cannot be purchased for less than one dollar per pound. The Rural Branching Sorghum, whatever it may prove in different climates and soils, has cost us $25 per hundred pounds. The asparagus seeds have cost us to import $175 per hundred pounds. The picotees and carnations have cost us to import from $10 per pound (the lowest) to $150 per pound (the highest). In making these distributions it is, as has often been stated before, no part of our plan to offer the seeds in large quantities. Our object is merely to introduce new plants for the farm and garden which (without cost to our readers) give the best promise of proving superior to well-known kinds; and we may call attention to our previous distributions to show that thus far we have been as successful as could reasonably have been expected.

Everywhere.

RURAL SPECIAL REPORTS.

Ga., Atlanta, Fulton Co., March 31.—Our Winter has been long and severe. The season is two weeks later than usual and we are still having frost and cold weather. While I write it is freezing; peaches are nearly through blooming; we are afraid they will be killed, although the young fruit doesn't seem to be injured, it is feared that it is hurt in reality and that it will drop off when half-grown. Farmers have begun to plant corn in spite of the cold weather. Crops are looking well, though some have suffered from the heavy rains which washed some fields considerably. Butter is worth 25c. per pound; eggs, 20c. per dozen; hay $28 per ton. Labor is higher; "hands" that could be got for $8 per month last year now command $12. C. D.

Iowa, Oskaloosa, Mahaska Co., April 2—We have had a very severe Winter commencing about the middle of November. To-day it has been snowing all day; there are many drifts six feet deep at the present writing. Winter wheat has a bad appearance; the top is entirely dead; I speak of my own. It will be two weeks at least before seeding can begin. Hay is scarce at $15 per ton; corn, 25c.; potatoes, 75c.; butter, 20c. We are having a creamery started in our place with a capacity of 500 cows—a new thing for our county. A. B.

Kan., Parsons, Labette Co., April 2—Day before yesterday the temperature was 14 deg. above zero, and yesterday and to-day it is freezing, with violent northwest winds. All reports that the season is not later than usual in these southwestern latitudes are not true. The usual time to herd cattle on the prairies commences on the first of this month. There is not a piece of verdure on them to-day. They are bleak and brown except where burned, and there they are black. It is considered desirable to get all seeds in the ground early, but in 1875 the season was late and grasshoppers also prevented planting till very late and the best corn crop for 10 years was raised that season. It seems to us that the season through will simply be later—that our rains and heat will appear as much later as the season opens late. We have had unusually high March winds and dust enough for common countries. To illustrate the great difference in the climate of Kansas and Iowa, I may state that a grain firm in Iowa has not been able to ship a single carload of corn of the last crop dry enough to inspect No. 2, while not a single car from this place has failed to inspect No. 2 Our wheat crop up to the 31st of March was in an excellent condition, but the weather of the past two days will have been more trying than the previous Winter. Corn here is 28@30c.; wheat, (Winter only raised here) 85c.; oats, 20c.; potatoes, 50c.; butter, 20c.; eggs, 8c.; coal, 13c. for 80 pounds. Not more than five per cent. of Spring plowing has been done. J. E.

Mich., Watson, Allegan Co., March 28.—We have passed through one of the most severe Winters we have had for some time, having had continued sleighing from the middle of November last until last week. It has given business a "boom" that it has not had before in some time. Every wooded nook has been scoured and old logs that had lain for years,

if they were sound, were unearthed and converted into lumber. Consequently every able-bodied man that was not afflicted with the disease known as "constitutional weariness" has been employed, and there has not been enough to "fill the bill" even then. Everything has brought a good price as the demand has been fully up to the supply. All kinds of feed for cattle and horses are scarce and growing more so every day, but we feel in hopes there will be enough to carry us through. Hay now is $14 per ton at the barn; corn, 50c.; oats, 40c.; wheat, $1; potatoes, 65@75c. and in good demand; butter, 20c.; eggs, 12c.; dressed beef, 5½@8c. It has been thawing gradually for a week, and the snow, which according to an estimate of careful observers has fallen to a depth of 18 feet during the Winter, has begun to disappear. Patches of mother earth begin to show themselves, and the bovine race seem to enjoy roaming the fields again. The blue birds, robins and meadow larks have again put in an appearance and we gladly welcome them back, having had enough cold and snow this season to make up for the lack of snow the past two Winters. As near as I can ascertain a part of the peach buds are killed, but fruit-growers think there are enough left for the good of the trees. Some were so loaded with fruit last year that where these were not thinned out the trees were ruined by the breaking of the limbs. The snow is not removed enough yet to permit a general view of the wheat fields, but where there is a partial view wheat looks better than last Fall. I do not remember when we have had so poor a growth in the Fall. There was very little growing weather after wheat was sown. It came up all right, as the ground was moist, but cold weather set in so early its growth was stopped. This is a good maple sugar season thus far, and the product is of most excellent quality. The few "sugar bushes" that remain in this section are now being tapped, and there is a good demand for the sugar at from 10 to 12 cents per pound. This immediate section is mostly adapted to the dairy business—butter and cheese being the chief products. Both have paid well during the past year, and the cheese factories are starting up again, and are being extensively patronized by the farmers. Last year the cheese from the factories in this vicinity was all sold in the cities and villages within a radius of fifty miles, thus showing a good home consumption. The *penchant* for cattle is for pure-bred Short-horns. We have some splendid ones and farmers of very limited means are so alive to the business of improving their stock that breeders are liberally patronized. Of sheep Merinos predominate, although there are occasionally a few small flocks of Cotswolds. Of hogs the Poland-China crossed with the Chester White or some other good breed seems to be the leading sort at present. In the wheat field Clawson takes the lead, although Fultz has given some surprising yields. The only complaints I have heard of the latter is that it is difficult to thrash it clean on account of the small kernels and its being so compact in the head. The leading potato as yet is the Early Rose. This grows so quickly as to get thoroughly ripe and out of the way of the potato beetle sooner than any other that has been introduced here. The cause of the partial failure of the potato crop last year was owing to the protracted wet weather. Where the largest crops grew the year before, viz., on low, mucky land, the crop was an entire failure last season on account of such land being under water a part of the time. H. D. E.

MINN., Zumbrota, Goodhue Co., April 7.—The weather here is fine. The snow has nearly all gone, but the air is rather cold yet; freezing nights. Will not be likely to seed much before April 10. Wheat, 87c.; oats, 30c.; barley, from 40c.@$1; good butter, 16@18c.; eggs, 10c.; lard, 12½c.; pork, 4½@5½c. No heavy floods here this Spring. Snow has departed easily and without rain. Snow is still heavy on the prairies. A great many hands are coming from there now. T. M.

MINN., Stewart, April 4.—We have had a very severe Winter. It set in about the middle of October, and it has not even slacked up yet. To-day it is snowing as if the supply above had not been lessened by former storms. Wheat is worth from 70 to 85c.; oats, 25c. to 30c.; corn, 40c. to 45c.; butter, 15c. to 20c. J. C.

N. Y., Cuba, Allegany Co., April 1.—We are having snug Winter weather yet. Snow fell yesterday and last night to the depth of four inches: fodder is scarce and high. The cheese factories have nearly all commenced operations in this section. E. G. S.

OHIO, Greenwich, Huron Co., April 6th.—We have had and still have a very deep snow, which is badly drifted. The snow commenced coming March 29th and continued to come for five days. I think if it had been level it would not have been less than two feet deep. We have also had some very cold weather for this time of the year. On April 5th the thermometer indicated 8° at five o'clock in the morning. We are afraid the birds will all starve if the snow keeps on much longer. Farmers say this snow is going to be the salvation of wheat, for there has been a great deal of freezing and thawing during the month of March. All that can are making maple sugar and the season has been splendid for it, too. A. B.

WIS., East Troy, Walworth Co., April 7—And still it is Winter. On the 4th and 5th of this month it was four deg. above zero, and it is 16 deg. this morning. There are 18 inches of snow in the woods now, and miles and miles of roads are drifted three to four feet deep from one fence to the other, and the snow is old and hard. The outlook for Spring wheat is not very promising. Farmers are very much discouraged. We cannot tell much about Winter wheat yet, as the ground is nearly all covered with snow. H. A. T.

The Querist.

ANSWERS TO CORRESPONDENTS.

Pears, Quinces and Plums for Northwestern Wisconsin.

W. T. F., Rice Lake, Wis., asks whether there are any sorts of pears, quinces or plums that would stand that climate.

ANSWER BY T. T. LYON PRES. MICHIGAN POM. SOCIETY.

There can hardly be a better reply to this query, than to quote the recommendations of the Wisconsin State Horticultural Society, as found in its Transactions for the year 1878. This Society recommends lists of fruits for "general cultivation" with separate lists "for trials." Of apples, grapes, raspberries, and strawberries, varieties are recommended for general cultivation; but, in the cases of pears and plums, lists are given only for trial, as follows:

PEARS.—Flemish Beauty, Ananas d' Ete, Early Bergamot, Bartlett, Swan's Orange, (This is a synonym of Onondaga) Seckel, Winter Nelis, Clapp's Favorite.

PLUMS. Lombard, Imperial, Egg, Magnum Bonum, Hinckley (or Miner,) Yellow Egg, Eldridge Duane's Purple, De Soto. Of the above, according to Downing, Imperial is a synonym of Red Magnum Bonum; Egg and Magnum Bonum are synonyms of Yellow Egg; while Miner is the leading name and Hinckley the synonym. Very probably the Weaver, a recent native seedling of Iowa, may prove valuable in Wisconsin also. It is highly commended in its native State, especially for its hardiness. The above lists utterly ignore the Quince, which possibly may prove desirable in the southern portion of the State, on suitable soils; but I would not recommend its extensive trial, unless it be after full experience, in similar circumstances. I would doubt its ability to sustain the low temperatures occasionally occurring there; said to be as low as 30° and even 40° below zero.

The fact also that so old a Society, in so old a State as Wisconsin, only recommends lists of pears and plums *for trial*, should doubtless be accepted as a reason for planting but sparingly, and watching critically the results of all known experiments of this kind, with reference to locality, soil and modes of treatment, before venturing upon the extensive planting of this class of orcharding.

So far as plums are concerned, the most promising field for experiment would seem to me to be with our native wild plums (Prunus Americana and Prunus Chicasa), on account of their unquestioned hardiness; a result, very probably, of their exemption from the liability, so general among varieties of the so-called Prunus domestica, or garden plum, to the premature dropping of the foliage; and, as an infallible consequent, the failure to properly mature their young growth; and its death from excessive cold.

The Best Breed of Cows for a Milk Dairy—relative Value of Mangels and Hay, etc.

S. H., Pewaukee, Wis., asks, 1, which is the best breed of cows for a milkman; 2, what is the relative value of mangel-wurzels as compared with good hay or sweet corn fodder; 3, is sweet corn fodder better than common corn fodder; 4, is there any such thing as a hand drill for planting corn fodder.

ANS.—1. Each breed has its merits. If a large yield of milk is desired the Dutch or so-called Holstein is to be preferred, but these cattle are very high-priced and a milkman could not afford to purchase them. Good, well-selected native cows, with Short-horn blood in them are the best in some cases because they give abundant and good-looking milk and when the milk falls they are easily fatted. No milkman can afford to raise calves unless he has cheap land and plenty of pasture. If he has these he had better keep Ayrshires; or at least select the best native cows, get a pure Ayrshire bull from a good milking strain and raise half-breeds. So far as regards the cost of milk, the Ayrshires, according to their special advocates, take the palm over all other breeds, as they are easily fed and milk freely. 2. Careful experiments made by Prof. Sanborn, of the New Hampshire Agricultural College, show that for growing stock one pound of good hay is equivalent to six pounds of mangels, crediting the mangels with the extra growth made by the animals and the amount of hay saved in their feed when the roots were added to their normal ration. This may be taken to represent their practical value when given as excess food in common practice. When in addition to a normal ration of hay, cattle can be induced to eat five pounds more of nice hay, this "excess" food Prof. Sanborn finds will do more than 12 times as many pounds of mangels—that is than 60 pounds of the roots! In feeding milch cows he finds that mangels increase the flow of milk very little, while they injure its quality, the milk of cows fed in part on them giving a smaller percentage of butter, and absolutely a smaller amount per cow. The theoretical value of mangels formerly stood at about one of hay to five or six of mangels, but from practical tests the Professor thinks this low value will have to be cut down. 3 Such analysis as we have do not show any pronounced difference in the value of sweet and common corn fodder; but practically the former is found to be the more desirable. 4. The Fisk Automatic Seed Planter, advertised in this issue, is, we are assured, an excellent implement for this purpose.

How to Build a Hog House.

W. H. B., Afton, Ia., asks how to build a hog-house for say, 50 hogs.

ANS.—A large number of hogs will not do well if fed in one body. The strong ones will fight the weaker and drive them from the feed. Ten hogs are as many as can be profitably confined together, and these should have a pen at least 15 feet by 20. This would make a building 75 feet long by 20 feet wide for the pens, with a floor-way of at least six feet in front of the pens, making the building 26 feet wide for the pens and room in front of them Movable partitions could be put in so as to divide the feeding pens into smaller ones, making three out of one. This would give a breeding sow a pen five feet wide by twenty feet; or they might be cut up making them smaller by running a partition across the middle, so that they would be five feet by ten. The pens ought not to be any smaller. They should be tight except a small space on the outer side next to the floor through which the liquid manure could run out. In cold weather this could be closed up. The entire building should have a tight floor, so that it could be kept clean and to save the manure. The floor should be high enough above the ground to admit of a free circulation of air—at least one foot above the ground. A yard might be connected with each feeding pen, which would enlarge their capacity and allow more pigs to be kept in the pens, as there would be more room for the pigs to exercise, and less inclination to fight and injure each other. The floor should descend, the backside being at least three inches the lowest. The building need be no higher than eight feet, and might be open to the roof. A floor over-head would make it warmer and furnish handy storage room. The space in front of the pens could be used for the same purpose, and could be made narrower, but it would put the building out of proportion.

Cooked and uncooked Hog Feed, etc.

A. H. M., Marion, Kan., asks, 1, what is the relative value of corn, shorts, and potatoes cooked and raw as food for hogs; 2, how does soaked corn compare with dry corn for the same purpose; 3, what is the comparative value of rye and corn practically as food for hogs.

ANS.—1. When corn or corn meal is cooked its feeding value is increased fully one-third, that is to say, it will be digested and assimilated so much better in the stomach of the animal that the same quantity of meal or grain will make one-third more growth than when it is fed raw. The same is true of shorts. Potatoes are very poor food when fed raw, and will not fatten an animal; but, when cooked, the starch, which is the fattening ingredient, is put in a digestible condition, which is not the case when potatoes are fed raw. 2. Corn is rendered soft and more digestible by being soaked. When eaten without being ground or soaked it is not thoroughly masticated and is not reduced in the stomach to such a state that all its nutriment is absorbed, but it is voided to a considerable extent without any change in its condition, and of course does not increase the growth of the pig as much as when more of its nutriment is absorbed. 3. Rye and corn are about of the same value, pound for pound, as food for pigs.

Potato Planters and Diggers.

"No Name." Doniphan, Neb., asks some information about potato planters and diggers.

ANS.—A potato planter known as True's Potato Planter is in use in this country. It cuts the sets and drops them in a furrow and covers them. This machine has been well spoken of by Dr. Hexamer, a gentleman who grows a large quantity of potatoes and whose judgment is good. The mechanical arrangement of the machine seems to be fairly adapted for its special purpose, and it is used by many of the large potato growers. It is manufactured by Nash & Brother, of College Place, New York City. There are two or three potato diggers on the market. The best of these is that known as Allen's Potato Digger. It is a double-mold-board plow, to which is attached a set of finger-bars or prongs, which separate the potatoes from the soil and leave them for the most part on the surface. It is certainly an improvement on the plow for doing this work.

Grade Bulls.

G. E. N., Afton, N. Y., having seen it stated that in England all neat cattle that can show four top crosses of Short-horn blood are eligible to the Short horn Herd Book, asks why, in that case, a fifteen-sixteenths Jersey bull is not as good for all practical purposes as a thoroughbred for grading up native cows.

ANS.—In the United States animals are not admitted to the Herd Books unless they are thoroughbred. There is too much risk of atavism to the worst ancestor far beyond four crosses, to use grade bulls or allow them to be record d, and in many of the States premiums on grade bulls are not allowed to be offered by the agricultural societies. A bull fifteen-sixteenths is not as good as a thoroughbred even for grading up native cows, for the vice of some inferior ancestor is pretty sure to crop out in the offspring, and when pure-bred Jersey bull calves can be purchased at almost nominal prices, there can be no excuse for experimenting with grades. A grade bull is pretty sure to *degrade* his get, while a pure-bred will elevate his.

Labor-Saving Implements in the Garden.

J. L., Auburndale, Wis., intending to begin the cultivation of quite a large garden, asks whether there are any labor-saving implements the use of which will dispense with hand cultivation in the garden.

ANS.—Spade and other kinds of hand cultivation in gardens should be obsolete, as much so as hand labor in farm work. The plow can be made to do better work than the spade if it is rightly used, and the garden should be laid out so that everything can be planted or sown in rows and the plow and harrow be used everywhere After the plowing and harrowing are done the lighter work may be done by hand machines, of which there is a great variety. First, there are the seed drills, which sow all kinds of seed and cover them and finish the operation usually in a very satisfactory manner. There are also hand cultivators of various kinds, some (as the Planet Jr) which have two wheels and work each side of the drill or row of plants, quite close, and others which work the middles. A most useful garden implement is a hand plow which opens drills, covers them, cultivates the ground on each side, and can be worked between rows eight inches apart. Any of these tools may be used as fast as a man can walk, and is as effective in garden work as the horse cultivator is in field work, as compared with the common hand hoe.

Miscellaneous.

C. K. W., Mount Pleasant, Cass Co., Neb.—The sugar properties of the Rural B. Sorghum have never been tested, that we know of. It is as a forage plant that we so highly commend it. We do not think it will mature seeds with you.

C. A. W., DeKalb, N. Y., asks for a good work on phonography, and where can it be obtained.

ANS.—Munson's Phonography, published by Harper & Bros., Franklin Square, N. Y., price $1.50.

J. M., Kossuth, Iowa, asks where can the seeds of ornamental grasses, Zebra-striped Eulalia, etc., be obtained.

ANS—Alfred Bridgeman, 876 Broadway, N. Y., offers them for sale.

O. A. R., Endicott, Neb, asks where he can obtain Scott's Suburban Homes.

ANS.—From D. Appleton & Co., New York City.

J. G., Green Point, N. Y., asks how green manures should be used for liquid fertilizers.

ANS.—By steeping them in water until the latter is colored perceptibly.

W. F. A., Londonville, N. Y., asks how long Michigan White Cedar shingles last compared with those of pine.

MANY INQUIRERS.—The Hay Sling about which Prof. Roberts has written is now announced in our advertising columns.

THE
Rural New-Yorker.

PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, APRIL 23, 1881

SPECIAL NOTICE TO THE SUBSCRIBERS OF THE RURAL NEW-YORKER.

We have sent our first "Free Seed and Plant Distribution for 1881 to all who have applied up to this date. Those who from any cause have not received it, will please notify us by postal card at once, giving the date of their application as near as may be, so as to aid us in looking it up and protecting ourselves against imposition. We request also that the name and address may be PLAINLY written. The applications of those who have not sent us *their* share of the postage (six cents) have been disregarded. As already repeatedly announced, however, those who have subscribed for the R. N-Y. in connection with the Inter-Ocean, Detroit Free Press, the Pioneer Press, N. Y. World, Globe-Democrat, etc., etc., are not *required* to pay *any* postage, provision having been made for this in the clubbing combinations with the publishers of those journals. Those who purchase the RURAL NEW-YORKER of newsstands or news agents (their names not being on our lists) are not entitled to our Distributions, and whether they pay postage or not, their applications are unavoidably disregarded. We do not SELL our seeds or plants under any circumstances.

BOOMS AND PANICS.—Already the newspaper prophets begin to tell us to look out for another financial crash, either this year or next, "certain." Well, the man who is out of debt, be he merchant, mechanic, or farmer, can sleep even with an approaching panic rumbling in the distance. "Out of debt, out of danger." "Booms" are times of free credit; "panics" are the times when debtors are sued up and sold out. The shrewd financier is a man who can say, with Iago, "either way makes my gain." The honest, cautious business man is the one who keeps off the shrewd financiers track, and is not run over by his panic train. Merchants and manufacturers perhaps cannot always do that. Farmers always can. If you owe anything *pay up*, pay up without delay, *while the times are good.* Utilize the "boom" to make all snug, and then let the panic take care of itself. This is the RURAL'S advice, first, last and all the time, to its readers, East or West, North or South. It is adapted to all parallels and all meridians. Do it!

"STATESMEN."—In the local phraseology of Westmoreland County, England, a man who farms his own land is called a "statesman." What a pity we cannot have a few such statesmen in the American Congress. But then we might if we wanted to. We are not absolutely obliged to send lawyers and professional politicians to represent us in the national assembly. Why do we? Is it for our interest or for the good of the country to take our lawmakers from the class of men who have been wrangling for a month over a few offices in the Senate to the neglect of the public business and at a great expense to the tax payers? Why do the farmers submit to this? Why do any of the industrial classes submit to it? Those who sneer at popular government say it is because there is not patriotism or good sense enough among the "dear people" to put an end to it, and that it will go on from bad to worse until popular government is proved to be a costly and ruinous failure. That is just what it looks like now.

AN INTERNATIONAL COTTON EXHIBITION will open in Atlanta, Georgia, on October 5th and last three months. From the starting of the project last October by Mr. Edward Atkinson, it has been received with much favor, and within two months after the opening of the work a charter was procured and the capital stock of $100,000 was promptly apportioned at Atlanta, New York, Boston, Baltimore, Philadelphia, Norfolk, Richmond and other cities. The scope of the exposition has lately been enlarged and its stock increased to $200.000, of which this city, without a moment's hesitation, contributed $25,000. The exhibits will include every article and process used in the production, manipulation and manufacture of cotton and its fabrics, and the manner of using each will be practically illustrated in field and in factory work. Moreover, there will be auxiliary exhibits in the interest of silk, wool, tobacco, rice, ramie, hemp and other Southern products. As a result of the exhibition we earnestly trust that a new impetus may be given to the industries of the South, encouraged by an increased influx of capital from the North and East.

A VERITABLE CURSE TO THE WORLD.—The rumseller is universally regarded as an injury and a nuisance to society. He takes advantage of human weakness and folly for his own profit, reaped in the suffering of mothers, fathers, wives and children. He cares nothing for all the misery his traffic inflicts. He is a Satan in the flesh. But how does the rumseller differ in his motives, his actions, or their results, from the usurer? Does he not also take advantage of human ignorance, weakness and folly to "make his pile?" Those who wish to enjoy before they have earned, those who dream of great profits from risky speculations, those who know nothing of the devouring hunger of ten per cent.,—these and the unfortunates who have done their best perhaps, and have lost, all go to the usurer for "help." He helps them to get rid of what they have left. One of them lately said to the writer, in reply to the question whether one of his debtors could make anything on the money he had loaned him, "No! I shall have all the d—d fool has got in three years." Keep clear of these fellows, brother farmers.

COST OF AGRICULTURAL LABOR.—From the report of the Statistician of the Agricultural Department it appears that the decline in agricultural wages since '79 has been followed by a slight advance in most places. In the country at large the average has increased from $20.26 per month, without board, to $21.75—or 7.25 per cent. The average price of labor with board is $14.56. In Texas, Minnesota and California wages without board share in the general advance, but with board they are lower than last year, owing to the inconvenience of lodging and feeding hired help in the newer settled sections. The greatest increase has been where agriculture has paid best, as in the States bordering on the Ohio and in some of the Cotton States, where the advance has been six to ten per cent. All kinds of labor are in active demand in the South Atlantic and Gulf States; but there the share system is not working satisfactorily and the freedmen are becoming land-owners, while in Mississippi and Louisiana the "Exodus" has made labor scarce. In the Middle and Eastern States the demand for trustworthy men has increased and so have their wages. In the Northwest skilled labor is chiefly in demand, for almost everybody owns land, and hires help only in harvest time. On the Pacific Coast and in the Territories, except Montana and New Mexico, there is a good demand for labor, while in Kansas the influx of "exodusters" from the South and immigrants from the rest of the country and Europe has nearly satisfied the present demand.

PROHIBITORY LIQUOR LAWS.

THE belief which has long been an "article of faith" among teetotalers, seems to be rapidly gaining converts from the public at large—that the most effectual way of dealing with the liquor question is to treat all intoxicants as poisons and prohibit their manufacture and sale wherever public opinion will support such a measure. The recent agitation on this question in various States is doing much to systematize the work and has created a growing tendency in many of the States to prohibit the sale and manufacture of intoxicating beverages by constitutional amendments, and to restrict the traffic in them as much as possible where public opinion is not yet prepared for extreme measures.

Next to Maine, Kansas has taken the most decisive step by enacting a law prohibiting the importation, manufacture and sale of intoxicating liquors except for medicinal, scientific and mechanical purposes. This bill passed the legislature of that State by a majority of over three-fourths, and in it we believe the moral sentiment of the people is reflected. It is entitled to a fair trial and hearty support.

In Missouri, the Lower House, and in North Carolina both Houses, reported favorably on a similar bill. In Texas the Senate asserts, by a vote of twenty-three to seven, that prohibition is there needed. In Arkansas the popular branch favors it; and in Indiana and Pennsylvania the amendment goes to the people for ratification. Wisconsin's "anti-treating" bill, though severely criticized and just declared inoperative by the courts on account of an error in the text of the bill, was also a step in the right direction, as it struck at the root of a pernicious evil—the custom of social "treating." This widespread agitation means something. It means a growing belief that while "moral suasion" is good as far as it goes, it is not sufficient. It means that the strong arm of the law is to be stretched forth to rescue the actual or prospective drunkard from his downward course, and to punish those who tempt him to degredation and crime while threatening his family with disgrace and penury. The temperance question is to have more weight than it has yet had in national and State legislation and politics.

AN OBJECTIONABLE BILL.

THE Assembly Committee that came to this city to investigate oleomargarine, was supposed to be acting in the interests of the producers and consumers of genuine butter. True, before their arrival here there were some ugly rumors that the outcome would prove that the appointment of the Committee was a cunning advertising trick of the oleomargarine and suine men. A year had passed since that festive party of Congressional junketers had given the stuff a puff, and it was about time to obtain another from some other legislative set of gullible ninompoops. The early labors of the Committee appeared well intentioned and honest, and we gave them due credit therefor; but our suspicions were aroused on learning that they, too, ended their labors by investigating the good cheer spread bounteously before them by the shrewd oleomargarine dealers. There were two obvious ways in which the Committee could pay for their entertainment; first, by making a report favorable to the spurious products and, second, by so framing a bill, founded on the investigation, as to render its passage impossible. The revelations made forbade the former course, and, either foolishly or shrewdly, the latter has been adopted.

The bill prohibits the use of coloring matter in oleomargarine butter and suine cheese and the sale or use by any person whatsoever of any such product in which it has been employed. It requires that every cheese which is not made wholly from pure milk shall be stamped across the center, and that the words "Imitation Cheese" shall be sunk into it in the process of manufacture, and stenciled upon the opposite sides of each cheese and the top and bottom of the containing box. It imposes a fine of not less than $50 or more than $200 or imprisonment for not less than 10 or more than 20 days for every violation of this provision. It makes it obligatory on common councils of cities, boards of trustees of towns, etc., to impose and collect license fees from all manufacturing, selling or dealing in imitation butter or cheese, to wit, from each manufacturer, $3,000 each for every establishment; wholesale dealers, $1,000 for every store or stand; retailers $500 for every ditto, ditto. The license must be kept conspicuously posted under penalty of a fine of $100 for every package of the imitation product kept or imprisonment in the penitentiary or county jail, not exceeding six months. There are also some other provisions of the same Draconian severity.

Does any sensible, practical man believe for a moment that such special legislation can be secured; or that if by some legislative freak the bill is passed its provisions can be enforced? We yield to no one in the earnest desire that our dairy products should be released from underhand competition with spurious imitations and from the evil repute likely to be brought upon them by such imitative frauds, but we insist that the warmest friends of these concoctions could not have framed a bill more to their own interest than the one above outlined.

BREVITIES.

SHOULD we now call butter-crackers oleo-crackers?

INSTRUCTIONS as to the treatment of the RURAL seeds are repeated in this number on page 274.

WANTED—The date and place of meeting of all Agricultural Fairs and Stock Exhibitions in this country for 1881. Secretaries will confer a favor by forwarding the same to P. O Box 3318, New York City, at their earliest convenience.

SUPPOSE, according to the belief we have several times expressed, that it turns out that the Black-bearded Centennial and Golden Grains Wheats are the same—what then? It will prove rather queer actions on the part of certain people

IN the United States, in the year 1879, 220,000,000 gallons of petroleum were consumed. With the exception of cotton, petroleum is the most valuable export of this country China and the East Indies alone took nearly 25,000,000 gallons in 1878.

"GALVANIZED" butter is the fraud which our neighbors of the Dominion are putting in competition with our "tallow" butter. The stuff is mainly composed of the poorest kind of lard or fat of any sort, thinly plastered over with excellent butter. Next!

It may be well to remember that as each female potato beetle is capable of laying about 1,000 eggs (so say entomologists), it is a matter of considerable importance that those which have passed the Winter in the ground and appear in the Spring should be as nearly exterminated as possible.

WE desire to send premiums, as promised, to those whose names appeared in the list of mangel cultivators, in the RURAL of Feb. 26; but only a part have sent us their addresses. Will the following persons please do so at once? Jasper Barnes, T. Leete, W. L. Day, W. Moore, J. L. Scott, L. Singer, B. P. Moore, W. H. Harter.

MICHIGAN has a local law requiring the immediate cutting down and burning of peach trees that show the slightest signs of the yellows. Inasmuch as we are strong advocates of the slaughter of infected cattle to prevent the spread of pleuro-pneumonia by contagion, we also wish, on the same principle, that this Michigan law with regard to peaches should be made general, to help to stamp out the yellows.

THE Late Snowflake Potato has received extravagant praise from many quarters. That it is of handsome appearance; that it is in quality, shape and size all that can be desired in a potato may be conceded. Under favorable circumstances, however, it has at the Rural Farm produced so small a yield as not to pay for the expense of its cultivation. Of over 60 different kinds tested last year this yielded the least. The vines were luxuriant and grew on without a check during the entire season.

VERMONT has a stringent law regulating the sale of bogus butter under its proper name; and a conspiracy of rascals now affords an opportunity for its vigorous enforcement at St. Albans. In that lively town resides a butter buyer who ordered from Boston a supply of oleomargarine and sent it out among neighboring farmers of the same fraudulent type. By them it was promptly returned as Winter-made dairy butter. The original "fraud" then sold it to another butter dealer, by whom it was disposed of to grocers, who finally distributed it among their customers for the usual consideration for prime creamery product. Pity the whipping-post does not stand and the cat-o'-nine-tails flourish in the Green Mountain State!

A CHOICE decoration for a roomy hall or porch is found in some of the rare dwarf evergreens grown in easily handled pots or boxes. If there are three or four, their arrangement can be occasionally varied and so freshened. Such as will endure a touch of frost are best for such a risky exposure Their effect, as the first thing met on entering a house during our dreary Winters, is very agreeable. English ivy, on a wire support, and Skimmia Japonica (flowers and berries fine) endure shade well and prefer it. So does Euonymus radicans. Golden Euonymus prefers light and poor, dry soil. Laurestinus likes damp air. Orange, or myrtle, or myrtle-leafed dwarf orange may be added in moderate weather as a contrast of color and figure.

NOTICES TO OUR SUBSCRIBERS.—Our readers are requested to send us, by postal or otherwise, interesting facts appertaining to agriculture or horticulture, which occur in their practice or of which they become cognizant. Reports of the condition of crops, the best varieties of seeds, fruits, etc., the price of farm produce are also respectfully solicited for our "Everywhere" Department. Sketches of farm helps or contrivances of any kind intended to facilitate farm or horticultural work, will be thankfully received, and if of any general utility will be drawn, engraved and published. In so far as it is possible for us so to do, we shall answer all questions as best we may either by mail or under our own Querist Department.

SALICYLIC acid has been widely recommended for the preservation of food of any sort, and is no doubt largely used for that purpose in this country. It is, therefore, to be regretted that it and its derivatives have been found detrimental to health by the Committee of Public Hygiene of France, who have been conducting a series of experiments with regard to it. They decide that it is dangerous not only because of its direct effect upon the system, but also because it allows the introduction of other unwholesome substances into food. M. Tirard, Minister of Agriculture, has consequently interdicted its use and directed the food inspectors to see that commodities submitted to them are free from it. Inasmuch as it has, from time to time, been recommended in the RURAL for the preservation of canned fruits as well as of fresh meat, dairy products, etc, in hot weather, we we call the attention of our readers to the decision of the French scientists.

ANSWERS TO CORRESPONDENTS.

[Continued from page 273.]

Cotton-seed meal and Corn-meal as Part of a Ration for Milch Cows.

J. M. C., South Jefferson, N. Y., asks, how many pounds of cotton-seed or linseed meal are equal to 100 pounds of corn meal for the production of milk.

ANS.—The practical results of a food will depend upon the combination in which it is fed. In certain combinations corn-meal would prove more valuable than cotton-seed meal, perhaps so with clover hay; but in intelligent farming, cotton-seed meal will prove much the more valuable. By the German standard, one of cotton-seed meal is equivalent to over three of corn-meal. According to this standard the cotton seed would be slightly more valuable than the linseed meal. In combination with corn fodder, cotton-seed meal is found to be decidedly more valuable for milk than corn-meal. As a safe estimate it may be put down as at least 50 per cent. more valuable, and as the difference in the market price is always less, there should be no difficulty in deciding which to purchase. With good hay the difference would be less between the value of cotton-seed and corn meal for milk production; but if the value of the manure is included, it is probably greater. No absolute value in practice can be given until the accompanying food is named. In practice, food values rest with the skill of the feeder in making his daily rations. We would feed cotton-seed and corn-meal mixed added to a corn-fodder and hay ration. Corn meal is a valuable butter food.

Grub-in-the-Head in Sheep, etc.

W. S. H., Labelle, O, asks, 1, for a remedy for grub-in-the-head in sheep: 2, has the Rural Branching Sorghum any saccharine properties.

ANS.—1, This ailment is due to the presence of "bots" in the nasal sinuses or cavities. The "bots" are the larvæ of the sheep gad-fly—œstrus ovis. This fly is a slender, bee-like insect that lays its eggs in the sheep's nostrils in July, August and September. The grub when hatched from the egg crawls up the nostrils, and lodges in the sinuses of the head where it remains feeding upon the mucus secreted by the membranes until the following Spring. In entering the nostrils and leaving them the pests cause much irritation to the sheep. In the proper season the fly should be prevented from depositing its eggs in the sheep's nostrils, which may be done by smearing the nose with tar diluted with grease, butter, glycerine or molasses. This either deters the flies from laying their eggs or destroys the eggs. It would be well also, to plow a few furrows in the pasture, and the sheep will instinctively thrust their noses into the loose soil, and this seems to prevent the young grubs from crawling up the nostrils, as they cannot adhere to the dust, and fall to the ground. When the grubs are crawling down the nostrils early in Spring they may be easily dislodged by blowing tobacco smoke into the nose through a pipe. 2. Yes, but they have not been determined.

Miscellaneous.

J. B. K., West Paulet, Vermont, asks what do we think of northern or eastern Georgia for general farming, that is, for producing oats, corn, potatoes, butter, cheese, etc.

ANS.—We must decline to recommend any particular section for settlement. A man's success in any place depends so much on his own abilities and character and on so many other conditions with which we cannot possibly be acquainted that it would be imprudent in us to give advice in such matters, especially as there is a natural tendency, in case of failure, to lay the blame on some one else. Georgia, however, is certainly not a first-rate place either for dairying or raising Irish potatoes, though Sherman's boys found it a splendid place for sweet potatoes.

J. H. V., Moore's Flat, Cal, asks for some preventive or remedy for green lice on cabbages and turnips.

ANS.—We do not know of any practicable remedy for these pests upon cabbages and turnips. Our friend probably knows that tobacco water will kill them, but the application costs more than it is worth. Before cabbages begin to head Paris green and flour in the proportion of one to 40 may be safely applied. But we do not care to recommend this remedy, open as it is to many serious objections.

L. D., Belmont, Nova Scotia, asks, 1, which is the better device for setting milk—the Ferguson Bureau Creamery, the Cooley Creamery, or the Lincoln Channel Can.

ANS.—There is no choice in either of these methods of setting milk so far as the yield of cream or quality of the butter is concerned. It is simply a matter of convenience and of water and ice supply. The best plan is to investigate each method and then use one's own judgement.

H. H. W., Cohocton, N. Y., asks, 1, if we are personally acquainted with the merits of the Wooster Creamery made by M. D. Chapin, Poultney, Vt., and, 2, if the manufacturer is trustworthy.

ANS.—1, This creamery was on exhibition at the New York State Fair in 1880, and met with favorable commendation from critical judges. 2, So far as our business relations go with Mr. Chapin, we consider him entirely trustworthy.

W. S. H., Oxford, Mich., asks where can Golden Grains or Palestine Mammoth Wheat be obtained.

ANS.—Seed may be purchased of D. M. Ferry & Co., of Detroit, Mich. or J. J. H. Gregory, Marblehead, Mass. We do not advise you to sow it largely.

N. Q. R., Gustavus, Ohio, asks where cions of the Primate Apple can be obtained, and the price per dozen.

ANS.—We find it in the catalogue of Ellwanger and Barry, Rochester, N. Y. Price $2.50 per dozen.

H. L., R. Sub Rosa, Ark., asks whether a specified Boston Tea firm is trustworthy.

ANS.—Yes. Why not send your name in full? Such queries we prefer to answer by mail.

W. H., Thompson Station., Tenn., inquires about the cultivation, etc., of mangel-wurzels

ANS.—See article on this subject under "Field Crops."

J. K., Golconda, Ill., sends flower for name

ANS.—Bird's-foot Violet—Viola pedata.

RURAL BRIEFLETS.

GRAPE-VINE cuttings may now be planted. Let them include two eyes and be from eight inches to one foot long. Cut just beneath the lower eye and an inch above the upper eye. Place them in mellow soil in a slanting position, just so that the upper end is left two inches above the surface soil. *Pack* the *earth closely* about them and cover with straw or litter until frosts are over. . . . . .

GOOSEBERRY and currant cuttings should be treated in the same way. Six inches are long enough for the cuttings. Set them where they are to grow. They will bear the third year. . . . .

THE editor of the Fruit Recorder says:—

What is J. T. Lovett trying to bring to life that old, worthless, defunct sort, the "Crystal White Blackberry," for?

It hasn't a single favorable quality or characteristic. Plant tender, berry bitter and small, and a poor yielder. See what he says in the RURAL NEW-YORKER, and as for the specimen berry there represented, we have grown them years, and have yet to see one two thirds as large as that therein represented. "*Let it rest.*"

This is scarcely just to Mr. Lovett, who wrote what he knew of this berry at our request. On page 19 of the RURAL Mr. Purdy may see a cluster of the berries of life-size, drawn in our office from a branch sent by a friend, which will prove that the *single* specimen he refers to is no larger than the largest of those. Mr. Lovett concludes his remarks as follows:—"While it (Crystal White Blackberry) is strikingly beautiful in fruit and intensely interesting, it will ever be valued more as a curiosity than anything else." . . . . . .

A READER sends us the following:—"Naturally I am interested in the question of ensilage; I cannot help it. I have read somewhat of all that is written, and yet I have not seen the Supreme Court sitting on that case yet. My impression of a Supreme Court is a good herd of cows telling the story through a careful, pains-taking, intelligent observer, and a candid judge whose opinion cannot be bought or sold. I am interested in settling every question connected with agriculture as far as possible, and not the least of the many unsettled questions is that of ensilage." . . . . . .

IT is sometimes said that it is not well to tell all one knows. In this regard the RURAL is perhaps open to criticism, for we are disposed to think that it is always ready to tell *all* it knows, and a captious critic might add, "and more." But we like the policy the longer we follow it, and believe that it tends to inspire the confidence of our readers; and in the management of this journal there is nothing we prize more. It may not be modest for us to publish the following from a late number of the Vermont Watchman. It may be the impulse of vanity; but it speaks the truth, and that sort of modesty which is incompatible with truth is, as a matter of fact, a silly affectation and an incipient fraud. Here's the article, and our thanks are due to the writer thereof:—

"The RURAL NEW-YORKER is managed on too liberal principles for some people to understand. The present publisher, having a fortune behind him and great zeal for the progress of intelligent farming and horticulture, has doubled the value of his paper by employing and liberally paying the best writers, draughtsmen and engravers he can find. He has reduced the subscription price from $2 50 to $2 a year. He makes annually gratuitous distributions of rare and promising new varieties of seeds and plants (a work the United States Department of Agriculture assumes to do, but does not do so well). He distinctly announces that these distributions are in no sense premiums, but voluntary gifts, made at his own option and in his own way and time. This is repeated in nearly every issue of the paper. Yet he finds among his subscribers those who insist on these presents being sent as soon as they subscribe, saying that they 'subscribed to get the seeds.' We don't wonder that the editor feels affronted, says he doesn't want such people's subscriptions, and advises them to wait two or three years until his choice novelties are for sale by the seedsmen and nurserymen. These presents are valuable, but the subscriber who has the bad taste to say to the giver that he esteems them above his splendid weekly, deserves to be snubbed." . . . . . .

BOOKS, CATALOGUES, ETC.

EVERETT & GLEASON, 34 South Market St., Boston, Mass. A very neat and comprehensive catalogue and retail price-list of vegetable and flower seeds, herb, tree and grass seeds, seed grain, flower roots, etc. We take pleasure in wishing this new firm success. Mr. Gleason has had 17 years experience in the seed business, and was one of the firm of R. H. Allen & Co., of this city until the present firm was formed. Mr. Everett was recently of the firm of Schlegel, Everett & Co., of Boston, and has had 37 years' experience. They are both, we believe, enterprising, capable, trustworthy men. The catalogues will be sent without charge to those of our readers who apply to them.

PROCEEDINGS of the New Jersey State Horticultural Society at its sixth annual meeting held at Newark, Feb. 10th and 11th, 1881. E. Williams, Recording Secretary, Montclair, N. J; J. T. Lovett, Corresponding Secretary, Little Silver, Mon. Co., New Jersey.

GEORGE SUCH, South Amboy, N. J. Catalogue of bedding plants, and of French Hybrid Gladiolus. Catalogue of rare plants for the hothouse and greenhouse including palms, orchids, ferns, etc., may be had on application.

PROCEEDINGS of the American Pomological Society, Seventeeth Session held in Rochester, N. Y., Sept. 17th, 18th and 19th, 1879. Robert Manning, Sec'y, Salem, Mass.

EIGHTH Annual Report of the New Jersey State Board of Agriculture. P. T. Quinn, Secretary, Newark, New Jersey.

PROCEEDINGS of the Western New York Horticultural Society of the twenty-sixth annual meeting held at Rochester, January 26th and 27th, 1881. P. C. Reynolds, Rochester, Secretary.

Literary Miscellany.

[Published by request.]

DRIVING HOME THE COWS.

Out of the clover and the blue-eyed grass
He turned them into the river lane;
One after another he let them pass,
And fastened the meadow bars again.

Under the willows and over the hills,
He patiently followed their sober pace;
The merry whistle for once was still,
And something shadowed the sunny face.

Only a boy! and his father had said
He never would let his youngest go:
Two already were lying dead,
Under the feet of the trampling foe.

But after the evening work was done,
And the frogs were loud in the meadow swamp,
Over his shoulder he slung his gun
And stealthily followed the foot-path damp;

Across the clover and through the wheat,
With resolute heart and purpose grim,
Though cold was the dew on the hurrying feet,
And the blind bats' flitting startled him.

Thrice since then had the lane been white,
And the orchard sweet with apple bloom;
And now when the cows came back at night,
The feeble father drove them home.

For news had come to the lonely farm
That three were lying where two had lain;
And the old man's tremulous, palsied arm
Could never lean on a son's again.

The Summer day grew cool and late;
He went for the cows when the work was done.
But down the lane, as he opened the gate,
He saw them coming, one by one:

Brindle, Ebony, Speckle and Bess,
Shaking their horns in the evening wind;
Cropping the buttercups out of the grass—
But who was it following close behind?

Loosely swinging in the idle air
The empty sleeve of army blue;
And worn and pale, from the crisping hair,
Looked out a face that the father knew.

For Southern prisons will sometimes yawn,
And yield their dead to life again;
And the day that comes with a cloudy dawn
In golden glory at last may wane.

The great tears sprang to their meeting eyes.
For the heart must speak when the lips are dumb;
And under the silent evening skies
Together they followed the cattle home.

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

(Continued from page 262.)

"These objections to the system" replied Mr. Glinden "presented some complicated difficulties in the early stages of its operation, but they have almost completely lost their force now. Inventions and discoveries, formerly, indeed, did produce complete revolutions in some branches of trade, so that there had to be much changing about from one trade to another among our people in order to equalize labor and its reward. The object of endeavor then, was to reduce labor by the aid of machinery so that the individual might have the greater portion of his time for mental improvement and the pleasures of social intercourse. It was found that four hours a day devoted by each citizen to his particular occupation was sufficient for the requirements of society, and necessary for the physical well being of the individual, and when this limit was reached in the different branches of trade, the stimulus to invention and discovery in the useful arts was withdrawn and this disturbing element has had little influence on the business of the country for four or five hundred years.

"By your second objection I suppose you refer to the fact that there may be some in the community, who if a living were assured to them, would, perhaps throw upon their family or their neighbors the burden of the olden time, we would indeed meet some difficulties in this objection, you must bear in mind, however, that the standard of morality is as high among us a single citizen who would not scorn to shirk any duty which he owed to his family or society.

"As to the complicated machinery of government necessary to preserve this system in its integrity, I may say, this objection is met by what I have just said in regard to the standard of morality among our people. In fact our government scarcely deserves the name of government, for the intelligence and morality of our people so direct and control their conduct that few laws are required, and these have only to be known to be obeyed. It is the views of men, which result from the unrestrained activity of their selfish and animal natures which require law. In a community where the moral and intellectual powers of the people are so habitually active that these inferior feelings are kept under control every individual is a law unto himself, and neither statues nor the power to enforce them is required. Of what use would be laws against murder among a people where murder is unknown and what need is there of laws against theft when every individual is honest or of laws against violence or fraud and deception of any kind where every citizen is the soul of honor and integrity.

"Wipe out from a nations statute books the laws which relate to these subjects, and what is there left? The mere skeleton of a constitution which prescribes the form of government, its offices and their duties.

'Complicated machinery,' as a term applied to government was very expressive and full of meaning in the olden time, but it has lost its appropropriateness now. Then the law-makers were law-breakers no less than the great mass of the people for whom the laws were made, and those who executed the law had to be hedged about and governed by the law even with greater vigilance than the people themselves. But among us no security is exacted from a public officer for the faithful discharge of his duties. And that complicated system of checks and balances which formerly made every officer of the goverment subject to the watchful scrutiny of some other officer has long since fallen into disuse. In fact that old question, whether that government which governs most or least governs best, has long since been solved in our experience, by the elevation of the moral and intellectual standard of our people, so that the wisdom and virtue of each citizen shall lead him to do right of his own free will.

"But even if any of our citizens should desire to accumulate wealth beyond the needs of life, such as they are regarded among us, it would be impossible for him to do so, because our habits and modes of life are founded upon such stable principles that demand, supply and value remain the same from generation to generation.

"I imagine the people of each ward of our city united by a social compact by which they agree to patronize only the tradesmen and manufacturers of their ward, and that the different occupations are skillfully divided that there is enough of business for each to give the same net income to all. Thus if it has been found by experience that ten grocers can maintain themselves in the ward by their business, in a style which corresponds with that of the people in general, the trade of the ward in their particular line is equally divided among them. If there are eight tailors, one-eighth of the population patronize each. If there are six boot-makers, each receives a sixth of the business, and so of all other occupations.

"As there are no fluctuations in our population, few changes of fashion, and great uniformity in our habits and modes of life, the tailor knows exactly how many suits of clothes he will have to make to supply his customers, the hatter how many hats, the boot-maker how many boots, the cloth manufacturer how much cloth, and even the farmer knows how much land to put under each crop so as to insure a ready sale for his produce, while the prices are so arranged that a uniform income is assured to every one. Extend this system so that it shall embrace the inhabitants of the country in conjunction with those of their neighboring city and you will have the explanation of your query. You will be also able to comprehend one important reason for that uniformity of social condition which is the great source of our happiness as a people."

"But, sir," said I, "are there no natural causes which sometimes completely subvert the regularity of this grand system of supply and demand?" A very wet or a very dry season even in the sparsely-settled countries of the olden time sometimes produced a famine, and what must be the effect of such seasons on a country like this, which has so nearly reached the limit of its productive capacity that it could not possibly sustain its inhabitants if they were increased by the addition of but one member to each family?"

"You must remember, my dear sir," replied Mr. Glinden, "that many things which were matters of ignorance and chance to the people of the olden time have become matters of knowledge and certainty to us. The vicissitudes of storm and sunshine, cold and heat are controlled by laws as immutable as those which govern the other departments of creation. Our ancestors did not know these laws and of course could not modify their conduct so as to make it harmonize with them. They sowed their seed in the Spring time, but could not tell whether they should reap twenty, thirty, fifty or a hundred fold or whether their labors should result in total failure.

"Now our knowledge gives us such a complete mastery over our soil and the causes which modify its productiveness that every farmer is as well assured of his regular income as the hat-maker or the tailor. There are no rots, blights, bugs, worms and beetles to destroy our crops. Those are only the parasites of imperfect modes of cultivation. While our knowledge of the laws which govern climatic changes is so complete that storm and sunshine are sufficiently under our control to insure uniform results to the tiller of the soil."

"What!" I exclaimed, "puny man control the elements of heaven!"

"Sufficient for our purpose," replied Mr. Glinden. "There is not a cloud which overshadows the sun, or a drop of rain which falls to the earth, but is governed in all its movements by uniform and immutable laws, which depend upon the condition of things on the earth and their relation to the atmosphere. Our progress in science has made us familiar with the causes which produce atmospheric changes, and enabled us to supply that condition of things which is favorable to such an alternation of storm and sunshine as will best promote the growth of the products of the soil."

"This is, indeed, wonderful!" I exclaimed. "What a blessing it would be to my country if I could only carry this knowledge back to it. And if I could introduce among my countrymen your marvelous system of supply and demand so that a good living might be assured to every one, I would doubtless have a monument erected to my memory as one of the greatest benefactors of my race.

"There are some serious drawbacks, however, to this system which naturally present themselves to my mind. And, first, are there not inventions and discoveries continually being made which have a tendency to increase production and diminish the hours of labor in many branches of trade, and thus cause great inequality in the amount of effort which your citizens of different trades must put forth to gain a livelihood? And has this system not a tendency to produce inactivity and lessen enterprise and thus throw upon the shoulders of some of your citizens a greater burden than they should justly bear? And surely a complicated machinery of government must be required to preserve this system in such a condition

that the rights of none shall be infringed, and each citizen's sense of justice shall be fully satisfied.

To be continued.

BRIC-A-BRAC.

SOME of the Chinese similes are said to be as pointed as they are sarcastic. They call a blustering, harmless fellow "a paper tiger." A man who places too high a valuation upon himself they compare to "a rat falling into a scale and weighing itself." A hunchback making a bow is what they call overdoing the thing. A spendthrift they compare to "a rocket," which goes off all at once, and a man who expends his charity on remote objects, neglecting his own family, is said to "hang up a lantern on a pole, which is seen afar, but gives no light below."—Gold Hill News.

The sexton's sweetheart's name was Nell
And she was called the village belle:
When hope had made the sexton bold,
One night his love for Nell he toll'd,
While to his neck she fondly clung,
And lovingly her hand he wrung;
Her sentiment with his just chimed,
And his appeal she thought well-timed,
And having toll'd his love so well,
She whispered he might ring the belle.
—Somerville Journal.

MARK TWAIN furnishes the following unique recipe for making a New England pie. To make this excellent breakfast dish, proceed as follows: Take a sufficiency of water and a sufficiency of flour, and construct a bullet-proof dough. Work this into the form of a disk, with the edges turned up some three-fourths of an inch. Toughen and kiln dry it a couple of days in a mild but unvarying temperature. Construct a cover for this redoubt in the same way and of the same material. Fill with stewed dried apples; aggravate with cloves, lemon peel and slabs of citron; add two portions of New Orleans sugar; then solder on the lid and set in a safe place till it petrifies. Serve cold at breakfast and invite your enemy.

CAPTAIN CORN.

Captain Corn in the garden,
Straight and strong and tall,
No matter how high his neighbors grow,
He overtops them all.
With silken plume and bright green cloak,
He really cuts a dash;
But when he marries Lima Bean,
He'll loose his rank—I think it's mean—
And be plain Succo Tash.

CURIOUS EPITAPHS.

Sometimes a pun or play on the name is introduced; such as in the epitaph on John White:

"Here lies John, a shining light,
Whose name, life, actions, all were White."

The following was rather epigrammatic than epitaphic in regard to the Rev. John Chest:

"Beneath this spot lies buried,
One Chest within another,
The outer chest was all that's good;
Who says so of the other?"

William Wilton, buried in Lambeth, certainly did not write the epitaph, which bears relation to him:

"Here lyeth W. W.,
Who never more will trouble you, trouble you."

Nor, we may safely assert, did Owen Moore himself pen the following:

"Owen Moore is gone away,
"Owin' more than he could pay."

More likely to be genuine are those epitaphs which involve a bit of bad logic, syntax, or grammar in their composition. In a graveyard at Montrose is said to be the following:

"Here lies the body of George
Young and all their posterity
For fifty years backwards.

And in Wrexham church-yard as follows:

"Here lies five babies and children dear,
Three at Oswestry, and two here."

Akin to this logical blunderlog is:

"Here lies the remains of
Thomas Milsolm, who died in
Philadelphia, March, 1752;
Had he lived he would have
Been buried here.

And another at Nettleben, in Oxfordshire:

"Here lies father and mother and sister and I;
We all died within the space of one short year,
We all be buried in Wimble, except I;
And I be buried here."

RUSKIN ON THE CLASSICS.—Books being "up" just now, I hear that the great Mr. Ruskin has been weeding out his library, and some of his works have brought absurdly high prices at a recent auction, not for the rarity and excellence of the books, but because they belonged to Ruskin. Such is the folly of the age. But, as usual, the money went into the pocket of the book dealer, and by a very cunning little device. Mr. Ruskin was asked if he wouldn't just write a line on the fly-leaf of the rejected volumes with his initials. So, in his innocent and frank way, he wrote on his "Demosthenes's Orations;" "Old school trash; never read a line of it. J. R." And on his "Pliny;" "Poor stuff, not worth the paper it's printed on," and so on. These books, with their quaint comments, sold for twenty times their real value.—London Truth.

The New England senators, a Washington correspondent says, would not average up over $150,000 apiece. Hale represents the most money, and Blaine perhaps next, nor can Rollins be a poor man. New England and the South send to the upper chamber men poorer in worldly wealth than either the Middle States, the West or the Far West of the Pacific coast.

For Women.

CONDUCTED BY MISS RAY CLARK.

SEE SPECIAL NOTICE TO THE SUBSCRIBERS OF THE RURAL NEW-YORKER on the editorial page.

CONCERNING THE BEHAVIOR OF GIRLS TOWARD YOUNG MEN.

MARY WAGER-FISHER.

MANY girls, during a season of gayety, as has been the past winter with its abundant sleighing which always develops social festivities, make the acquaintance—or fancy that they do—of "new" young men, with whom possibly they have "fallen in love," and expect to marry. To "fall in love" need not necessarily be an extremely serious matter, but to marry, *is*. As Mr. Talmadge very pithily put it, "marriage is to a young man the most tremendous thing between the cradle and the grave." If it be "tremendous" to a man, it is super-tremendous to a woman. Moreover, it is one of those arrangements, the force and importance of which, no one, before marriage can fully realize. It requires at least three or four years of married life, for either a man or a woman to understand its full significance and for some persons, even a longer time. The wedding-frock, the wedding, the honeymoon are very small account in comparison with what lies in the future. I believe that it is generally conceded that when a girl is bent on marrying a certain person that it is a waste of words to attempt to dissuade her otherwise. There may be some use, however, in attempting to persuade her to find out who it is, whom she is going to marry.

I have two cases in my mind; young women who married men with whom they were so very much in love that they would "die" if they had to live without them and who learned after a little while that the men had already been married, and their wives were still alive and well. One of these cases was a peculiarly sad one. The young lady lived with her parents in a university town in central New York, and the man she married, first saw her in the street, from the piazza of the hotel where he was stopping, inquired who she was, where she lived and learned various particulars about her family. Among other things, he learned that she had relatives living in an adjoining state. His first step was to forge a letter of introduction from one of these distant relatives, and then he called upon the young lady with his credentials. Of course, she and her parents thought it must be all right, and at the time gave the matter little thought. However, as the young man's attentions became very marked and the young people announced that they were "engaged," the parents thought it worth while to inquire into the young man's antecedents, etc, so they dispatched a letter to those distant relatives who returned answer that they had given no such person a letter of introduction, and the matter being pursued, it was found out that the fellow was from a certain town in New England where his wife was meantime living.

"Oh," exclaimed the mother with a deep sigh, "how thankful we should be that we have learned this before it was too late." "Ah, mother, it *is too late*," shrieked the stricken girl; "we are already married."—they had been secretly married a fortnight before, at the continued solicitation of the young man who was "so madly in love"—and the girl who, in her foolish fondness, thought her lover the most perfect person in the world, weakly yielded to his persuasions, and they were married by a country parson upon one of their many rural rides. The young man nearly escaped the officers, who were placed upon his track by the outraged father of the girl, but finally he was captured, tried for bigamy and sentenced to five years imprisonment in the Auburn State Prison. The affair killed the girl. On the day before the convict was to be taken to prison, she begged of her father as a dying bequest to be allowed to see the man she had married. Her request was granted and the sheriff brought him to her bedside, where she lay with the touch of death upon her. She stretched out her thin arms toward him, beseeching him in words that melted every one about her to tears, to promise her that he would reform and lead a better life. The fellow simply sneered at her prayers and when asked by the sheriff if he had no pity for his victim, he lightly laughed and said that girls who "took up with any fellow that happened along weren't worth much." On the following day she died.

As the bigamist was being escorted to Auburn there was one other person who should have gone along, manacled with him, for ten years' imprisonment, and that was the country parson who had married them.

The villain uttered a grave truth when he said that a girl who takes up with any fellow that happens along is not worth much. It is precisely what any girl who marries without knowing to whom it is that she intrusts her happiness may rightly label herself with "not worth much." And this leads me to what I had in mind to say at the outset, that very many girls now-a-days do not seem to put a very high valuation upon themselves. Only a few years ago young men felt obliged to behave themselves with outward decorum, at least, when in the presence of young women. They never presumed to make use of tobacco in their society. But now I see them smoking cigars, sitting or standing with hat on head, or lounging with crossed legs mounted comfortably high in the air in the immediate presence of young women whom they are supposed to respect, and all this with no protest from the young women themselves.

Women are unquestionably the conservators of society, and there is no moral force so strong to restrain vice of any description as the decided and emphatic protest of women against it. The man does not live who does not respect and honor a woman the more for such protest, and respects that woman most who puts him upon his best behavior, and develops within him best energies. If the young woman, who when asked if tobacco smoke is offensive to her, replies, "Oh, no, not at all!" thinks that her agreeable reply raises her in the esteem of the smoker, she is entirely mistaken. There are women who do *not* dislike fresh cigar smoke, at least they say so. But no woman likes stale smoke—the smell of tobacco six hours old, or the smell of a man's breath that smokes or chews. They are all disgusting and abominable, and nobody knows it better than do the men addicted to the vice, and who never fail to deplore seeing their sons form the habit. If a man uses tobacco before marriage with as much nicety as is possible, he will be very likely to indulge in it without the nicety in his own home, and the wife will have stale smoke and a disgusting breath to catch whiffs of, *ad infinitum*.

Some one has said, "Of course, marry for love; but when you are about to fall in love, see that it is with somebody who has money." Money, honestly earned, is never an objectionable feature in a matrimonial alliance, but what is of far more consequence, and far greater importance (as the other may be of no importance, whatever) is to marry a man of good family. Girls often say, "Oh, but I'm not marrying his family." But they do, in a way, nevertheless. One can't get away from early habits and early associations, and the influences under which the ordinary young man has grown up, fashions him for all time. A family may be very poor, and still be refined and gentle, but no amount of money or position can cover the vulgarity of low birth and low breeding, and no amount of love or fondness can long abide it with happiness.

Moreover, in marrying, a girl should bear in mind that she should consider the welfare of a probable posterity, as well as her own, and before accepting a man for her husband she should ask herself whether in all probability he will make a good father, as well as a good husband, and whether he is free or not from such taint in the blood as develops into scrofula, insanity or other painful and ruinous maladies. The sort of flimsy "sticks" that some girls accept for husbands, and *vice versa*, is amazing, and if a girl cannot marry, and satisfy her head as well as her heart, she had far better remain unwedded, which is both honorable and respectable, while to be married to an inferior or unworthy person, is continual degradation.

WINTER.

BERTHA A. WINKLER.

MATTER-OF-FACT people, those heavy stoics of the imagination who compose the world's solidity and maintain her steady equipoise on the other side of the soaring visionaries, tell us, in so many plain words, as though language was not used to adorn, that thou art nothing more than a quarter of time's cycle subject to northern winds and change of temperature. But eyes veiled in fancy's softer, richer hue, see thee more grandly and not less real. Art thou indeed only one-fourth of a year? A chill, empty space of time called Winter, nothing more? No, eternal monarch of the North, there is a dreadful grandeur in thy stern majesty; thy icy sway compels a fearful tribute of sacrifices and human woes when once a year thy freezing elements march beyond the boundaries of their icy home for tributary lands. Thy coming, thy presence and thy reign are imperious subjects of the poets feeble praise and destitute humanity's loudest wail. The fortune-favored may ignore thy power, secure in comfortable housings; thy piercing glance means only woe to those of scanty raiment.

Tender, thoughtful Nature, at the first approach of thy northern windy heralds, removed earth's green garb and wrapped her all in somber gray that thou mightst not find aught attractive or to blight. I wonder not that thou wax fiercer drawing nigh; thy searching eye met barren desolation far and wide, and thou hast acknowledged the cheerless welcome with the quick spreading of thy cold white mantle of charity in mock, bitter courtesy. Then were thy warring elements marshalled to the front, shrieking furies freezing and merciless shooting through the air, palsying all but the warm heart; storms, tempests carrying rude devastation in their eyes, playing with firm-rooted defiance on land, playing with iron-clad dwellings on sea; playing the game of destruction with all but the ocean's wild main, he, thy more than compeer in the hights of thy power, being conquered of none, thy courteous host in thy exiles tour, will open his watery arms to receive thy finally scattered and vanishing forces.

Thy fierce reign is drawing to its close. Nature, weary of thy icy breath and resenting the cold presumption which dared extend thy blighting sceptre over Southern climes, has welcomed to her bosom a queen gentle, reviving, whose coming stirs a life which thou never could'st call forth; in whose benign smile flourish beauties strange to thee. She will compel thee to yield thy temporary throne to her, yet not sternly. Thy conqueror is beautiful and gentle; she will melt thy tyrant heart and thou wilt depart, not like the storm-king thou hast been in the meridian of thy power, fiercely contesting every inch of thy possessions, but, like a huge frozen colossus, helpless of thine own severity, till her breath move thee to flee in the abject weakness of liquid grief towards the ocean's sources.

There is a strange charm in contemplation of thy breaking power, the fading of thy brilliant grandeur, and the slow dissolving of thy icy legions, who, mingling with the waters adding to the ocean's wealth, will never more unite. Like all things transitory, thou must hence with little else than name; like all great tyrants of thy scattered force, forsaken, we exultantly wait thee a long adieu! Roll on, ye frozen remnants of his memorable reign; thy tyrant-master is too weak to hold thee 'gainst the gentle force of Spring, and Earth's bosom heaves thee off for precious, fruitful weight! Roll on, ye icy legions, to the sea! Seek quarter in its annihilating waves! The queen of beauty, mildness, hope of plenty, has begun her reign.

CLOTHING.

[MARY BURROUGHS gave a description of clothing which, if memory fails not, is a counterpart of the following—however the information is good enough to bear repeating.]

The clothing described and recommended by Mary Wager-Fisher, is an improvement over the dress of some women; but I think it can be improved upon. It is not necessary to have more than one band at the most, while the described dress, contained three. All unnecessary thickness should be avoided about the hips and waist. I hope that the "lady readers of the RURAL," will think twice or more, before making a change for the Summer or Winter.

Here is my ideal dress for Winter, which I think will commend itself to every thinking woman. I would have the first garment, a white flannel chemiloon, reaching from the neck to the ancles, with an opening down the front and a necessary opening in the back. Over this I would have a colored chemiloon reaching a little below the knees. At the waist of this chemiloon I would sew six buttons, two on the back, one under the sleeves and two on the front. Next would be a skirt with a loose band containing button holes to correspond with the buttons on the chemiloon. Now comes the dress with skirt and basque attached in this way. The front and sides of skirt should extend about a finger up under the basque, and should just reach around to the side pieces of the back of the basque. These breadths are to be sewed firmly to the lining of basque. The back breadth of the skirt should be of the usual length, and extend up under the back part of the basque, and sewed to the seams of the basque after a band has been added. The dress being in one piece can be easily put on, and is as comfortable as a fitted wrapper, while it is a skirt, over-skirt and basque. I make my dresses this way, and I like it better than any other of the many ways that I have tried.

The whole dress contains but one band, excepting the little one on the back of dress. This one band can be avoided by attaching the under skirt to a sleeveless waist: but I do not think that the extra waist would be needed with the two flannel under garments. I am just selfish enough to say that I cannot see where this plan of dress can be improved upon. Some may prefer canton flannel for one of the chemiloons, or Shakers under the colored, or even canton over flannel; but no matter, every one must be their own judge as to the quality and kind of material used to secure the necessary protection. It is the *plan* that I wish to introduce. MRS. M—C.

FASHIONS.

The reign of handsome plain silks is coming again this Spring, we are glad to say. Faille itself—good, simple faille—will be once more employed for a great many toilets, but the plain tissues in the gros-grains, ribbed coteline, and Victoria styles will be most fashionable.

Black silk is very fashionable for dinner and evening-dresses. Black is generally becoming to both old and young, and it sets off jewels to great advantage. Gros-grains is combined this Spring with black brocaded silks and satins, black beaded lace, and embroidery.

SPRING dresses are made of fancy woolen materials, both plain and figured, combined much in the same way as those of the Winter in thicker fabrics. Such costumes require but little trimming. Some have the skirt of figured material, and the second skirt cut princess fashion all in one with the bodice; it is self-colored, of the shade prevailing in the figured fabric; shades of gray and prune are preferred. Pipings of satin are often added to give a certain degree of quiet elegance to the costume; these pipings should not be too bright, but of such tints of old-gold, steel-gray, nut-brown, dahlia, violet, or dark heliotrope, and are a very nice finish to simple woolen costumes. Young ladies add to such dresses a semi-long paletot of the same material, and trimmed to correspond; but matrons, who do not care to wear their handsome silk mantles with such dresses put on light shawls, either neutral-tinted plaids upon white grounds or self-colored. The light shawl is most useful at this season of the year for morning walks, shopping, and so on.

A pretty dress of prune ribbed silk is trimmed round the bottom with an extremely fine flutting. Above this comes a very deep flounce, put on in thick, separate pleats, then a drapery across the front. A tunic is pleated over the hips, then forms a puffed tournure at the back; the fronts of the tunic are edged with an embroidery pattern of irridescent beads. High-necked bodice, with long basques in front and at the back, slanted off over the hips; this bodice is trimmed with bead embroidery similar to that on the tunic.

CORRESPONDENT'S CORNER.

EDITORS are supposed to know everything, therefore I presume to ask a few questions, from Mary Wager-Fisher's article, headed "A Question," which appeared in the RURAL April 2, page 231. 1. Where does she live, and did she ever visit the rural districts? 2, Was she ever nurse in the army hospital, and did she ever feed any of the patients soup from a spoon? 3, Did she ever eat mush and milk or bean soup? In fact did she ever put on a clean calico apron, roll up her sleeves to her elbows and wash dishes, or get down on her knees and scrub the floor? That would give her an appetite, sure. A. B.

[We publish the above, presuming it to be significant to the writer, and perhaps to the person in question.—R. C.]

A subscriber asks, What is Cheviote cloth?

ANS.—It is an all-wool cloth having the appearance of flannel, somewhat rough on the face, the twill being more distinct on the under side. R. C.

Will you please tell us women readers that live in the country, away from many things we would like to get, something about Honey Comb Spirals, and where they can be obtained. W. C. S.

ANS.—Honey Comb Spirals are delicate shavings of wood in many colors. They are used for making boxes, baskets, frames and other articles useful or ornamental. Burt & Prentice of 26 Beekman Street, New York, will furnish a package of 250 spirals with wire and instructions for 21c.

We will answer inquiry of poem in a later issue if possible to do so. R. C.

Hop Bitters cures by removing the cause of sickness and restoring vitality.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

ANOTHER WEEK FROM MRS. CLAY'S JOURNAL.

ANNIE L. JACK.

TUESDAY. There was a church social last night a few miles off, and as I had been appointed to recite, and Nora with Karen and Celia were part of the musical programme, it became a question how we should get along without Janet. But Lonsdale offered his services as nurse, with papa to look after the house, and as I was sure baby would sleep all of the evening I consented to go without any grave misgivings. And the result was all I could expect, for everything was peaceful on our return, and I was glad to find a boy could be a safe housekeeper. It is a great mistake not to teach boys as well as girls to help in the kitchen and to take it as a part of his duties to pare potatoes, clean knives and help with the dishes, and in the long Winter evenings to knit and mend for himself. It is a part of his education that will be very useful to him in after life. But you must begin *young* before other habits are formed, or it may not be possible to accustom him to the work as a matter of course. I do not think any action of a young lad can lower him more in my opinion in domestic matters than the act of giving his boots to his sister to clean, as is the case in some families. Of course, it is the parents' fault in the first place; but it shows a lack of common courtesy on the part of any young man to expect this work to be so done that he is fully as able to attend to as a young girl.

In using the last of our celery lately, we made a firm resolve to plant more of this pleasant, refreshing vegetable. For those who like it, nothing is better in April days than a relish of its crisp, tender stalks for tea, before radishes are plentiful. As a corrective to the system, now that fruit is getting scarce, I think it is valuable. I was saying to-day during dessert, that I hoped some day before long there would be found a grape that will keep, and a way of keeping it—to give us more variety in our Winter fruits. I have tried several plans, but the trouble is that the berries drop off the bunches, and defy all the recipes. Neither do they can successfully, though as a jelly the Concord is quite a treat at this season of the year. How glad one feels as the days lengthen for a good supply of preserves and jelly. It seems in country places the worst season for pies and puddings, unless one has plenty of eggs. A full supply of canned fruit is wholesome and profitable, something the housekeeper can appreciate after her hot summer's work. She will find it useful "after many days," and it is a comfort to think that there is some compensation for a housekeeper's toil, for I do not wonder that at times one feels inclined to be weary of well doing. "If things would only stay done for a while," I said, as I washed Alex's face for the fourth time, but things have to be done over and over again until the very routine grows wearisome. I do not know of anything that is a more grateful change in a woman's life, than that brought by the seasons—if she can give her mind to gardening. The changing flowers that come and go, the interest one can feel in their habits and duration, with the care of cultivation is a good panacea for care and discontent, and brings one nearer to Nature than any other occupation can do.

BREAD HEAVY IN STREAKS.

IN setting bread to rise, if the bottom of the pan is too cool and the atmosphere at the top of the loaf too hot, there will be a heavy blue streak at the bottom of the loaf and great unsightly bubbles at the top after it comes from the oven. To avoid this, set the pan on warm bricks, cover with a cloth, and put it in the oven just before it is light enough. The best bread is well kneaded to create small, even and regular bubbles, as there is a more perfect "rise," the evaporation is much less, and the bread when brought to the table is more moist. No one likes coarse-looking bread, distended with large bubbles and as dry as a chip. CHIEF COOK.

ROBBIN'S WASHER.

IS NOT the statement of Mrs. M. H. a little far-fetched regarding the Robbin's Washer? That *half a cord of wood* certainly goes beyond anything I have seen, though doing the washing for a dozen in a family. It would not do to depend *wholly* on the washer, but if the rules are observed it does not take long for a thick, full, constant stream of water to act upon the clothes and help the cleansing. For flannels, bed clothes and coarse, rough clothes it is admirable and labor-saving. I was sorry to see such a sweeping assertion. The greatest fault will be if the outer coat wears off, as was mentioned a week or two ago. Ours, however, is as good as new; but we do not expect it to do *all* the work. ANNIE L. JACK.

Trichinosis; The Cooking of Pork.

The following directions for well cooking the flesh of pigs we take from a circular published by the corporation of Birkenhead, England, during the recent trichinosis scare.

"Hams, sausages, and like articles, whether or not they have been smoked or salted, should never be eaten in the raw state.

To be efficient for the required purpose, the cooking of pork, or hams, and other articles should be prolonged for about half as much time again as is customary. The smallest joint should be cooked for not less than an hour, and whatever be the size of the joint it should not have less than half an hour's cooking for each pound of meat. No part of a joint that is seen to have an underdone portion in it should be eaten. In boiling hams or pork, the meat should be put into cold or lukewarm water, and the period of cooking should be reckoned from the time when the water boils.

In boiling several joints of pork or several hams (as required at institutions and elsewhere), they should not be put together in bulk at the same time into the same vessel. Each joint should be put into a separate vessel and boiled with a good quantity of water."

We advise our pork-eating friends to give a thought to the above.

Chief Cook's Pound Cake.

Mrs. F. James writes: "Will Chief Cook tell me if soda and cream-of-tartar are used in the recipe for pound cake? I cannot understand how the cake will be *perfectly* light without soda. Please give the recipe in *full*."

We believe the recipe was given in full in the RURAL NEW-YORKER of March 26. If Mrs. James will carefully read the directions given by Chief Cook, she will at once see that the ingredients are butter, sugar, eggs and flour and *nothing more*. It is the *thorough beating* of the first three articles that makes the cake light not soda, cream-of-tartar or baking powder.

DOMESTIC RECIPES.

Potted Fresh Mackerel.

LET the fish, after dressing, lie in salt water for half a day. For every five pounds of fish take three ounces of salt, two of pepper and one of cloves. Cut the fish into pieces and place in an earthen jar in which it is to be cooked, first a layer of fish then a sprinkle of flour, spice and bits of butter, repeating until all are in. Pour over equal parts, vinegar and water, and cover tightly with a floured cloth, so that no steam can escape, and bake six hours. Let remain in jar until cold. Cut in slices and serve for lunch or tea.

Floating Island.

Make a boiled custard of the yelks of six eggs, a large quart of milk, sugar to sweeten and a pinch of salt. The yelks must be well beaten and strained before adding to the milk. Flavor the custard and while boiling hot pour into a dish and spread the whipped whites smoothly over the top. Cover tightly to cook the whites. When cold, sift powdered sugar over the top, and you may if you wish, strew over grated cocoa-nut, or bits of jelly or jam. Very nice. MARY B.

Robust and blooming health in Hop Bitters, and no family can afford to be without them.

Implements and Machinery.

VANSICKLE'S
Shir Sling, Hay & Grain Unloader
HAS NO EQUAL.

Its Economy,
One-half time, labor and expense.

Its Capacity,
Double that of any Horse-Fork.

Its Convenience,
Unparalleled in Changing.

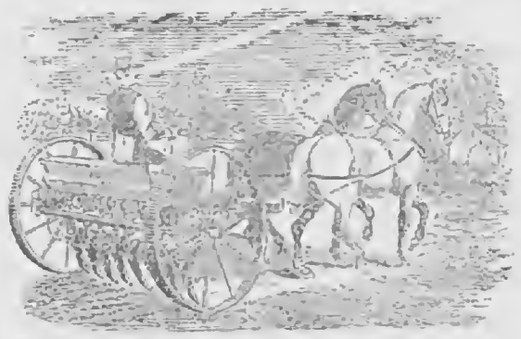
Its Adaptation
To all kinds of farm produce.

Its Facility.
A boy twelve years old can operate it easily.

Its Cleanliness,
25 loads unloaded and did not scatter one bundle.

WARRANTED in all the above statements and to give satisfaction. For descriptive circular, address
G. VAN SICKLE & SON,
Shortsville, N. Y.

The New Buckeye Force Feed



GRAIN DRILL.

ALSO
THE NEW BUCKEYE
Combined Force Feed Grain and FERTILIZER DRILL,
AS IMPROVED FOR 1881.
Over 100,000 Now In Use.

The Buckeye has the largest sale of any Grain Drill in the world, and they are pronounced by all to be the most *perfect* SEEDING MACHINES in the country. No Grain Drill ever made gave such UNIVERSAL SATISFACTION. It is the best force-feed in the market. Our Fertilizer Sower has a positive force-feed and has no equal. Send for our circular giving illustrations of new improvements. Address P. P. MAST & Co.,
Springfield, Ohio.
Branch Offices, 216 N. Broad St., Philadelphia, Pa. 11th St. and Clarke Ave., St. Louis, Mo.

Also manufacturers of Buckeye Broadcast Seeders, Buckeye 11-foot Sowers, Buckeye Riding Cultivators, Buckeye Walking Cultivators, Buckeye Plow Sulky and Buckeye Cider Mill.

Miscellaneous.

ST. JACOBS OIL
TRADE MARK.

THE GREAT
GERMAN REMEDY.
FOR
RHEUMATISM,
Neuralgia, Sciatica, Lumbago,
Backache, Soreness of the Chest, Gout, Quinsy, Sore Throat, Swellings and Sprains, Burns and Scalds, General Bodily Pains,
Tooth, Ear and Headache, Frosted Feet and Ears, and all other Pains and Aches.

No Preparation on earth equals ST. JACOBS OIL as a *safe, sure, simple* and *cheap* External Remedy. A trial entails but the comparatively trifling outlay of **50 Cents**, and every one suffering with pain can have cheap and positive proof of its claims.

Directions in Eleven Languages.

SOLD BY ALL DRUGGISTS AND DEALERS IN MEDICINE.

A. VOGELER & CO.,
Baltimore, Md., U. S. A.

Agents Wanted.

$72 a week, $12 a day at home easily made. Costly outfit free. Address True & Co., Augusta, Maine.

$100 A MONTH for Agents on our new Book: **THE GOLDEN DAWN; or Light on the Great Future.** Send for Circular. Also send address of 2 or more Book Agents, and 10 cents for cost of mailing, and receive The People's Magazine for 6 months. P. W. ZIEGLER & CO., 915 Arch St., Philadelphia, Pa.

AGENTS WANTED FOR THE
SUMMIT
Stove-Pipe Shelf.—*THE MOST convenient article ever offered to Housekeepers. One Agent made $144.67 in ten days. No freight charges.*
Address, R. S. HARTZELL & CO.
124 South Third St., Philadelphia.

AGENTS WANTED EVERYWHERE to sell the best Family Knitting Machine ever invented. Will knit a pair of stockings, with Heel and Toe complete, in 20 minutes. It will also knit a great variety of fancy work for which there is always a ready market. Send for circular and terms to the **Twombly Knitting Machine Co.**, 409 Washington Street, Boston, Mass.

$66 a week in your own town. Terms and $5 outfit free. Address H. Hallett & Co., Portland, Maine.

ACTIVE AGENTS, Teachers, Students, Men and WOMEN Wanted to sell **TESTIMONY OF THE AGES,** By Herbert W. Morris, D. D. Author of Science and the Bible, etc. A Grand Array of Evidences to the Truth of the Word of God from History, Natural Sciences, Modern Research and Every Department of Human Knowledge. Recommended by the Press and Leading Clergy of all Denominations. A Magnificent Volume Suited to the Times. Clear Type. Fine Illustrations, Paper and Binding. Sells rapidly and Agents Easily Clear **$60 to $100 per month.** Send for Description and Terms to
J. C. McCURDY & CO., Philadelphia, Pa.

$5 to $20 per day at home. Samples worth $5 free. Address Stinson & Co., Portland, Maine.

News of the Week.

HOME NEWS.

MONDAY, April 18, 1881.

In the vicinity of Yankton, Dakota, there has been more suffering from the floods. Nearly all the stock on the lowlands, hundreds of thousands of head, was drowned. Farm houses were submerged or floating about in the water. Of 20 houses on Green Island only one remains. One hundred and twelve persons were recently rescued from Mayville where they had been surrounded by ice and water two weeks. A careful estimate shows that fully 7000 people have been driven from their homes and one-half this number have lost everything but the clothing they have on. The Government is aiding the sufferers, but as this is meager help public aid is requested—to be sent to a relief committee organized at Yankton. The Governor advises the shivering sufferers to collect in churches and other large public buildings and burn as necessary fuel what remains of their homes, hoping that the government will make an appropriation to compensate their losses.

Still the Congressional "bull dogs" are holding on. Neither party is willing to yield to the other, simply on account of a few minor Senate offices. The senatorial wise-heads are trying to make the people believe that a great break in the South is impending and that as Mahone goes "so goes the Union"—of the Southern States. In the meanwhile all senatorial business is at a stand-still. Judge Robertson is not yet confirmed as Collector of this Port.

THE Tennessee debt settlement adopted last week is more favorable to the creditors of the State than any one of the plans before proposed for refunding. One plan took the debt at $20,221,300, with $4,000,000 of past-due interest, and proposed to scale this total 50 per cent. and pay four per cent on the amount thus obtained. The new plan proposes to issue dollar for dollar on all the principal and interest now due and pay interest at three per cent, coupons receivable for taxes. The debt now aggregates with interest due $25,685,000, and interest on this will be $770,550.

At a recent meeting of the trustees of Hamilton College, at Clinton, N. Y., the Rev. Henry Darling, D. D., of Albany, was elected President of the College. Rev. S. G. Brown, resigned. The new President's salary is $4,000 a year, with house.

The appropriations made by the last Congress amount to $177,846,993 87, being upwards of $6,000,000 more than the appropriations made for any fiscal year since 1872.

At the close of the meetings of Moody and Sankey, in San Francisco $82,000 were raised to pay off the debt of the Young Men's Christian Association building in that city. Mr. Moody pledged a large part of it and $60,000 was also subscribed for the evangelistic work of the Association. The evangelists have been laboring on the Pacific Coast six months and the result has been a large accession to all the churches.

Assistant District Attorney Bell on the 14th inst, in the General Sessions Court, in this city, called to the bar James O'Brien, alias Robert, or "Bob." Lindsay, who, during the last political campaign deposed that he knew H. L. Morey, the individual to whom it was alleged President James A. Garfield wrote what is known as the "Morey Chinese" letter, and who subsequently confessed that he had perjured himself. He pleaded guilty to the indictment for perjury presented against him, and Judge Cowing sent him to State Prison for eight years.

At the last meeting of the World's Fair Commission there were about as many reporters as Commissioners present. Subscriptions from the transportion companies are relied upon as the principle means towards success, and unless they respond liberally the fair cannot be held because other capitalists will not give money in advance of the railways.

The Illinois General Assembly has made a movement to place all cities of over 100,000 inhabitants under control of the State as far as the police is concerned. Much complaint comes from Chicago that the Mayor is unable to enforce the laws against rum shops, gambling dens, etc., with the present police system, since beer drinking policemen will not bring to account those who furnish them with liquor.

They have a novel way of depositing ballots over in Jersey City. The evening previous to the recent annual charter election, something wrong about the ballot boxes was suspected and on opening the boxes for examination, two of them were found to contain a bunch of tickets each, nicely inclosed in a rubber band and tacked to the top of the box. This is voting by proxy, you know!

One Hattie Duell, of Iowa City, has been trying to live on nothing, and she did so—until she died. For over 47 days she took no nourishment other than water. She was thought to be insane.

The salt discovery at Manistee, Michigan, gives confidence of a future for that place by the building up of a great industry in that region. The salt was discovered by boring at a depth of 1,950 feet. The salt stratum proved to be 31 feet thick. The brine flows freely and is found to yield salt of good quality. The bore was made by lumber dealers in Manistee, and extensive salt works will be started immediately. Fifteen or twenty new wells will be put down during the Summer, which will be sunk in the vicinity of the large steam saw mills in the place, and the refuse from the mills will be used in salt boiling. Manistee is on the east shore of Lake Michigan, 110 miles from Milwaukee and 180 from Chicago.

In consequence of a strike of the Chicago street car conductors and drivers Thursday, no cars were run on the west side lines, the company being left helpless. They attempted to run cars Thursday morning, but as soon as the passengers in the initial car understood the situation they dumped it into a ditch, and cheerfully resumed their journey down town on foot, and no other attempts were made by the company.

Another outbreak of the Utes seems probable at an early day. At the Uncompahgre agency the settlers have their cabins loophooled and sleep on their arms, anticipating trouble. There are seventy families in the Uncompahgre country, and only one hundred soldiers at the cantonment. The settlers have petitioned the Governor for protection.

"It Works Like a Charm."

A patient in Indianapolis, who was a great sufferer from *Rheumatism*, sent for Compound Oxygen, and a week after receiving it, wrote: "It works like a charm! *For six weeks I had suffered agony, and nothing relieved me until your medicine came.* It is one week to-day since I commenced the inhalations, and the improvement is wonderful, and I thank God and you." "Treatise on Compound Oxygen" sent free. Drs. STARKEY & PALEN, Philadelphia, Pa.

AGRICULTURAL NEWS.

ADVICES from Great Britain inform us that there is this year an unprecedented demand for polled cattle, especially for those of the Angus breed, for importation to this country.....Last Wednesday, the 13th, an examination was made by Dr. Paton, Chemist of the Chicago Health Department, of 400 hogs taken at random in the packing houses in the Stock Yards, 20 pieces being carefully inspected for trichinæ in most cases, but not a trace of the pest was discovered.....Selections of the Bow Park herd of Short-horns, raised by the Farm Stock Association, Brantford, Ontario, and owned by the Hon. George Brown, late editor and owner of the Toronto Globe, were sold at auction in Chicago last Wednesday. Fifty-four head of cows and bulls brought $27,915. Among the noteworthy sales John Wentworth bought the yearling, VIII. Duke of Kirklevington, for $1,700; C. A. De Graff, of Wisconsin, bought the Duchess of Oxford XXI. for $4,200; H. L. Stout, of Dubuque, bought the Duke of Oxford XLVI. for $2,350, and Kirklevington Duchess XXVI. for $2,550. This was the initial sale, and prices were much better than expected. .....The Wisconsin Legislature has appropriated $4,000 to aid the Professor of Agriculture to make experiments with Amber-cane sugar during the season. The original bill asked for $6,000, but as it was agriculture, not politics, that was concerned, the appropriation was cut down $2,000 ..... Over 80,000 buffaloes have within six months been killed in Montana, mostly for their hides, which bring from $2.25 to $2.75. The last wild Indian is likely, ere long, to ride to the "happy hunting ground" on the last buffalo.....

The aggregate pounds of hog product (hams, bacon, pork and lard) exported from the United States to principal consuming countries compare as follows for three years, ending June 30:—

	1880.	1879.	1878.
England	645,691,439	579,603,407	480,732,348
Scotland	58,027,572	57,115,226	73,364,644
France	123,528,287	98,133,780	105,346,385
Germany	113,612,667	128,179,048	114,078,481
Belgium	104,406,720	110,897,216	80,934,814
Cuba	31,137,218	33,062,818	34,345,076
Netherlands	16,994,845	19,225,375	12,881,561
Hayti	16,321,266	15,473,032	15,675,120
Quebec, Ontario, etc.	28,410,811	15,521,634	18,426,756
Sweden & Norway	7,708,974	10,925,989	10,593,429
British W. Indies	10,709,446	10,848,919	10,561,670
Other countries	75,252,930	63,765,291	49,622,603
Total pounds	1,330,702,175	1,143,309,938	1,007,469,860

The Milwaukee Republican of the 12th published advices from the Northwest as regards the Winter wheat prospect. It summed up by saying:—"In brief it may be said that the Winter wheat reports are decidedly unfavorable. Wisconsin is out of the deal, both as regards Winter wheat and the possibility of seeding before the first week in May; Iowa is in about the same condition as Wisconsin; Southwestern Minnesota will not sow before May; Southeastern Dakota is practically blockaded; but by far the greater portion of the Spring wheat area of Minnesota and Dakota is in condition to begin general seeding within a week or ten days, or, if the storm of yesterday has ceased, by the last of this week."....The Wisconsin State Fair is to be held at Fond du Lac, commencing Sept. 26..... The Governor of Nebraska has named the third Wednesday in April as Arbor Day.....

The Utica, N. Y., dairymen's board of trade will hold its first sale day for the season, April 25th. The annual election of officers will then take place.....The great parish of St. Pancras (London) which contain about 100,000 people, maintains a farm of eighteen acres for the instruction of pauper children in agriculture. By a report just made, it appears that the establishment netted $1,300 for the last half year.....President Parker, of the Produce Exchange of this city has written to Statistician Nimmo at Washington that it is within the powers of the Treasury, and probably not within the powers of the States, to provide for discrimination between butter and oleomargarine cleared for export at the Custom House..... Bradstreet published last Saturday a summary of the cotton situation with regard to both the old and new crop. Down to the end of March the port receipts and overland movement for this year amounted to 5,481,345 bales, against 4,959,194 for the same time last year, an excess of 522,151 bales. Estimating the receipts for the rest of the season as the same as those of last year, gives a total yield for the crop of 1881 of 6,283,403 bales. As yet there are no indications of any sudden falling off in the receipts. The stock at interior towns is no less than it was a year ago. The port receipts for the first 12 days in April have been 68,000 more than in the same time last year. Estimating the probable increase of receipts during the remainder of the year, the total yield is placed at 6,422,000 bales. The opinion is expressed that the present enormous consumption of cotton by the mills will still further increase. Regarding the outlook for the coming crop, the reports say planting is about fifteen days later than last year. In some regions operations are fully a month late. Fertilizers will be used more than heretofore, notably so in the Carolinas and Georgia. Present indications are that the cotton acreage, as compared with last year, will show some increase in the Carolinas, Georgia, Florida, and Texas, while there will probably be no change in Alabama, Mississippi, Louisiana, Tennessee, and Arkansas.

The Legislative Committee on Public Health which has been investigating oleomargarine here, consists of Messrs. Fenner, Palmer, Hayes, Roberts, Hunter, Campbell, Derrick, Lewis, Newman, Donoho, and Willis.....Three or four weeks ago we intimated here that the Hon. G. B. Loring, of Mass., had "the inside track" for Gen. Le Duc's place, and as time goes on, the probability grows stronger that he will get it—if it is vacated by the present incumbent.....Throughout Minnesota and Dakota the weather was still very unusually cold as telegraphed on the 15th inst., and the season later than for years. Minnesota mills will use all the wheat crop of the State. Rates on flour to this city averaged 80c. from Minneapolis. It is estimated that the wheat area will exceed that of last year by 300,000 acres.....The latest advices from the great cattle ranges of the West published in the Pioneer-Press, Globe-Democrat, Chicago Inter-Ocean and other leading Western papers, go to show that previous reports of the mortality among the herds and flocks on the great plains were very considerably exaggerated. The loss has been unusually heavy, 'tis true, but not so ruinously severe as earlier reports declared..... .....Mississippi has been visited by another destructive tornado that swept all before it for a space of some 200 to 300 yards in an easterly and westerly line passing near Hernando.

The Department of Agriculture's report of crops, etc., just published, includes reports received until April 1. These show an increase of nearly four per cent. in the area sown in Winter wheat. Kansas and Missouri show the largest increase; Ohio and Illinois a slight increase and Pennsylvania remains the same as last year. Indiana, Kentucky, Tennessee, and Virginia each report some decrease. Owing to the prevalence of snow at the date of the returns, the condition of the crops was not given in large portions of the principal wheat-growing States, but wherever mentioned, it was stated as below the average of last year. The alternate freezing and thawing during the month of March was the most detrimental of any weather during the Winter. The live stock of the country, notwithstanding the scarcity of food caused by the long and severe Winter, has come out in fair health, though reported as very low in flesh. No malignant or prevailing disease is reported over any large extent of country. Disorders of the lungs and stomach are often mentioned. Great losses from cold and exposure are reported from the plains of the far West.

There is still quite a free movement of Grain down the Mississippi, as the shipments from St. Louis last week were, for New Orleans, 146,417 bushels of Wheat, 210,328 bushels of Corn and 12,057 bushels of Oats. The export movement from New Orleans for the week comprised 205,778 bushels of Wheat and 250,820 bushels of Corn for Europe.....Rail freights from Western ports on grain have been reduced on the basis of 25c. per 100 pounds for Chicago to the seaboard, and on provisions to 35c. per 100 pounds on the same basis .....An early opening of the lake and canal navigation is not expected. The Straits between Lakes Huron and Michigan are usually opened about May 1. The time for the opening of the Erie Canal will be determined by the time of resumption of navigation on the lakes. The River St. Lawrence is believed to have already opened as the ice was cleared from it a day or two since, where the waters of Ontario debouch into it.....

Last Tuesday, the 12th inst., a considerable number of men interested in the culture of sorghum sugar cane and the manufacture of sirup and sugar therefrom in this State, met at Utica, and it was decided to organize a State association to be called the New York State Sugar Growers' Association. A committee was appointed to draft a constitution and by-laws, and directed to report the same at a larger meeting to be held at Bagg's Hotel, Utica, on April 22, when the topics of growing, gathering and handling the crop, as well as the best sort of machinery and processes of manufacture, will be discussed by different persons well acquainted with the various topics. This will be an interesting meeting, and all our readers interested in the matter, who can conveniently do so, should attend it.....An English company is to be formed, under the name of the Anglo-American Agricultural Co., for "the purchase, stocking, development, re sale and letting of lands in Russell, Marion and McPherson Counties, Southern Kansas, and of other desirable lands, and for making loans upon the security of improved farms," etc. President, Lord Dunmore; manager, M. G. Clapp; capital, $5,000,000 in 200,000 shares of $25 each. It is proposed, however, to call up only $5 per share, so that the actual capital will be only $1,000,000.

The Mohawk Valley Beet Sugar Company is the name of an association that started to establish a beet sugar factory at Schenectady, N. Y. It tried to get that costly machinery from the exploded Franklin, Mass., factory, but failed, so it has resolved to defer the enterprise for a year and will cancel its contracts with farmers for raising beets. It is proposed to get up a capital of $200,000. Dr. Blackwell from Portland, Me., is the prime mover in the scheme; but why he should expect to succeed in New York in an enterprise that failed in Maine, after a protracted struggle, is not apparent.

Beatty's Parlor Organs.

Attention is called to Mayor Beatty's large organ advertisement which appeared in our last issue. He refers to the following well-known and reliable parties who have purchased and are using his instruments, and who will cheerfully testify to their unrivaled qualities. Among many thousands may be mentioned the following:

Boston, Mass.—Moses A. Dow, publisher Waverly Magazine; G. H. Hart, shoe manufacturer, No. 99 Pearl street. New York City—I. W. England, publisher Sun; J. L. Everett, Cashier National Broadway Bank; G. W. Sickles, (Major-General Sickles's father,) No. 111 Nassau street; Bauer & Betz, brewers, No. 140 East Fifty-eighth street. Philadelphia, Penn.—William Underhill, Cashier Mechanics' National Bank. Pittsburg, Penn.—L. Halsey Williams, Cashier Fifth National Bank. Willimantic, Conn.—Henry F. Royce, Treasurer Willimantic Savings Institution. Newark, N. J.—Right Rev. Father Patrick Leonard, (St. Michael's Cathedral) Plainfield, N. J.—J. R. Vandeventer, President First National Bank.

In addressing the above-mentioned gentlemen, readers of our paper should inclose a stamped envelope for reply.

Refined Women.

Refined and Educated women will sometimes suffer in silence for years from kidney disease, or constipation and piles, which could easily be cured by a package of Kidney-Wort. Druggists sell both dry and liquid.—Home Journal.

Women that have been given up by their dearest friends as beyond help, have been permanently cured by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. It is a positive cure for all female complaints. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 50 cents per box.

You can save Doctor bills and keep your family always well with Hop Bitters.

Premature Loss of the Hair

May be entirely prevented by the use of BURNETT'S COCOAINE.

THE superiority of **Burnett's Flavoring Extracts** consists in their perfect purity and strength.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, April 16.

Chicago.—Winter rates of storage expired Saturday, the 16th, and Summer storage began. All deliveries are made on a basis of 1½c storage, with five days to run. WHEAT—No 2 red Winter, $1 02 cash; No 3 Chicago Spring, 93@97c.; rejected, 75@82½c. CORN steady at 42¼@42½c. cash; rejected, 41c. OATS fairly active and a shade higher at 34@34½c. cash; 35¾c. May and June; 34½c. bid July. RYE strong at $1 20¾. BARLEY strong at $1 03. PORK strong at $17 75 cash. Lard strong and higher at $11 23 cash; $11 27½ May; $11 37½@11 40 June; $11 47½@11 40 July. Bulk-meats strong; shoulders $5; short rib and short clear, $8 80. BUTTER—Choice to fancy creamery 29@30c @ lb; fair to good do 26@28c; fine fancy dairy 23@25c; good to choice dairy 20@23c; medium to fair dairy in shipping lots $14@16c; ladle-packed, good to choice 15@17c; fair to the best packing stock 12@14c; grease butter 8@9c. Fair to choice roll butter sells at 14@17c. CHEESE—Fine cheddar creams at 14c ₱ lb in a small way, and at 13c for car or shipping lots, and the only slightly skimmed flats at 9½@10c, but with the poor and the heavy skims dull at 8@8c for a fair quality to 4@5c for the refuse. EGGS—Sales were generally at 18@19c ₱ doz, the demand being quite good. HAY—No. 1 timothy was quoted at $15@16 ₱ ton; No. 2 at $13@14; mixed do at $12@13; upland prairie at $12 50@13 50; No. 1 prairie at $9@10; No. 2 do at $7 50@8 50. Small bales sell for 20@50c @ ton more than large bales. SEEDS—Good to choice medium clover at $4 50@4 75 ₱ bush; mammoth do. at $4 75@5 10; good to prime timothy at $2 45@2 50; choice do at $2 55@2 56, and flax at $1 17. WOOL—Dealers still report a slow trade in all grades and qualities, and prices rule easy and in buyers' favor. For assorted lots from store we quote Eastern Iowa, Wisconsin, and Illinois wools as follows: Tub-washed, bright 40@50c ₱ lb; do dingy and coarse 41@43c; fleece-washed medium 39@41c; do fine 35@39c; do coarse 33@36c; unwashed medium 32@34c; do coarse 25@27c; do fine bright 28@28c; do heavy 18@25c; buck's fleece 16@18c. Consignments from western Iowa, Nebraska and Kansas sell at about 2½@5c less than this range, and burry and poor-conditioned lots at 3@10c less. New Mexico wool (unassorted) is quoted at 22@26c ₱ lb for medium to fine; coarse to medium 18@22c, and black at 19@22c.

Cincinnati.—CORN No. 1 mixed 47½c. OATS dull; No. 2 mixed 41c asked, 40c. bid. RYE easier; No. 2 $1 34½@1 35. BARLEY quiet and nominal; No 2 Fall $1 10. PORK active and a shade higher; held at $17 75. Lard firm at 11½c. Bulk-meats higher; shoulders 5⅞b; clear rib 8½c; bacon active and a shade higher; shoulders 6¼c; clear rib 9¼c. Bacon—clear rib 9¾c. Hogs quiet and weak; quality poor, common $4 35@5 25; light and medium $5 50@6; heavy packing $5 35@5 65; butchers' selections $6@6 25. Butter weak and declined 1@2c; choice Western Reserve 24@25c; choice Central Ohio 20@32c. SUGAR steady and unchanged. Prices have about the same range as last week but a better grade is obtained for the same price, which is equivalent to a decline of 2@3c. per pound; the grade selling at 28c. a week ago will not bring over 25c, and anything bringing 28c. has to be really fine—almost as good as Creamery. Medium and low grades are dull and drooping. Fancy Creamery sells at 35@36c, prime do. at 30@33c. choice Dairy at 26c@28c, choice Western Reserve at 25@27c. prime to choice Central Ohio at 20@21c, and common to medium do at 15@18c, per pound. CHEESE cured factory at 13c, and prime Northwestern at 11½@12c per pound while inferior ranges down to low prices. HAY, Common sells at $18@19 prime do at $20@21 per ton, and Prairie hay at $12 50@13 50 per ton in bales on arrival. Wheat and Rye straw is steady at $8@8 50, and Oats straw firm at $9@9 50. MILL FEED.—Bran sells at $14 50@15, shipstuffs at $15 50@16, and middlings at $16@20 per ton in bulk, and 50c. more in sacks on track. SEED.—Prices of Clover and Timothy are lower the last week. Prime to choice Clover sells at 7¾@8c per pound, and Timothy at $2 65@2 75 per bushel from store. Round lots on arrival would not bring these prices. Flaxseed is steady at $1 10@1 12½ per bushel. German Millet sells at $1 50, common Millet at $1 25, and Hungarian Grass at $1 00@1 10 per bushel.

St. Louis.—WHEAT dull; No. 2 Red Fall, $1 08⅛ @$108¼, cash and April; $1 07⅞@1 08¼, May; $1 07⅞@1 07⅞, June; $1 03¼@1 03¾, July; $1 01¾, August; $1@1 01¼, all the year; No. 3 do., $1 04¼

@$1 04¾; No. 4 do., 98¾@99c. CORN, 41¾@41⅞c., cash; 41¾@41⅞c., April; 41¾@41⅞c., May; 41¾@47⅜c., June; 42¼@42¾c., July. OATS, 35¾c., cash; 35¾c., April; 35@35¼c., May; 35¾c., June. 33¾@34c., July. RYE, $1 36 bid. BARLEY quiet at 75¼c@$1 10. PORK, $17 75, cash; $18 20 asked, May. Lard higher at $11 20. Bulk-meats strong and higher; Shoulders, $5 50; Clear Rib, $8 60; Clear Sides, $8 85. Bacon higher and firm; Shoulders, $6 25; Clear Rib, $9 25; Clear Sides, $9 50. POTATOES—Choice N. Y., Peerless 85@87½c., Rose 90@91c., Burbank 93@95c., Peachblow 95@97½c., Western at 50@60 for inferior and dry-rotted to 75@85c for choice. ONIONS—Prime at $3 75@4 ₱ bbl or $1 65@1 70 ₱ bush; sprouted and damaged nominal at $2 75@3 per bbl. Sale part car Eastern red in sks at $1 65 per bush. WOOL—Quiet. Prime medium 25@26c for unwashed and 39@41c for washed; poorer grades proportionately less. Sale small lot tub 39c. SEEDS—Hungarian firmer at 70@75c; others quiet—German Millet $1 10 to $1 30, Clover, at $4 75@4 80, common Millet at 80@90c; Redtop do at 45@47c. Timothy $2 25 for inferior to $2 50 for prime; Orders are charged higher.

Fertilizers.

Mapes' Potato Manure, $50; Corn do, $50; Fodder Corn do, $47; Beet and Mangold do, $50; Cauliflower and Cabbage do, $49; Sugar Cane or Sorghum do, $47; Asparagus do, $52; Tobacco do, $53; Complete do, (for light soils) $53; Complete do, $52; Grass and Grain Spring-top Dressing, $52; Fruit and Vine Manure, $37; Lawn Top-Dressing—full strength—free from odor, $60; Lawn Top-Dressing (with plaster), ready for use without further mixing, $35; Potato Manure, (Ville Formula, $48 50c; Complete do. (Ville Formula) $49; Complete do, ("A" Brand) $42; Nitrogenized Super-Phosphate of Lime, $38; Nitrogenized Superphosphate of Lime, (with potash) $40; Ammoniated Dissolved Bone, (Moosehead) $36; Potash Bone Phosphate, $37; Ground Dried Fish, (8 to 16 per cent,) $40; Ground Dried Fish, (with phosphoric acid and potash added) $40; Prepared Fish Guano, $4 ; Pure Ground Bone, Medium, $36; Pure Ground Bone, Fine 38; Pure Ground Bone, Extra Fine, $40; Pure Ground Bone, Meal and Extra Fine, $41; Pure Ground Bone, for Feeding Stock, (in barrels about 200 lbs. each) $50; Muriate of Potash, 80 per cent, bags about 200 lbs each, $42 per ton; Kainit, or German Potash Salts, 24 per cent., bags 200 lbs each, $15; Sulphate of Ammonia, (barrels about 250 lbs) per lb, 4@5½c; Nitrate of Soda, 95 per cent—per lb, 4@4½c. All Chemicals subject to fluctuations.

BAUGH & SONS, Philadelphia, Pa.—Baugh's Twenty-five Dollar Phosphate at $25 for 2,000 lb; Baugh's Economical Fertilizer at $30 for 2 000 lb; Baugh's Raw Bone Super-phosphate at $38 for 2,000 lb; Baugh's Special Tobacco Fertilizer at $38 for 2,000 lb. All delivered on the cars or on the boat in that city.

PRICE LIST OF STOCKBRIDGE MANURES AND BOWKER'S PHOSPHATES.—For potatoes and roots, $50 per ton; corn and grains, $50; for strawberries and small fruits, $40; for grass, top-dressing, $50; hill and drill phosphate, $45; Bowker's phosphates, $40; Brighton phosphates, $38; soluble bone, $35; pure steamed bone, $40.

[Attleboro Chronicle.]

Carry the News.

Mr. John Eizensperger, manufacturing jeweler of North Attleboro, Mass, lately communicated to us the following: I suffered so much with pains in my arm, that at times I was completely helpless, I used that incomparable remedy St. Jacobs Oil and was completely cured as if by magic.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 16, 1881.

BEANS AND PEAS.—There has been a sharp sudden advance in beans, and the new prices are supported with sales. Mediums and marrows hold the trade and prices for the other sorts are more or less sympathetic with the standard white. Green peas slow at $1.50. So. II. C. peas better; now $2.75@3 ₱ 2 bu, bag.

Medium and marrow beans, prime, $2.15@2.50; other $2.25@2.30; white kidney and pea $2.30@2 35 red kidney, prime $1 50@1.60, other, $1.40@1.50; black or turtle soup $1.40; Lima, $5@5.50.

BEESWAX.—Demand is small but offerings light and prices firm. Sales at 25@35½c.

BUTTER.—Receipts of new are quite liberal and as supplies from this out will continue free, buyers operate cautiously in view of obtaining the first invoices of improved quality that will soon appear. Prices are off from last week's rates for new and are very reasonable for old. The latter are down to figures that decidedly favor buyers, and of course are not paying ones to owners.

New Butter.—Creamery, choice Western and Pa. 31@33c, other 27@30c; sweet cream, 28@32c.; State half tubs, choice, 26@27c; fair to prime, 20@25c. Welsh, choice, 25@26c.; other 20@21c.; very common or state new 15@18c.

Old Butter.—State dairies, 13@20c.; pails and half tubs, 18@22c; Welsh, 18@19c.; fine Western, 23@24c.; fair to good, 12@20c; very poor. 12@13c.

Receipts for week 21,715 pkgs.
Exports do. 810 do.

CHEESE.—Export demand is moderate and the home trade is fair with prices firm and on choice stock a little higher. Quotations are for

Fancy at 13½@14c.; fine, good and prime, 12¼@13¼c.; do. fair, at 12@12¼c.; do. half-skimmed, 8@9c., Wisconsin factory, fine, at 13¾@13¾c.; do. good to prime, 12¾@12¾c.; do. fair to good, 11@12c.; Ohio factory, fine, 13@13¾c.; do. good to prime, 11¾@12¾c.; do. fair to good, 10¼@11½c.; do. poor to fair 8@10c. Skimmed creamery, 5@7c.

Receipts for week, 8,339 boxes.
Exports for week, 11,125 boxes.
Liverpool cable, 60s.
Steam to Liverpool, 21s.3 d.@25s.

COTTON.—The market is quiet and varying slightly only, closing at for

April, 10.61@10.65c.; May, 10.69@10.70c.; June, 10.77@10.78c.; July, 10.8 @10.86c.; August, 10.91@10.92c.; September, 10.70 @10 61c.; October, 10 22@10 23c.; November, 10.10@10.12c.; December, 10.10@10.12c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*N. Orleans and Gulf.*	*Texas.*

Good ordinary	6 9-16	Low middling	8¾
Strict good ordinary	7 11-16	Middling	10

Receipts for the week, 20,317 bales, Exports do. 12,479 do.

SEED.—Clover is quiet at 8¾@9 for Western. Timothy is slow at $2.80@3.00.

DRIED FRUITS.—Apples have shown a good trade in evaporated, for which prices are slightly better; low grade of sun dried are in good demand for export; other qualities are dull and unchanged. Peeled peaches are scarce and firm. Small fruits are in small supply and generally strong. Quotations are for

Evaporated apples at 8@8¾c. for prime and choice stock; sliced apples at 4¾@5¾c. for good to choice North Carolina; 4@4¾c. for Va. apples, 4@4¾c. for Tenn do, 4¼@4¾c. for State do; 4¼@4¾c. for western, Ohio and Mich. Peaches at 28@29c. for evaporated peeled; 18¾c. for unpeeled do.; N. C. peeled at 19@20c.; for the better qualities, unpeeled peaches at 5¼@5¾c. for halves and 5¾c. for quarters. Plums at 15@16c. Blackberries at 8½@8¾c. for prime. Cherries at 16¾@17c. Raspberries at 28c. Whortleberries 10@11c.

Receipts for the week, all kinds, 1,033 pkgs.
Exports dried apples, 3,364 pkgs.

EGGS—Receipts for week, 21,073 bbls.; do. last week 18,818 do. Supplies are light and sellers are obtaining unusually high prices for Easter week. There will be no material surplus after Sunday but eggs will lose some of their special call and prices as quoted will not be sustained,

Near points, 20c.; State and Pa., 19¾c.; Western, 19¼@19¾c.; Southern, 19@19½c.; poorly packed and small run 17½@18¼c.; goose 45@48c. duck, 30@33c.

FLOUR.—The low grades are in active demand and well sustained in price; medium grades are favoring buyers; best lots of patent are wanted at firm prices.

Latest prices are; $3.70@4.35 for very inferior to choice superfine State and Western; $4.40@4 65 for poor to choice extra State and Western, odd lots and lines; $4.65@4.75 for choice to fancy do.; Inferior to good white wheat, trade and family extras, $4.30@5 40; good to choice do at $5.40@6.25; (very choice up to $6 35@6.50 and fancy at $6.50@6.75;) red and amber winter wheat inferior to choice trade and family at $4.60@6.15; round hoop Ohio, $4.50@4 85 and trade and family brands of do. at $5.00 @6.25, the latter for very choice: St. Louis $4.75@5 75 for inferior to good extra; $5.75@6.50 for good to choice, and up to $6.75@7 for very choice to very fancy brands; Minn. clear inferior to very choice at $4.40@5 85; Minnesota "straight," poor to very choice, at $5 35@6.75, and patent inferior to fancy at $5.75@8.15; city mill extra at $5.60@5.65 for the West Indies; do. for England at $4.40@4.75 for poor to choice spring wheat; do, trade and family extras $5.70@6.75; do. for South America $5.75@6.00, the latter for very choice; No. 2 at $3 00@3.70 for very inferior to very fancy.

Receipts for week, flour, bbls. 127,150 corn meal, do. 2,878; wheat, bush. 849,900; corn, do. 612,200; oats do. 256,050, rye, do 27,385; malt, do. 18,900; barley, do. 24,550; beans, do., 4 776; rice, pkgs. 900.

Exports for week, flour, bbls. 62,500; corn meal, do. 1,779, wheat, bush 889,100; corn, do. 810,700; oats, do. 1,325; beans, pkgs. 300, rice do. 550.

FRESH FRUITS.—Exports of apples for week, 6 000 bbls. The market is rather more active for prime red, but these are in few hands. The closing prices of the season will make up losses for many large operators this time. They have had to fight against inferior shipments abroad which has competed with one of their outlets besides the long unfavorable selling weather has prevailed in this country.

Choice red $2@2.25; good other $1.50@1.75; poor $1. Cranberries lower with a pressure to sell, N. J. crates quoted 80c@$1.50. Fla. oranges are in demand for special fruit stores; but the general trade that was needed and expected for as large a crop as the last does not and now cannot improve. The range as before is $1.50@3 for good to best half barrel cases. Fla. strawberries plenty and lower. Chas. are included in the offering at 45@60c. per qt.; hothouse Black Hamburg grapes $4@4.50 per lb. Peanuts are nearing a season for sales and prices are named with some confidence though the supply is large. Va. hand-picked 4¼@4½c; good to extra prime 3@3¾c; shelled 3@3½c; pecans lower 7@7½c.

CORN-MEAL.—Sales at $3.10 for Brandywine and $2 65@2,80 for yellow Western.

GRAIN.—Wheat has been active and variable according as the crop reports have been favorable or otherwise, but on the whole not much advance obtained for the week. Latest prices are—

No. 1 white at $1.20@1.21. do. April at $1.19¾@1.19¾; do. May at $1.17¾; do. June at $1 16¾@1.17; No 2 white at $1.19@1.19¾; ungraded white at $1.19; mixed Winter at $1.19¼@1 19¾; No. 1 red at $1.27@1.28½; No. 2 red at $1.23¼@1.23¾; do. April at $1.21¼@1.21¾; do. May at $1.20¾@1.20¾; do. June at $1. 9¾@1.19¾; do, July at $1.17¾@1.18 No 3 red at $1.19@1.19¼; ungraded red at $1.18½@$1.27¾; New York No. 3 Spring at $1.14@1.16.

Rye at $1.08@1.11.

Corn is higher on a short interest here and at Baltimore; latest sales are

New York No. 2 at 58¼@58¾c.; do. April at 57½@58¾c.; do May at 55¾@55¾c.; do. June at 54¾@54¾c. do. old crop in store at 60c.; No. 3 at 54@54¼c.; ungraded mixed Western at 54@55c; New York steamer mixed at 56¾@56¾c. closing at 56¾c; No. 2 white at 60c.; white Southern at 60@60½c.; steamer white at 57@57½c.; low mixed at 59c.

Oats have a fair trade demand and prices firm; latest sales are of

No. 1 white at 48½c.; New York No. 2 white at 46¾@46¾c.; No. 3 white at 45¾; New York No. 2 at 44¾@45c.; do. April at 44½c.; do. May at 44¾; do. June at 43¾. No. 3 at 44¾@44¾c.; ungraded white Western at 43@49, ungraded mixed Western at 44@46; white State at 48@50, mixed State 47, No. 2 Chicago at 44¾.

HAY AND STRAW.—Low grades of hay are less wanted, and as they are still plenty prices are weak. Prime hay and straw have considerable demand and prices strong. Quotations are

Hay, prime timothy at $1.15@1.20 ₱ 100 lbs.; medium timothy at 95c.@$1.05 do., shipping grades at 85@90c. do.; clover mixed at 25c.@$1.00, clover at 80c@90. do. Straw—No. 1 rye at $1.10@1.15 ₱ 100 lbs.; No. 2 rye at 70@75c, do.; oat and wheat at 50@60c. do.

Exports for week, 1,434 bales.

HOPS.—Export demand continues slack and the brewers buy very moderately, with prices generally steady. Quotations are for

	Cents per lb
New Yorks, crop 1880, choice	23 @23
Do. medium	19 @21
New Yorks, crop 1880, low to fair	12 @15
Eastern, crop 1880	14 @22
Wisconsin, crop 1880	14 @22
Yearlings, crop 1879, choice	12 @18
Olds, all growths	4 @10
Pacific coast, new	19 @25
Bavarians	30 @35

Receipts for week, 734 bales.
Exports do., 174 do.

MAPLE SUGAR.—Supplies are small, but there is enough here to keep prices tame. Sugar 8@10c; for State and Western; Vermont, 12c. Sirup, 10@11 ₱ cans, 75c@$1. inc. package.

OIL-CAKE.—Western is quoted at $23.50@29.75 per ton.

POULTRY AND GAME.—Continued high prices for dressed have restricted even the moderate Spring demand; holders, however, still quote strong figures and the weather is favorable for holding. Capons are in large supply for that style of dressed and are easier.

Turkeys, choice, 17@18c; fair to prime, 15@16c.; Phila. broiling chicks, as to size, 30@40c; do. roasting, 23@25c.; N. J. 18@21c. Phila. fowls, d. p. 15@16c; N. J. 15@17c.; State and Western 15@16c.; fair lots, 14@15c.; Capons, large, 27@28c.; small and slips, 23@25c. Ducks, choice, 20@22c.; other, 15@18c. Geese, 10@12c. Squabs, white, $3 ₱ doz.; do. dark, $1 50@1.75

A few coops of Winter chicks have made 15@25c. ₱ lb. The demand has slackened, but prices are firm with no prospect of heavy supplies.

Fowls, 14@15c.; roosters, 8@10c.; turkey hens, 13@15c.; do. toms, 14@16c; ducks, 75c@$1.25 geese, $1.50@2.70 pigeons, 35@45c.

Game receives little attention; low-priced wild pigeons, usually plenty at this time, are not in stock.

Sand snipe, 40c. ₱ doz.; Eng. snipe, $1.25@1.50; plover $1@1.25; Canvas-back ducks sold at 50c.; other ducks range 20@50c. The season winds up May 1st.

PROVISIONS.—Hog products have been in good demand and advancing.

Mess pork quoted at $17.40@17.60; do. for May at $17.40@17.50; do. for June at $17.60; do. for July at $17.80. Bacon at 8¾ for long clear and 9¾ for short clear. Beef hams at $21@22. Western steam lard at 11 47½@11.50 for spot lots, 11.47½@11.50 for May, 1 ,52½@11.55 for June, 11.57½@11.60 for July, and 11 62½ for August. Stearine at 13¾@12¾. Tallow at 6 7-16@6¾.

Receipts for week, beef, bbls. and tcs., 790 pork, bbls. 1,072; cut-meats, pkgs. 18,300; lard; do. 12,4 0.

Exports for week, beef, bbls. and tcs., 1 250 pork, do. 3,835; cut-meats, lbs. 4,600,000; lard, do. 3,736,960.

VEGETABLES.—Supplies of potatoes are moderate and with the strong advance in beans and the receding of other vegetables prices are very strong The run is upon one quality especially as there is a good deal of seed buying for neighboring garden patches.

Bermuda potatoes $9@10 ₱ bbl.; 2d crop $7@7.50; Early Rose, Nova Scotia d.-h. $2 75@3 87. Maine $2 62@2.87. State, $2.40@3 75; do. bulk, $2.37@2 62. Peerless, $2.25@2 37; Mercer, $1.87@2 Jackson White, d.-h., $2.12@2.37; Burbank, d.-h. $2 50@2 75; do. bulk, $2 10@2.62, Snowflake, $2.37@2 62. do. d.-h. $2.50@2.75, peachblow do. $2.00@2.12; Peerless, $2@2.12; sweet dull $1.50@2.

Southern supplies of green stuff are of irregular quality: quotations are only for prime showy lots. Bermuda produce arrives freely.

Fla. green peas per crate $1@4; Sav. do. $4@5; Fla. tomatoes, $1@3 ₱ crate; Bermuda do. 5-qt boxes, 50@90c; Fla. string beans, $3@3.50 ₱ crate; Bermuda beets $2@2.50 ₱ crate; do. onions, $3.25 ₱ crate; Norfolk Spinach, $3@4 ₱ bbl.; do. kale, $1.25@1 75; do. radishes, $1@1.50 ₱ 100 bunches; Chas. asparagus $6 50@7 50 ₱ doz.; cabbage, $4@8 ₱ 100.; lettuce; $2.50@4.50 per bbl.; cabbages, $2.50@4 ₱ bbl, old crop; cabbage ₱ 100 $1@3 Hubbard squash, $1@1.25 ₱ bbl., marrow do. $1@1.25; onions, white, $3@3 ₱ bbl.; other in bulk, $3.25@3.50; carrots, $1@1.75; celery $1.50@2.

TOBACCO.—Export demand is moderate and the home trade fair, with prices firm. Quotations are for

WOOL.—The market has not varied materially this week, with holders disposed to meet buyers promptly and purchasing moderate.

LIVE STOCK MARKETS.

NEW YORK, Saturday, April 16, 1881.

BEEVES.—Receipts for the week 11,573 head; do. last week 13 05 do. Strong prices still rule and though buyers begin to demur loudly and savagely at the high rates, the situation of the markets here and West support sellers' views. Good Cherokee stock sold at 10½c. to dress 54 lbs, less $1 ₱ head; even rough steers and oxen sold at 8¾@9¼c. to dress 55@56 lbs. Twenty fancy Illinois steers sold at 12¾c. to dress 58 lbs; other sales of native range at 10c. to dress 54 lbs. to 11¼c. to dress 57 lbs. for common to very good steers.

MILCH COWS.—There has been quite an offering of common to good milkers quoted, with sales at $30@55 per head. A dozen imported Holstein cows and heifers were taken to Havana.

VEAL CALVES.—A couple of wet days kept back supplies and the market has ruled stronger than at our last. The most advance has been in under grades.

Live choice fed 7¼c; fair to prime 6@7c.; poor 5@5½c. Mt. Holly, 5@8c; buttermilk 3@4c. hog dressed calves extra 10¼c fair to prime 7¾@10c; poor 5¾@6¼c.

SHEEP AND LAMBS.—Receipts for week, 19,141 head; do. last week 15 84 do. Supplies have run very light and prices have only a seasonable strength. Unshorn sold at 6¼@6¾c; clipped 5¾@5¾c. Spring lambs 7@8c per head with a good demand for Eastern.

SWINE.—Receipts for the week, 19,554 head; do. last week 21,188 do.

Live corn fed $5@6 per 100 lbs.; country dressed pork light, 8¼@8¾c.; medium, 8@8¼c.; heavy, 7¾c.; city dressed Western, 7¾@7¾c.

Reading for the Young.

FARMING FOR BOYS AND GIRLS—NO. 19.

HENRY STEWART.

Rotation of Crops.

WHY does a farmer change the crops of each field every year, growing first clover and grass and then corn, then oats, and lastly, wheat or rye, and again seeding down to clover and grass? It is because he knows that these crops succeed better when thus grown and that he cannot grow the same crop every year on the same ground, with profit. There is a good reason for this. It is because the nature of each of these different crops is not the same; that one seems to rest the soil, that clover actually leaves the soil better than it was before, besides adding to it in the shape of roots, stems and leaves, a large quantity of valuable plant food for the corn which follows it; that the culture of the corn kills a vast quantity of weeds and cleans the ground, and prepares it for the oats and wheat; that after the oats have been grown the soil has given up to that crop all the strength it possessed, and that it then requires help to restore it. This is given by the manure and fertilizers used to prepare for the wheat or rye and the clover and grass after it, and that by this treatment one can go on year after year, for a whole life-time, growing crops and then leave his farm still fertile and useful for his children, who may do the same, to be followed again by their children.

This method of culture is called the rotation of crops, and the usual rotation consists of the four crops mentioned, viz., clover and grass, corn, oats and wheat. This is called the four course system. Some farmers add other crops and so lengthen the course with great benefit to the soil; because in the four course system there is too much grain and too little fodder for feeding cattle and making manure, without which good crops cannot be grown. There are also not enough of the renovating crops, as those are called, in which either the soil is manured or rested, and restored, or in fact renewed in strength and power to produce the other crops which take more from the soil, and are therefore called exhaustive. For the principle at the bottom of this system of rotation is chiefly this: that the farmer must follow an exhaustive crop with a renovating one; that is, one that is hard or difficult to grow with one that is easy, and so give the soil an opportunity to recover before its strength is taxed too much.

Much injury has been done to many farms by an unwise neglect of this precaution and crops of wheat and corn have been grown year after year, until the soil has been made unable to produce enough to pay the farmer for his labor, or to support him and his family with comfort. It is in this way that farms have been worn out and people have been forced to go further west to get new land, that the same wasteful practice may be followed. Now that the west is becoming filled up and the best lands are occupied, this can no longer be done, and farmers are obliged to follow a more skillful practice and are forced to study more carefully the nature of their business that they may make their farms more productive.

The feeding of cattle and sheep is the most important part of the farm work and the growing of feeding crops therefore needs to be made a special study by the young farmer. A rotation then which can be made to include the largest number of feeding crops is the best. A seven course rotation is sometimes practiced in which clover and grass are grown one year for hay and a second year for pasture followed by corn, oats, roots (either turnips or mangels) barley, clover for hay, and wheat on the clover sod, followed by grass. This rotation has many advantages. It has two cultivated or cleaning crops, corn and roots; two sods plowed under, and four feeding crops, viz., corn, roots and two hay crops. Where it can be followed it enables the farmer to keep a flock of sheep or to keep cows and a dairy which is one of the most profitable and pleasant parts of farming, and gives the girls an agreeable opportunity of adding to the income of the farm and to their own resources, by making butter, as well as finds employment for the boys which is not so laborious as the constant raising of grain. When the rotation is chosen, the farm is divided into fields to suit the course, five for the four course, in which there are two in grass at the same time; and eight for the seven course rotation.

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

ALICE P. ADAMS.

The Water.

"I am so thirsty," said Daisy one morning, as she took a cup to the hydrant in the kitchen sink.

"Oh, come out to the *olla* and get your drink," cried Violet. "The water is so much cooler there than it is in the pipes."

So Daisy followed, obediently, to the wood-shed, though, as she afterward said, she had not the remotest idea whether an *olla* belonged to the animal, vegetable, or mineral kingdom. It proved to be a huge dark-red jar which was set in a wooden frame work and covered closely. Violet lifted the cover and dipped up a cupful of water for Daisy. "How nice and cool it is!" she cried as she drank hastily. "But what a queer arrangement for water!"

"So I thought when I first saw one," replied Violet, "but I don't know how we could get along without ours. We don't use it much in Winter, but in Summer the water in the pipes gets so warm that it isn't fit to drink unless you let it run a long time, while that in the *olla* is almost as cold as ice-water."

"Don't you have ice here?"

"Oh, yes; they make it in Los Angeles; but we have never used any, and you will be surprised to find how little we miss it."

"But why should the water be any cooler here than in a pail?"

"Because the *olla* is very porous, and if it is where the breeze can strike it, the water is cold. That is all I can tell about it. If you want more philosophy ask Bert or papa."

"Why don't you have it down on the ground?" inquired Daisy, who was curious to learn about this strange earthen vessel which made ice-water needless when the mercury stood far up in the nineties.

"Because the bottom is round and it won't stand up alone. The Mexicans make them in all sizes, from the little ones that hold a pailful to those as large as this, but they are all made after the same pattern. Some people suspend them from the limb of a tree, and claim that the water is cooler, as the *olla* is set in motion by every breeze. But ours is so large that that plan would not be practicable. I suppose it is because the ware is so porous that they break easily," continued Violet, as she pointed to the top of the *olla*, where a piece was broken from the edge. "That is some of Bert's foolishness. Boys think they know so much! Bert said it was not in a good place, and the water would be ever so much cooler if it was changed; so he undertook to move it alone one day, and the result was that he hit it against something and nicked that piece out. And the fun of it was that when papa found it out he had it taken back to its old place, so my learned brother had his trouble for nothing. But don't stay in the wood-shed all the afternoon when it is so much pleasanter outside. I know—let's go up to the reservoir; you haven't been there yet."

"Very well; only tell me the name of this jar once more."

"*Olla*; and you pronounce it in this way, *ol-ya*."

"*Ol-ya, ol-ya*," repeated Daisy, as the two girls went into the house for their hats.

"Where does all this water come from?" she asked a few minutes later, as they slowly walked along.

"From springs in the hills over there," answered Violet, pointing to the range of foot-hills seemingly at the base of the mountains, though in reality miles of uncultivated land intervened. "The stream flowing from the spring is piped to the reservoir, and from there to the different places on the Alhambra. And the water is so nice and soft, I don't think you could find better if you searched the State over."

They soon reached the reservoir which was circular in form, and nearly full of water. The bank of earth which surrounded it was flat on top, and up the girls climbed for a walk around the basin.

"People often think that is an artesian well in the centre, but it is only the water flowing from the main pipe that supplies the reservoir. There is the waste-pipe at the side, and you can see the water is nearly up to it."

"How much trouble it saves having the water piped into the house."

"Yes, there it is in the kitchen and bath-room and all we have to do is to turn the faucet. In this respect, we are better off than in the East, for there we pumped water from both the well and cistern; and yet some of our friends imagine we live in the backwoods, and pity poor Mrs. Erman who is wearing out her life in that uncivilized country!" concluded Violet with an upward turn of her nose.

"They had better bestow their sympathy on some one who needs it," laughed Daisy.

"But you mustn't imagine that all the people in Southern California have the water piped in their houses. In many places it runs for miles in open ditches or *zanjas*, as they are called. And then the people have such a time with the water in Summer. They have to take it when they can get it, whether or not it suits their convenience. I know a gentleman who had to irrigate on Sunday because his turn happened to come that day; but it certainly was a case of necessity, for a great many of his trees were wilting, and it would have been four or five weeks before his turn came round again. But the best of it was that he is a minister, and while he was preaching his morning sermon his boys were irrigating; and when he came home he took off his Sunday clothes and went to work with the others. Now, when papa wants to irrigate, it is only necessary for him to notify the *zanjero* a few days beforehand, and when the time comes he opens the hydrants and goes to work."

"Who or what may the *zanjero* be?" inquired Daisy.

"The man who takes care of the reservoirs. There are three besides this one, so I imagine he finds plenty to do. There he comes on horseback, with his shovel on his shoulder."

The girls descended from their lofty post of observation and turned their steps toward Rose Cottage.

"Everything is so beautiful and green now it don't seem possible that in a few months all this will be brown and bare," reflected Daisy, as she pointed to the fields of barley and *Alfileritta*, or native grass."

"You will find it quite possible this Summer," rejoined Violet. "And the reason why is because that land does not belong to the Alhambra, and has no water right. Its owner raises barley on it in the rainy season, but it stands idle in Summer, as he has no means of irrigation. And the Alhambra was in the same condition until water was found for it—good for nothing but Winter crops. A man may own thousands of acres, and yet his property will not amount to much unless he has a fixed water right with it."

Having reached the entrance to their place as she gave utterance to this opinion of weight, Violet challenged Daisy to a race to the barn, where they were going to hunt for eggs. "I declare," she panted, as she reached the door a trifle in advance of her friend, "California air is doing wonders for you! I shall have to look to my steps if I don't want to be left behind!"

OUR SEED DISTRIBUTION.

PROBABLY nearly all of the cousins have now received the seeds which have been sent to them. In the large envelope will be found seeds of the beautiful Japan Red Bud, and also a package of Crimson Dwarf Celery seed. I will give full directions next week as to cultivation.—U. M.

Don't use stimulants, but nature's real brain and nerve food—Hop Bitters.

"FOR ORGANISTS."

ORGAN GEMS. ($2 50) By F. L. DAVENPORT.
ORGAN SELECTIONS. ($1.50) By PETERS.
BATISTE'S ORGAN VOLUNTARIES. $2.50.
BATISTE'S LAST COMPOSITIONS. $2 50.
ORGANIST'S RELIANCE. (10 Nos., each $1.25. Complete, $6.) By EUGENE THAYER.
ZUNDEL'S ORIGINAL ORGAN COMPOSITIONS. ($1.25.)

In these six well-made books will be found a very large number of voluntaries, some classical some new and light, but all good. Organists will be glad to use the longer ones intact, and to adopt the shorter compositions as themes from which to vary.

Billee Taylor, price reduced to 50 cents.
Olivette, price reduced to 50 cents.

Johnson's New Method for Harmony.

($1.00.) By A. N. JOHNSON. "The best book in the world" (for its object), was the commendation bestowed by an enthusiastic pupil on a former book by the same author. However that may be, this is his newest treatise, and can hardly be excelled for plainness of explanation, ease and thoroughness. It does not attempt Counterpoint, or any of the higher problems of composition; but confines itself to those things that every organist, every good player, and every composer of "the people's music," ought to know.

PERSONAL ITEMS.

President Garfield's mother will go back to Mentor in May.

Pincess Dolgouroukl has about $30,000,000 to her credit in the Berlin banks.

Ex-President Hayes is said to be employing his leisure in writing a history of his administration.

Miss Ida Lewis, the heroine of Newport, R. I. who has saved the lives of so many drowing persons, cannot swim.

Mr. M. H. De Young turned his back upon San Francisco as soon as the verdict of acquittal in the Kalloch case became known to him. He is now in Washington.

Mr. Edward Scheffiein, one of the mining millionaires, was once a "mule-puncher" at Tough-Nut, Prescott and other camps. One day while at Camp Huachuca, he announced his purpose of starting out to make a fortune. "Oh, yes," replied a bystander, "you'll find a tombstone." Scheffiein soon afterwards "struck it rich," and named the now thriving camp Tombstone. His first act after making the strike was to settle $100,000 upon his mother.

[Detroit Post and Tribune.]

I have a little girl, said Mr. Henry Dole, of this city, in a conversation, who was troubled with a severe lameness in her legs, pronounced by some Erysipelas, by others Rheumatism. I had tried several remedies without effect, when I was induced to apply St. Jacobs Oil and I am happy to say that the use of but one bottle cured her, and she is now able to go to school again.

Miscellaneous.

BOWKER'S
HILL AND DRILL
PHOSPHATE

SEND FOR PAMPHLET.

This is a true bone superphosphate, and may be used *on any crop*, in the hill or drill or broadcast, either *with* or *without* manure, and will produce a much earlier and larger crop. In the Report of the Mass. Inspector of Fertilizers, its valuation is from $3 to $10 per ton higher than other Phosphates which sell at the same price. The past year over 3000 tons were sold against 100 tons three years ago, showing that it is liked by the farmers. If there is no local agent near you, send to us.

Also for sale OCKBRIDGE MANURES.

Causes of Nervousness.

The maladies which above all others cause nervousness, are dyspepsia, biliousness and constipation. The great sympathetic nerve which connects the epigastric region with the brain, is always injuriously affected if the stomach and bowels are disordered; a permanent derangement of the functions of those organs reacts by sympathy upon the entire nervous system. Hostetter's Stomach Bitters, in restoring tone and regularity to the digestive apparatus, and overcoming constipation, permanently remedy the nervous complaints which originate in alimentary weakness or or disturbances. They are the very best nervine that can be used. By eradicating the exciting causes of nervous weakness, they permanently overcome the disability itself. But this is not all. By checking the maladies which cause nervousness, they build up anew the system weakened and depleted by nervous disease.

Name this paper in application for circular.

The New Sheep Dip!

LITTLE'S CHEMICAL FLUID.

Non-Poisonous, Non-corrosive Disinfectant, and Specific for Scab and Mange, and any skin disease. Ticks, Lice and all insect pests. Worms in the throat and other internal parasites in Sheep and Lambs. Also a Certain Cure of Sore Eyes in Sheep and Lambs.

Is now extensively used in all the great wool-growing countries of the world, and is rapidly superseding all other preparations. In Australia it is the recognized Dip, and in New Zealand it is used in the Government Dipping Stations, and is highly recommended by the principal Sheep Inspectors. In the United States also, although only recently introduced, it is having a large sale, especially in California, and during the last 12 months many thousand gallons have been shipped to that State alone. A large demand has arisen from one end of the country to another, from parties who have satisfied themselves of its merits.

It is before all other Dips in the simplicity of its preparation. It mixes at once with **cold** water, and a single trial will prove that on coming into contact with the water the whole is changed into a milk-white Dip, which is **distinctly not the case with any other material.** May be used in the coldest weather with perfect safety.

Send 2-cent stamp for Testimonials and prices to

PEACHES.

From Notes Taken at Maturity.

T. T. LYON.

BERGEN'S YELLOW is by no means a recent variety. I fruited it in Eastern Michigan more than thirty years since, and found that there it maintained its Eastern reputation for unproductiveness. The cause of this defect, as in the parallel case of the Susquehanna and some other varieties, seems not to be a deficiency of fruit buds; but rather a lack of hardiness, resulting in the winter-killing of a large portion, if not the whole, of the crop, even when most others escape unharmed. The foliage is unusually large, rich and glossy; and the tree very vigorous and abundantly hardy. I have never seen the genuine variety at the Lake Shore, although the name frequently appears in the lists of cultivators. The fruit, when produced, ranks with the very best of its class.

REEVES'S LATE YELLOW.—The tree of this variety, as it comes to us from Eastern sources, is hardy, vigorous, rather upright, with large, strong foliage and reniform glands. It bears abundantly. The fruit is large, roundish, pale yellow and bright red, dappled with dark purplish-red in the sun, with slight, dingy pubescence. Flesh, yellow, red at the pit, rather firm, yet melting in texture, juicy, sprightly, vinous, subacid. It ripened, the past season, at the close of September and the beginning of October. In size and character it is much like Early Crawford, and even more beautiful and desirable, with only the doubt whether it can be ripened perfectly, here, in unfavorable seasons. In spite of such doubt, however, since such seasons are of rare occurrence, I esteem it one of the most promising recent introductions, especially for market purposes.

SILVER MEDAL is another recent introduction from the Atlantic peach district. The tree is a vigorous grower, with broad, strong foliage, and leaves almost serrate. The fruit is of fully medium size, roundish, white, or faintly reddened in the sun, slightly pubescent. The color of the flesh is clear white, free from either red or brown at the pit which is light brown. Its firmness and moderate juiciness qualify it well for market handling; while its flavor is "very good." For canning or drying, when a white flesh is desired, I regard this as one of the best. It is, however, rather late for certainty in this climate, ripening at the end of September and beginning of October.

GUGEON'S LATE is another late, pale-fleshed peach, which comes to us from Ohio, with a local reputation in the vicinity of Cincinnati. The tree is strong, rather spreading in habit, with large crenate foliage and reniform glands. The fruit is large, round, greenish-white and dark red, with a very slight pubescence. Flesh white, slightly red at the pit. Texture fine-grained, tender, juicy; and flavor vinous, sprightly, pleasant; season, quite late—beginning of October.

STEADLEY is another recent introduction from the East, ripening with the above—about the beginning of October. Fruit medium to large, roundish ovate, creamy-white, with spots of red in the sun. Flesh dingy-white to the pit, firm, juicy, mild, rich. Should it prove adapted to our seasons, I regard it as a very desirable variety both for family and market purposes.

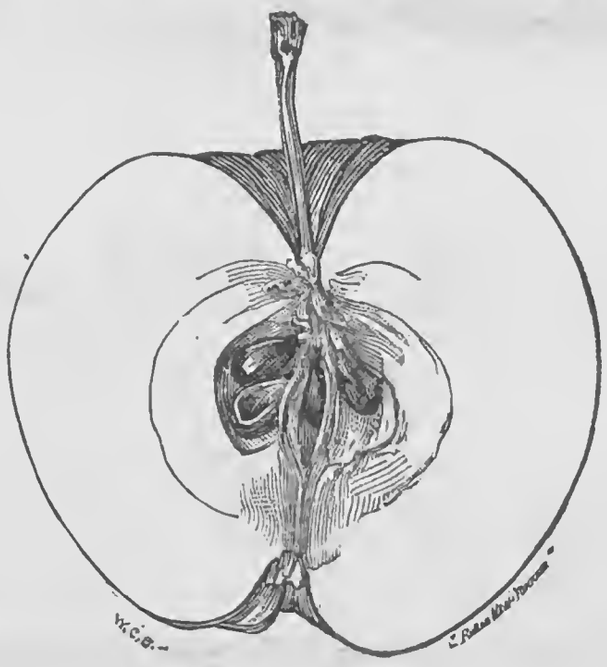
VARIEGATED FREE.—In preparing a notice of this peach some time since, its history had escaped my recollection. It originated with the late Isaac Pullen, of Hightstown, New Jersey. A figure and description by the editor (Peter B. Mead) will be found in the Horticulturist for September, 1863, from specimens received from Mr. Pullen.

SEEDLING JOE APPLE.

PETER B. MEAD.

SIZE, small, sometimes nearly medium. Form, oblate, with unequal sides. Color, red, striped and splashed with darker and lighter shades, with occasionally a little green and russet. Calyx, closed in a moderately deep, medium-sized basin. Stem, long and slender, inserted in a deep and rather open cavity. Flesh, white, slightly tinged with yellow, very tender, moderately juicy, with a sprightly and somewhat spicy flavor. Quality, very good. Season, early July to beginning of September.

The accompanying illustration is an excellent portrait of an average-sized specimen. The apple is a native of Westchester Co., N. Y., and is a seedling of the Early Joe. In fruit it also partakes somewhat of the character of the Summer Rose. The tree is a good grower and very productive, bearing in alternate years. In addition to its earliness, it is one of those tender-fleshed, digestible apples that commend themselves to those who regard the apple as an article of food rather than something to please the palate, and in its season we have none too many such.



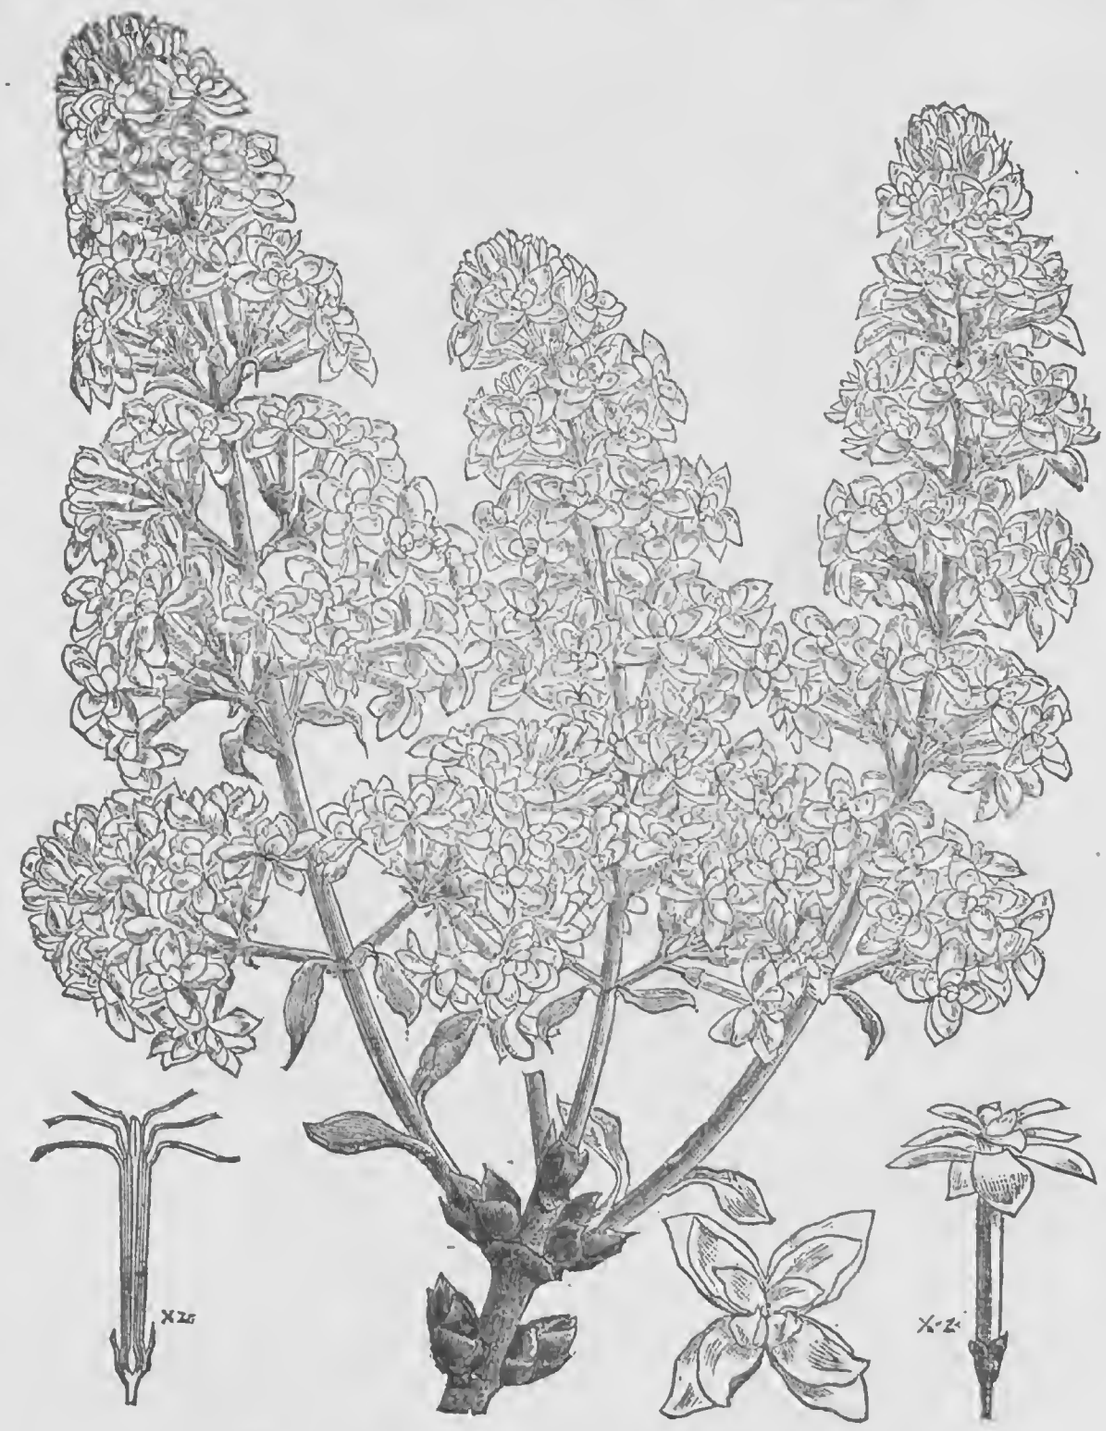
SEEDLING EARLY JOE—FROM LIFE.—FIG. 219.

EARLY JOE.—This apple succeeds best in Kentucky and Louisiana of the South, and fairly well in Georgia, Utah, Kansas, Iowa, Missouri, Illinois, Penn., New Jersey, Ohio, Indiana, Michigan, Ontario, New York, Mass. and Vermont. In quality it is rated "best." It ripens in late Summer.

Floricultural.

A New Double Lilac.

WE are glad to see anything that is likely once more to bring the beautiful but neglected lilac into notice. Some time ago we spoke of the double lilac, of which we are now enabled to place before our readers a cut re-engraved from the London Gardeners' Chronicle. It is called Lemoine's New Double Lilac. It is now in the hands of William Bull, the famous London seedsman—and will, no doubt, reach this country the present season. The flowers are said to be very double, as shown. There is at present a double lilac offered by some of our nurserymen—the flowers of which bear a double row of petals. It is said to be "neat and pretty and valuable for cut flowers."



LEMOINE'S DOUBLE LILAC—Fig. 220.

STARTING SLIPS.

As I have been very successful in growing plants from slips, I will send my method:—

I take common prairie loam and heat it in the oven to kill all larvæ; then, while this soil is cooling, I cut my pan of slips, using a thin, sharp knife, and taking great care not to crush, squeeze or mar the stems of the slips or cuttings. I use shallow boxes, as extent of surface and ease in moving are of much importance. A raisin-box will do, or even a cigar or fig-box; I have used them all with equal success.

Then, with my box of earth standing on the table, I empty my pan of slips beside the box. I have a four-bladed pen-knife, which is my only divider, pruner and trowel. With the largest blade, which is quite sharp, I cut the slips about two and a-half inches long for salvias, coleus and heliotropes, trim off all of the lower large leaves, letting only one full-grown leaf and the small ones remain. In cutting off the leaves, be very careful not to clip or shave the stem. Cut the leaf-stalk, or petiole, only. In dividing the main stem into slips I usually cut at or near a bud or axil, so that the base of each slip shall be a bud or joint, where young rootlets are observed to start soonest.

Having cut and trimmed eight or ten slips—enough for one row across the box—then with my knife I make an opening in the soil by inserting the blade straight down its full length; then, having pressed the earth towards me slightly with the side of the blade, a space is opened wherein I slowly slip down the cutting, remove the blade, and gently press the earth back against the inserted slip. In this manner the whole box is quickly filled. A medium-sized raisin-box will give space enough for 100 or more slips. I filled one last Fall with 108 slips, and all are now growing except three.

When the box is filled with slips it is then sprinkled with lukewarm water; this sprinkling of the leaves several times each day is continued till they begin to turn or grow towards the light, when I find by observation that all sun-seeking leaves have roots formed or started. I used to pull up my slips to see if the roots were formed, but now I watch the leaves; if they turn towards the light I am satisfied that roots are there without seeing them. Slips need plenty of fresh air, and if the

leaves are kept sprinkled they can stand in the strong sunlight; still it is better to give a mild light for the first day or two. Whenever a warm, gentle rain is falling, I always carry out my boxes of slips and set them in a safe place to enjoy the rain, and they reward my trouble by living and growing vigorously.

Momence, Ill. L. A. R.

CORCHORUS.

It is impossible in a great crowd to pay a formal tribute to every friend one sees. So in the immensity of horticultural collections some valued plants can only gain notice here and there and now and then. I have in a corner a pair of Prairie Roses, and growing up with them is a plant with similar but more slender, long, green twigs resembling compound leaves, and rose-like flowers that are bright yellow. But for these floral buttons of gold the plant might almost be taken in the Summer as a curious offshoot of the roses. It is, in fact, a near relation, being of the same great botanical family—the Rosaceæ—and of the same branch of it with spiræas, potentillas, strawberries, raspberries, etc. Three or four spiræas, too—red and white—are growing as a fronting to the group, hiding the bare stems of their taller relatives the little Callosa alba and Filipendula feathering down to the surface. When I planted the green-twigged companion of the roses it was called Corchorus, but it seems that it should be called Kerria. It comes from Japan, and I have since had the pleasure of an introduction to, and possession of, a dwarf variety of it with leaves of elegant figure, marked prettily with shaded green and clear white. This has the merits of equal hardiness with the type and of preserving its pleasing variegation bright and pure through all weathers to the end of Summer. I am told there is also a golden variegation of the Kerria, but I have not seen it. [It does not hold its variegation very well.—Eds.] I mean to put in slips of this pretty thing for fronting some beds of evergreens. It disposes itself naturally in a round, bunchy tuft. I think it will be better used as a "row of buttons" round a bed of shrubs than the Euonymus radicans, which resembles it, but is stiffer in its attitudes. I have used the Golden veined Honeysuckle as a continuous mass of low foliage in front of a bed of evergreens, with very good effect, and now I want to try silver. The Kerria is the more interesting when one knows that the jute fiber, which has become of late such a great item in the world's industries and commerce, comes from a species of Corchorus which also has long green stalks, reaching unbranched to an altitude of 10 to 15 feet, thus yielding a very long and even, as well as tenacious fiber, the cheapest that is known. This is grown in tropical countries, and chiefly in Bengal. Besides its use for the strong, coarse gunny cloth, the finer parts are used for shirtings, etc., and to mix with flax, wool, cotton, and even silk. W.

Horticultural.

RURALISMS.

In a recent number of the Rural there is an allusion to the supposed identity, by some, of the Burbank and St. Patrick Potatoes. I have seen it stated elsewhere in the most positive manner, that they are identical. How this identity is arrived at and established I do not understand. I had the potatoes from the original sources, and I never saw anything about them to arouse the least suspicion that they were identical. I think an examination of the skin, eye, flesh, and average size of each will lead to a different conclusion, to say nothing of the manner of growth. So, too, it is asserted quite as positively (and at this early date too) that the St. Patrick and the White Elephant are identical. [The difference in the time of ripening alone would settle such a question.—Eds.] And yet they do not grow alike, do not set their tubers alike, and their eyes are not alike, or my eyes are all wrong. I had my White Elephant also from original sources, and I cannot see where the identity comes in. All three of these potatoes resemble some other kinds much more than they do each other. It must be that the parties who see these identities have not the true kinds. But is it not pretty nearly time to begin to reduce the list of potatoes? What is the use of so many when they only serve to bother investigating minds?

H. T. J., in the Rural for April 9, expresses his regret that so little has been said about the Cut-leaved Weeping Birch. I hope it will be some sort of pleasure to him to learn that I agree with him in all he says in regard to its beauty. I cannot at this moment remember a tree that has greater claims for a conspicuous place on the lawn. I not only give it such a place on the lawn, but sometimes when the case will admit of it, put one on each side of the entrance gate, where they grow into exceedingly graceful trees, and make a pleasing first impression on entering the grounds. They serve another and a useful purpose when thus located: there will scarcely ever be a night so dark that their silvery-white trunks will not distinctly point out the place of entrance. They are lovely guide boards of Nature's own making. I, for one, am grateful to the Messrs. Ellwanger & Barry for having introduced and made known this very beautiful tree.

Years ago I pursued almost precisely the same plan as Gen. Noble in improving the sweet corn, and with similar results. At the end of six years I could rely upon three and four ears to a stalk, and I still have a handsome piece of silver to show for it. When this improved corn was distributed, however, no care was taken in the selection of the seed by those into whose hands it fell, and, in consequence, it gradually deteriorated. Let it be understood that such corn as I saw at the Rural Farm last Summer cannot be long grown without careful selection of seed and good cultivation. Improvements in corn made by selection can only be maintained by selection; and the same remark will apply to some other things as well as to corn. Gen. Noble's article is timely and to the point. If this matter of selection were carefully and generally observed there would be more frequent occasion to praise and less to condemn.

I like Mr. Wysor's criticism on the word "hillside," and all that it implies and involves. It is well taken, and excellent in manner, and I like it not only for this reason, but because it shows that farmers are not only becoming more careful cultivators of the soil, but also more careful cultivators, so to speak, of the terms used to express what they do and what they see.

If the Editor will put his tomato stakes in the ground just as he does, and then, instead of laths or sticks, use tarred twine in their place as the plants progress in growth, he will have a neater arrangement and save some time and labor. The tarred twine can be put around the stakes as soon as set, making a single hitch at each one, or it can be cut of a proper length, rolled into a ball, and put around as the plants increase in growth, and they will need but little other tying. Forgetting the hammer nine times out of ten led me to the tarred twine or marlin. The plan, whether laths or tarred twine be used, is, as the Editor says, an excellent one. Like him, I have never used an upright trellis that suited me.

It may not be improper for me to say, in reference to growing the Thunbergia on the ground, that I first received the suggestion from Mr. Charles Downing. I make the statement because I do not wish to take to myself credit which does not belong to me. I only varied the practice by confining the plants to a bed; but they may be grown on the ground elsewhere just as well. Horticola.

STRAWBERRIES AND THEIR NAMES.

"What's in a name? That which we call a rose by any other name would smell as sweet." The *newest* thing to me among strawberries is the nomenclature—and some of the names *are* fresh, very fresh—Imagine a scene like this:

(Young lady customer admiring some very fine berries.) "Beautiful! What is the variety?"

(Boy clerk.) "Them is Shirts."

(Young lady.) "How?"

(Boy clerk.) "Shirts."

(Young lady.) "Oh! Carl Schurz."

(Boy clerk desperate, but bound to be accurate.) No. ma'am, "S-h-i-r-t-s."

(Young lady.) "Oh—ah!"

(Young lady's face, boy-clerk's face, and innocent little box of Shirts all of one color.)

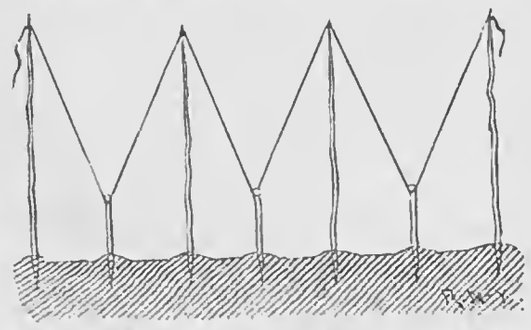
This reminds me of an incident of last Summer, that is encouraging to those who are growing fruit for market and take a pleasure in supplying the finest berries. Meeting a city friend whose taste had been previously "educated" by an afternoon spent at our place feasting on some of the choicest kinds, he wanted to know why growers didn't label the varieties they marketed to the storekeepers. He was sick of eating sour berries, and had discovered that there was a difference in strawberries; if berries were only labeled he would know which to buy. I had just stored away in my pocket the proceeds of a few crates of Monarchs and Jucundas, for which the magnificent sum of seven cents a box had been received, and was a little taken aback, but getting my hand into my pocket and grasping my wallet for reassurance, I replied that I was contemplating, if the price didn't fall off more than six or seven cents a box, throwing in a chromo lithograph with every box next season.

But, in truth, is it not an encouraging sign when customers begin to discriminate? Poor, pitiable city folks! What poor stuff they eat in the way of fresh fruits and vegetables! Many a man carries home from the market wilted, mashed and dried up berries (quite likely as good as can be bought there), who has unoccupied land enough at home to supply his table daily with berries as much better than those he can buy as cream is better than skimmed-milk! So they live, pitiable people! smacking their lips over poor, wilted berries, hardly ever tasting a berry in its delicious freshness; but if they wont read the Rural, what can we do for them!

A friend who retails many of my berries had often told me that his customers still liked the Wilson better than some of our choicest varieties; they bought the large and handsome ones because of their attractiveness, but after all preferred the flavor of the Wilson. At first I thought it a clear case of "depraved" taste; but I find the people are quite correct in their opinions. The truth is, nearly all of our finest berries rapidly deteriorate in flavor after picking, while the Wilson improves. Picked an hour or two before eating, nine out of ten people would prefer any of the choicer varieties to the Wilson; but if the berries be kept until morning, the Wilson will be preferred by the majority. Now, what is wanted for a market berry is one of large size, good color and form, as productive as the Wilson, but of better flavor. Customers are beginning to discriminate and will appreciate fine flavor. We have berries early enough and late enough and large enough; for home use we have plenty of handsome, superb delicious berries; but now we want for market one that will be of *good flavor when picked and just as good twenty hours afterwards.* When the "coming" berry comes, Mr. Editor, be at the christening and don't maim it with a name.

Rochester, N. Y. "Bannockburn."

Stringing Pole Beans.—I would like to tell the Rural readers my way of stringing pole beans. I planted the beans four feet apart each way, set a pole and stake at each alternate hill, and ran some strong cord from the end of the stakes to the top of the poles.



Method of stringing pole beans.—Fig 221.

By this means only half the amount of poles are required, and the effect is very fine if the beans are planted at the back end of a garden. Last season I planted white and scarlet runners—commonly called Dutch runners—and they were the admiration of all who saw them. A. W.

Field Crops.

TOBACCO CULTURE.—NO. 8.

G. A. GOFF, JR.

The Curing of Tobacco.

That the proper method of curing seed-leaf tobacco, and the correct mode of managing sheds in regard to ventilation while tobacco is being cured, are not generally known is shown by the conflicting opinions that exist on the subject among tobacco growers themselves. It is not unusual to find tobacco growers of wide experience who virtually disagree with regard to the manner in which the tobacco barn should be managed during the process of curing the tobacco. It is an important subject and one which deserves the closest attention from tobacco growers, for in a great measure the quality of the cured leaf depends on the manner in which it is cured. Color is an important element in the quality of tobacco, and it is only by proper curing that good colors can be obtained. The inexorable law of fashion at the present time demands rich, dark-colored wrappers for covering fine cigars; hence the importance of knowing how to obtain them.

As the natural laws which govern the curing of tobacco are not as yet generally understood, I cannot give *facts* in this part of my paper. The best I can do is to state my *beliefs* along with those of our most experienced and successful growers. It is a well known fact that tobacco in a given section in certain seasons cures with an exceptionally good color, varying only with the various conditions and qualities of soils, and, somewhat, with the kind of barn in which the crop is cured. At other seasons in the same section the color of the tobacco will be generally poor. The cause of such variations has not as yet been satisfactorily explained. It is the general belief that rapid drying tends to produce light colors, and the reverse, dark colors; but the difficulty lies in so governing the process that the curing shall be slow and gradual and yet escape the dreaded "pole-burn." After tobacco has been hung a few days in the curing barn it begins to sweat, or show considerable moisture on the surface of the leaves or stems. This, I believe, is a critical period and the time when pole-burning is most likely to occur. If this moisture dries off well there is less after-danger, yet it should not dry too rapidly for the best results.

In order to test the relative difference between rapid and slow curing, I selected two tobacco plants of equal size and in equal stages of development and hung them up at the same time, one in a dry, airy loft, where the drying was very rapid; the other in a damp cellar, where the curing must necessarily proceed very slowly. The result of the experiment proved a decided gain in favor of gradual curing—at least as far as color is concerned. The color of the leaf hung in the dry loft was very light, and, on the whole, very undesirable, while that in the cellar was a rich dark brown.

Undoubtedly much depends on the weather in the curing of tobacco. It is a well-known fact that in certain seasons tobacco in a given locality cures with too light colors. At other seasons a general complaint is heard among growers that their tobacco is pole-burnt. These variations of quality are probably owing to the general character of the weather during the curing process, or they may occur from the character of the growth of the plant. If the weather produces the colors, we might prevent danger either from too slow or too rapid curing by some artificial means. The loss in this section during some seasons from pole-burning unquestionably amounts to many thousands of dollars. This loss I believe might be avoided if our growers knew just how and when to produce artificial ventilation in their curing barns. We need to know at just what stage of the thermometer and barometer the burning begins and how to secure ventilation to avoid it.

Notwithstanding the fact that the subject of tobacco curing is not thoroughly understood, much can be done to regulate the process, tending towards the desired object. As a preventive of pole-burning the tobacco should not be hung thick. From 20 to 25 pairs of plants should be hung upon a 14 foot pole, the number varying somewhat with the size of plants and the distance they are hung from the ground, as the higher up they are hung in the barn the more rapid is the drying.

The method of managing the ventilating doors followed by our best growers is to keep them tightly closed in dry or windy weather and to open them freely when the air is moist or the weather is what is termed "muggy." It is during this muggy weather, when little air is stirring, that the pole-burning is most likely to commence, hence at such times it is advisable to admit as much air as possible, and to close the barn correspondingly tight during dry, windy weather.

MANGOLDS. EXPERIMENTS.—1880.

PROFESSOR I. P. ROBERTS.

Notwithstanding the marked success of some in the preservation of green fodder in silos for Winter feeding, there will still be a great want felt by the small farmer at least, for some succulent cattle food to give tone and health to his animals during the long, hard Winters. All things considered, nothing so perfectly meets that want in most parts of the United States as the mangold. The grasshopper damaged the experiment crop of 1879 and therefore I do not consider the results as reliable as they would otherwise have been. If they taught anything it was that Norbiton's Giant is a more productive variety than the Yellow Globe and that but a slight increase is produced by the liberal application of commercial fertilizers.

Fertilizers.

No.	Variety of seed.	Fertilizers per acre.	Yield per acre. Tons.	lbs.
1	Norbiton's Giant.	481 lbs. Pacific Guano Phos.	14	160
2	" "	No fertilizer	14	480
3	" "	480 lbs. Swift-Sure Phos.	12	1280
4	" "	No fertilizer	14	1680
5	" "	480 lbs. Sulphate of Ammonia	12	1120
6	" "	240 lbs. Sul. Am. 240 lbs. P. G. Phos	16	320
7	" "	No fertilizer	15	1200
8	" "	480 lbs. Plaster (Gypsum)	14	480
9	" "	Results of duplicate plots. 480 lbs salt.	18	860
10	" "	Results of duplicate plots. No fertilizer	15	160
11	" "	12 cords Farmyard Manure	20	800

The following are the results of *duplicate* plots. They were *all* treated to fairly rotted farm-yard manures at the rate of 12 cords per acre.

No.	Variety of Seed.	Yield per acre. Tons.	lbs.
12	Imperial Large Red	23	340
13	Carter's Warden Prize Yellow Globe	29	880
14	Yellow Globe	24	100
15	Norbiton's Giant	25	280
		Tons.	lbs.
The largest yield of any single plot in the experiments with varieties was produced by Carter's and gave		33	1520
The smallest yield was Yellow Globe		23	720
	Averages.		
Average yield of the four phosphated plots		13	970
" " of the four adjoining unfertilized ones		15	75
" " of nine plots treated to farm-yard manures		24	1777
One plot rotted		18	860

It will be noticed that the yield of Norbiton's Giant this year, as well as last, is larger than that of the Yellow Globe. The greatest yield of any single plot (Carter's) was 15,360 pounds per acre greater than that from the Norbiton's Giant plot, which was the next highest. Superphosphates, instead of increasing the yield, appeared to diminish it, not through any inferiority of the superphosphates, but owing, as I judge, to the excess of lime in the soil, which causes them to pass quite back into their original insoluble condition.

My experiments already point to the fact that superphosphates do far more good the second year than the first on *our land* and on all lands that have an excess of lime. This points towards the economy of using phosphoric acid in a form not too soluble. This explains, I think, why no increase of yield is produced by the application of these fertilizers. The actual diminution is caused, without doubt, by the phosphate taking up the moisture that the seeds require to cause them to germinate. There has been entirely too indiscriminate use of superphosphates, and if the scores of experiments with them conducted at the University, in which not one in a score has given any marked increase, are studied carefully, I trust it will induce more farmers "to prove all things," and in spite of flaming hand-bills and persistent agents, "hold on only to that which is good." I believe the superphosphates applied to lands rich in lime are far from being lost, and it is merely a matter of dollars and cents whether these expensive fertilizers can be applied profitably when the returns come in so slowly.

It should be taken into account, in arriving at conclusions, that the superphosphates in the above experiments cost but about one-third as much per acre as the farm manures. The farm-yard manures cost very nearly $2 per cord. This is expending $1 per ton for fertilizers alone, and adds quite largely to the cost of the roots, but it must be remembered that this land is now in a condition to produce, in an average season, 35 bushels of wheat or 80 bushels of corn per acre. My former experiments lead me to expect that the superphosphated plots will fall considerably below this, but will show an increase over the unfertilized plots.

The salt appears to have had a marked effect, raising the normal yield of 30,160 pounds to 36,860 pounds. The continuous use of the amount named above on clayey land for three years caused it to become very hard and lumpy and quite unproductive. After experimenting with salt for seven years my judgment is that it is usually beneficial to almost any crop in a dry season, and may be used liberally on sandy, gravelly, dry soils, but should not be applied continuously, or in large quantities, on heavy or wet lands.

SATIN GRASS.
(Muhlenbergia glomorata)

This grass has no common name except those given in certain limited localities, and such names are of little value. One such name is "Wild Timothy," another "Satin Grass." It is a rather striking grass, quite easily recognized and to most people it looks as though it were valuable. I have often been asked to name it, and I am glad to see a good cut of it. It is indigenous to bogs, marshes and dry, sandy barrens, especially northward. Its presence is no indication of improvement in a marsh and no indication that our common grasses will grow in the same place. The grass is sparingly branched; the stem quite hard and woody, especially near the base. The panicle is contracted into an interrupted lead-colored spike about three inches long. Experiments testing its feeding qualities are not yet to be found in any of our books. I have never seen it growing anywhere in great quantity, the plants usually appearing scattered here and there among sedges and other grasses. PROFESSOR W. J. BEAL.

A Small Patch of Beets.

As a garden crop I find this quite profitable. I have always sown them quite thick, as the thinnings were in good demand for greens, but last season they were entirely worthless for this purpose, as there were worms in the leaves. They were hard to discover until the greens were cooked when small white maggots appeared so plentifully as to entirely destroy our appetites for beet greens. As soon as I found the beets were worthless for greens, I thinned out the bed, leaving the beets about three inches apart, I planted Egyptian Beets and Bastian Half-long Beets which I recommend very highly, the first for earliness and the second for quality. When the beets were about half-grown I pulled them and tied them up in bunches and sold them at a good, round profit. I then set the ground to cabbages, and they were a good crop. This Summer I intend to sow some of the early varieties late—about the 1st of July—to see if I can get a good quality of Winter beets. ADELBERT WAKEFIELD.

Sheep Husbandry.

MORE ABOUT WINTERING SHEEP.

J. S. WOODWARD.

The many questions of Mr. Wilson, of Fayette Co., Pa., which the RURAL refers to me, can best be answered by a short article which shall cover the various points.

BARNS.—Our barn is 76 by 82 feet, having an above-ground basement under the whole; this is divided into 16 pens or four rows of four pens in each row divided by two alleys In addition there is a lean-to 26 by 76 feet with a basement also, and the floor above is also used as a feeding floor. These are both divided into pens, giving sixteen more pens 11 by 18 feet, which are used for feeding and shearling lambs.

WATER.—The whole is supplied with a system of water pipes running overhead in the basement part and under the floor in the feeding-room above, and these pipes are supplied from a large tank elevated 20 feet and filled by means of a wind engine and pump. Water is drawn into a trough in each pen, which is four feet long, four inches deep and eight inches wide, and kept constantly full, as each cock is allowed to drip just enough for that purpose.

GRAINING.—The sheep are put into these pens just as soon as frost deadens the pastures and before cold weather, and are kept there constantly until they are ready for market. We commence to grain as soon as they are put into the pens, beginning with a very light ration and gradually increasing it until we feed all they will eat with a good relish. Nothing about us is ever allowed to go hungry to "lean a streak of fat." We mix bran, oil meal and corn together but have no fixed formula. Sometimes oil-meal is cheaper than bran and then we feed more oil-meal; and so if bran is cheaper we feed more bran. We find we can do very well feeding corn and oil-meal with a little bran, or corn and bran with a little oil-meal. The great fattener is corn, and the bran or oil-meal furnishes the albuminoids. Still we prefer all three in the mixture. At present we are mixing three bags of corn, two of oil-meal, and two of bran, having bought at last Fall's prices.

SPIKELET OF SATIN GRASS.—FIG. 223.

RACKS.—We use several styles of racks, and for some purposes we like one best and for another, another; but for general purposes we like a rack that is so made that hay or straw, roots and grain are all fed from the same place. For breeding ewes and lambs a rack having a slatted V-shaped place above for forage and at the bottom on each side a V-shaped trough for grain and roots, suits us best.

ROOTS.—We have no more trouble to teach the sheep to eat roots, than we have in the horse to teach children to eat sugar. There is no teaching about it—they take to them naturally. The lambs, if they can get at a mangel, will scoop it out and eat it long before they will eat hay. We feed mangels twice each day; they are cut with a root-cutter that scoops them out with a circular knife which breaks them all up into little pieces about as large as a walnut. A pen of 20 sheep to do well should have two bushels of mangels each day.

SATIN GRASS—MUHLENBERGIA GLOMERATA.—FIG. 222.

KIND OF SHEEP.—Of all the sheep we have ever fed, we like Merino grades best—they are quieter and will bear close yarding, and do much less fighting than other sorts. If we feed wethers we like them to be from three to five years old and to weigh, when put in, as near 100 pounds as we can get them. This class we do not feed all Winter, but we hurry them along to sell them in February or March to make room for our lambs, and we usually get them by this time to weigh from 125 to 130 pounds. Coarse-wooled sheep will not bear being put in such large flocks either in the barn or in the pasture after we have bought them and before penning time.

We feed a good many shearlings, that is, lambs coming one year old. Like grades produced by using a Cotswold or South Down buck with a Merino ewe, we can make these run over 100 pounds by March 15th, and find rearing them to pay us much better than wether feeding.

COST OF FEEDING.—It will cost to keep a wether on full feed, for grain, hay and roots, counting roots at four cents per bushel (which is more than mine cost), 50 cents per month, saying nothing about the attendance which is much more than offset by the manure. So, if we keep a wether four months, the advance must be $2. to get out even, or for five months, $2.50. We should be satisfied if we got our money back paying for everything that is fed, because we get such a large quantity of very excellent manure; but we have always done better, even in the worst years making a fair profit. But we find the rearing of Winter lambs much the most profitable. We often make the gain of ewes pay the entire cost of keeping and get the lambs, which sell for from four to six dollars each, as clear profit, and when we can do that it is a very money-and-manure-making business. But let me say right here, as little as some *learned* professors think of mangels, any man who attempts to raise early lambs for market without an abundant supply is a *fool*, however learned he may be.

LAMENESS.—It is possible to feed sheep so irregularly and carelessly as to founder them the same as a horse is foundered; but the most cases of lameness are caused by the pens not being well littered or by not keeping close watch over the sheep. If you see a sheep showing lameness, catch it at once and examine its feet and clean between the toes, and if there is any symptom of rot, separate the animal at once from the flock and treat it for foot-rot.

GENERAL REMARKS.—Feeding sheep requires more care than any other branch of stock-growing. To succeed you must have system and regularity and be punctual in all operations. The sheep know as well as a clock will tell when feeding time has come, and they want their feed just then, and if you wish to be successful you must be on time They should also be kept very quiet. Never allow a dog in sight of the pen, and don't show strangers around any more than courtesy requires. The great secrets of success are, variety of foods, plenty of roots, prompt care, warmth of barns, good ventilation, plenty of fresh water, cleanliness of rack and trough, quietness, and, above all, a *gentle, loving shepherd.*

Close Confinement of Sheep.

Having formerly had considerable experience in wintering sheep, I desire to express my concurrence, generally, in the ideas expressed by J. S. Woodward in the RURAL of Feb. 5, in relation to the above subject, and to state a fact in my own experience:—Somewhere about the year 1845, I had on hand some 250 fine-wooled sheep, which I purposed to attempt to winter. Some of them were rather old, and others feeble from other causes. I put up a temporary shed of posts and loose boards in the corner of the yard, and inclosed a small space in front of it for their feeding ground in fine weather. I selected 20 of the most feeble ones from the main flock, such as I judged were not strong enough to compete successfully with the stronger ones, and put them in that yard at the commencement of Winter, and did not allow them to go out of it once during the season, which was a very severe one. I was particular to furnish them with good hay, and a fair feed of roots, each day. The result was they actually gained in flesh finely all Winter, and all came out in the Spring vigorous and in fine condition. Had I allowed them to run at large with the main flock, no doubt I should have lost a majority of them. As it was, I did not lose one.

Oneida Co., N. Y. "CLINTON."

The Herdsman.

NOTES BY A STOCKMAN.

The fighting Irishmen at the noted Donnybrook Fair go on the principle of "whenever you see a head hit it; never mind if it is your own father's; he must look out for his own." I like to act on this principle. I want to tell the truth and let consequences regulate themselves as they may. I know the RURAL desires the truth should always be told. We must all stand on that foundation or we must fall.

THEREFORE I have to say that when the RURAL (March 19, page 193), in its column of Brevities says, "Cows' milk causes worms" in puppies, it inadvertently (and I know uniu-

tentionally) helps to give credence to a popular delusion. A great many farmers believe that worms are *caused* by improper feeding. The truth is that these parasites are *encouraged* in that way, but they proceed from eggs, as all other live creatures do, directly or indirectly, and these eggs gain admission to the animal's stomach in a natural way, and by no means spontaneously originate there.

THE internal parasites of animals are wonderfully numerous and varied. From the microscopically minute organisms known as *bacteria*, of which millions may be engendered in one ounce of liquid, to the huge tape-worms many feet in length, animals suffer almost universally, more or less. It may be safe to say that the lower animals are rarely free from internal pests of some kind, the eggs of which are picked up with the food or swallowed with the water. When the animal is in vigorous health and all its functions are in good order and the wastes of the system are discharged regularly, the parasites find no means of subsistence and are either starved out or merely maintain a sort of paralyzed existence. But when from any cause these functions are deranged, the parasites find their proper food in the abnormal matter then abundant in the system and thrive and increase enormously. It would simplify this matter very much if we could always realize that parasites of all kinds—animal and vegetable—are introduced from outside sources and never come from within. Then we should also realize the fact that they may be prevented by avoiding the sources from which they are introduced, and by maintaining the health of our stock.

YOUR correspondent "Buckeye," page 194, hits the nail squarely on the head, when he asks "is not salt a preventive of this calf-killer black-leg?" It is; and thus:—Black-leg is a parasitic disease. The blood is invaded by organic germs which deoxygenate it and leave it filled with carbon and black, just as it is found when the lungs cannot or do not exercise their functions and remove the carbonaceous matter from the system. These germs produce in the blood plants of a very low order, which increase with amazing rapidity and soon cause the blood to become unfit to support life. The germs exist everywhere, just as the germs of mold are universally prevalent. When an animal becomes diseased by indigestion, overfeeding, or starving, the blood becomes in the right condition for supporting these parasitic germs and they at once germinate and increase in it until it is fatally poisoned. Now, salt is a great help to digestion; it supplies the blood and all the secretions derived from it with an indispensable constituent. Further, it is an antiseptic and acts not only as a nutriment but as a medicine. So that "Buckeye" is right; but at the same time any other means of securing the healthful assimilation of food and the perfect excretion of waste matter from the kidneys and bowels, will act as preventives. Yet salt is indispensable.

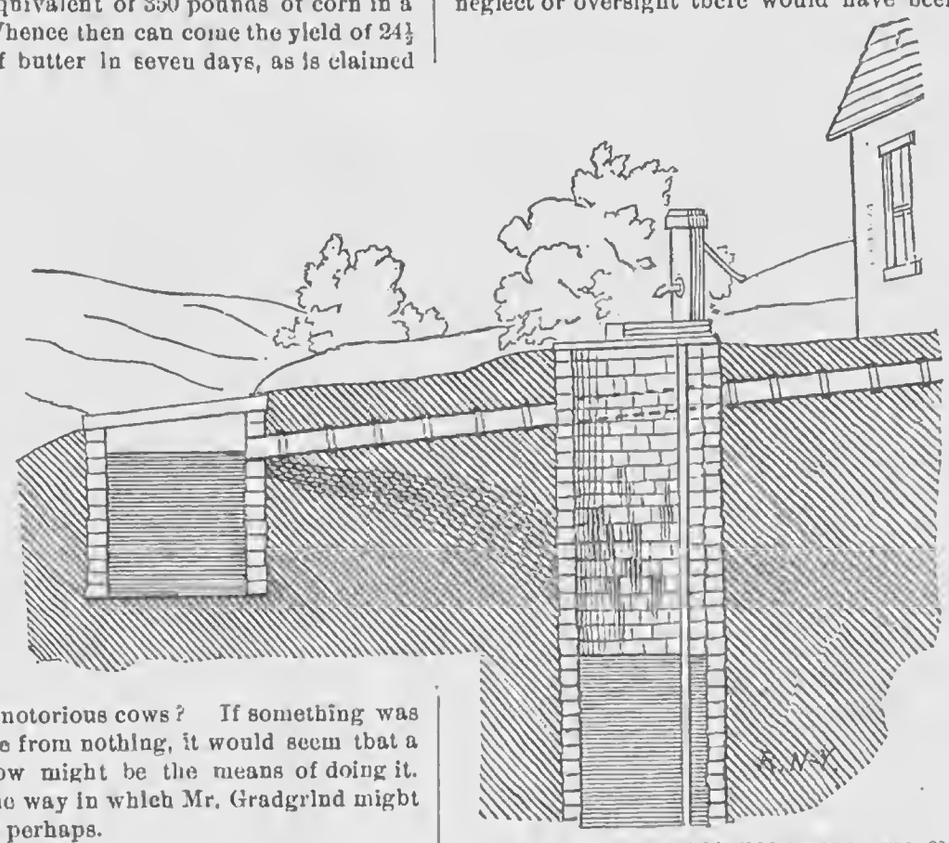
WE cannot believe too strongly, that perfect sanitary measures, both as regards feeding and cleanliness, are as necessary for the welfare of our domestic animals as they are for our own safety.

I AM glad to have the support of so trustworthy an authority as Mr. R. Goodman Jr. in my appreciation of our American Jersey, as also in my opinion of the value of judicious in-breeding for the building up of improvements in our live stock. In a recent contribution to a New England contemporary, he sums up his belief as follows: "The best Jersey cows living are in America. The best American Jerseys have the longest lines of American breeding behind them. We may expect to go on improving. It is to the prepotency gained by in-breeding that this improvement is due. A dash of entirely fresh blood is valuable." Mr. Goodman is undoubtedly right: but then unless this dash of new blood is of the right kind and is able to coalesce perfectly, harm may be done. And just here is the point where breeders too often hug the shore "and fear to launch away."

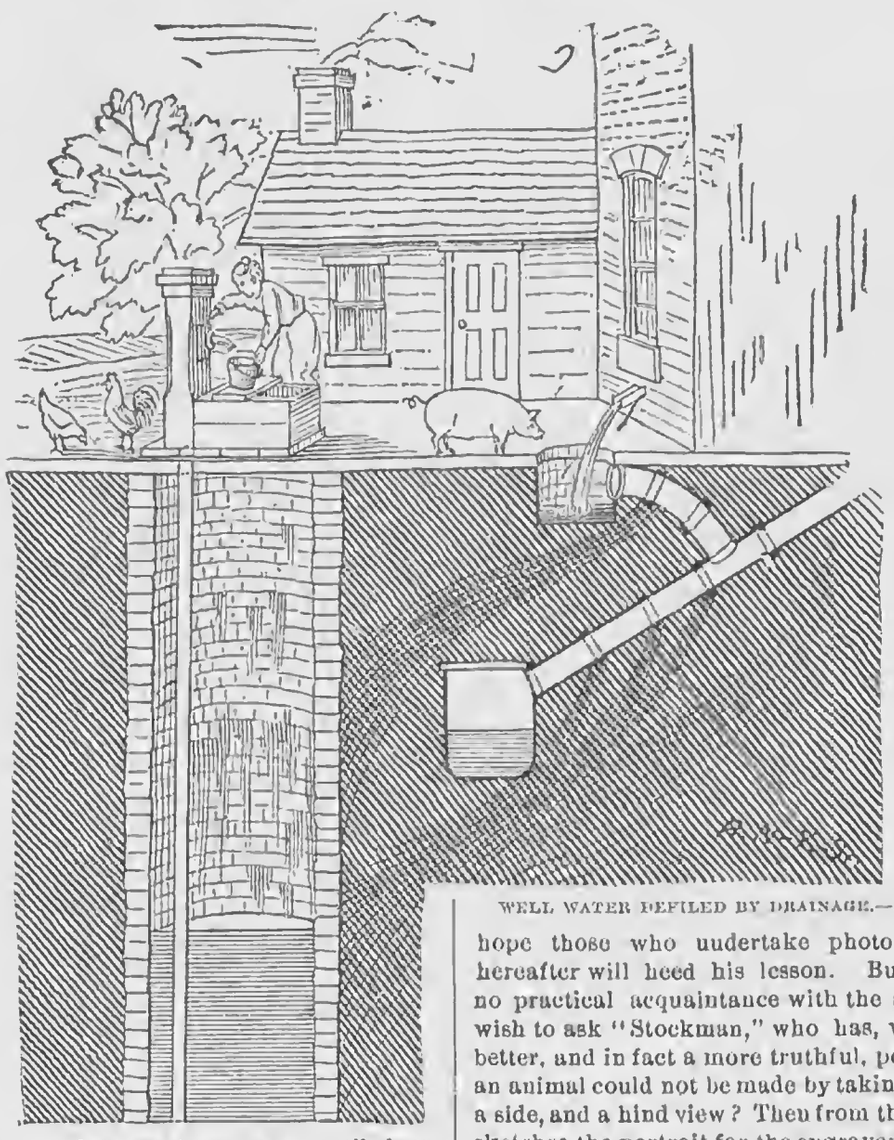
WHY will breeders continue to use words without meaning? What is the difference between a "thoroughbred" and a "full-blood"? As far as regards the meanings of the words, the two terms should mean the same. But "full-blood" is generally considered as really high-grade; six crosses at least of a thoroughbred. Many persons are misled by this use of the word "full-blood." If a Merino sheep or a Short-horn cow is admitted to entry in the Herd Books after six crosses of a thoroughbred, why is it not called a thoroughbred; and if not, after how many crosses does it become a thoroughbred and fit for use for breeding? This is a point that should be settled some time and when it is settled the misleading term "full-blood" will be no longer required.

A HUNDRED pounds of corn contain seven pounds of fat; and 1,200 pounds of hay, 24 pounds of fat. Now if a cow should turn a the fat of 350 pounds of corn or 1,200 pounds of hay into butter in a week, she might produce 24 pounds of butter in that time. If the starch of the food were used up to maintain the animal heat, and the nitrogen, in the waste of tissue and the production of milk, the fat *might* be turned into butter. But no cow ever eat the equivalent of 350 pounds of corn in a week. Whence then can come the yield of 24½ pounds of butter in seven days, as is claimed for some notorious cows? If something was ever made from nothing, it would seem that a Jersey cow might be the means of doing it. This is the way in which Mr. Gradgrind might look at it perhaps.

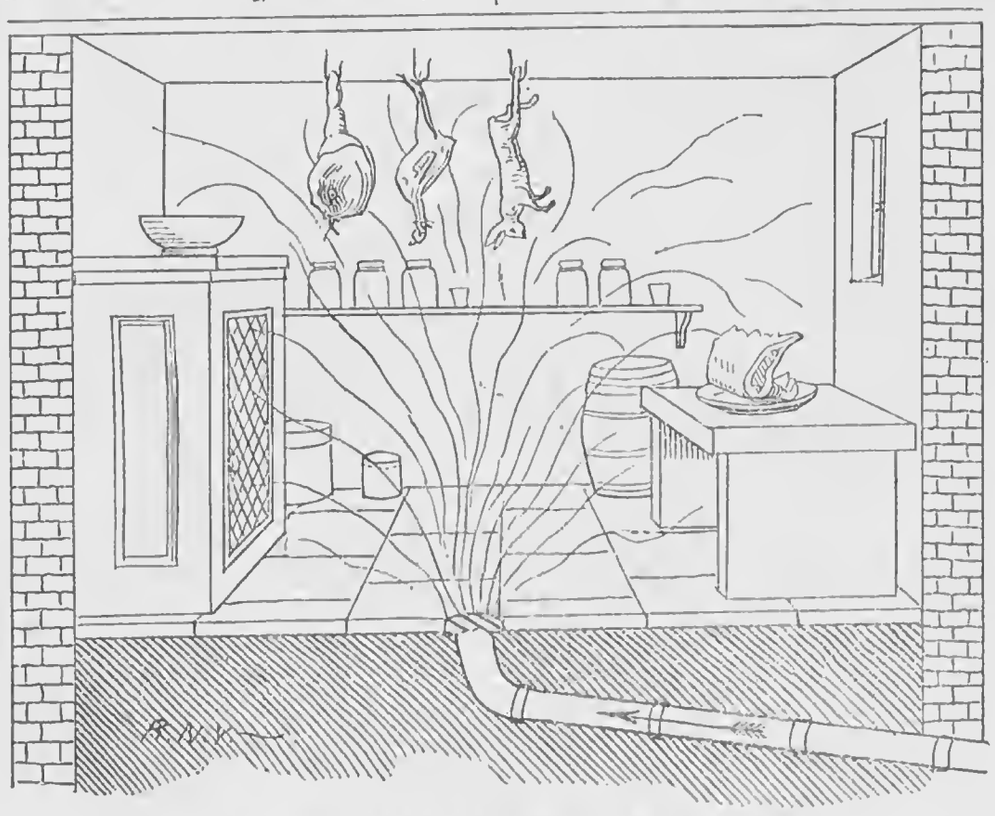
A cow is a delicate animal and the milk organs are the most tender part of the cow. A circumstance happened to me recently which shows how careful a dairyman should be with his cows. My cows are turned out into a yard for an hour at noon on fine Winter days only, and are there watered. By an oversight the cows were left out from noon until four o'clock, and one lay down on the frozen ground. The next day this cow fell off four quarts in milk. On looking for the cause, one side of the udder was found hard and inflamed and very tender. By immediate attention the disorder was remedied, but it was several days before the cow came fully up to her milk. The udder was gently rubbed with cosmoline (a preparation of petroleum) for 30 minutes and the swelling was removed in 12 hours. By neglect or oversight there would have been a case of garget, and no one would have known the reason. How many cases occur in this and other similar ways "unbeknownst."



A CESS-POOL LEACHING INTO A WELL.—FIG. 224.



WELL WATER DEFILED BY DRAINAGE.—FIG. 225.



FOUL AIR IN MILK AND PROVISION ROOM.—FIG. 226.

Animal Photography.

"Stockman" gave an interesting article on this subject in the RURAL of April 16, and I hope those who undertake photo portraits hereafter will heed his lesson. But, having no practical acquaintance with the subject, I wish to ask "Stockman," who has, whether a better, and in fact a more truthful, portrait of an animal could not be made by taking a front, a side, and a hind view? Then from these three sketches the portrait for the engraver could be made. It is well known that the point of an animal nearest the camera is usually given untruthfully; that is, in larger proportion than the one that is most distant. Now, by having three to draw from, taking the fore part from the first, the middle from the second, and the hind from the third, a truthful portrait would be insured. Now, as to the picture of Prince of the Realm, which "Stockman" exhibits as a sample of the way in which animals should be photographed: the hind-legs stand tolerably well apart, but it strikes me that the fore-legs are represented unnaturally close. It is possible, however, that I do not look at it aright. If not, I wish to have my error pointed out.

As to the bull itself, if this is a correct portrait, he has the great fault of a sway back, which I have rarely observed in this breed of polled cattle, although I have seen hundreds of them in Scotland. He is also somewhat short from the huckle-bones to the rump, and he has not a nice set of the tail. Do these faults characterize the living animal? A.

Hygienic Information.

CAUSES OF DISEASE.

MANY of the epidemic diseases, common to the country and city alike, are traceable to the presence of filth, in one form or another. The so-called "germ theory" throws much light on the causes, character and cure of such diseases as yellow fever, small-pox and diphtheria which are thought to be occasioned by the presence in the blood of certain minute, parasitic organisms which have their origin in filth, and which are capable of reproduction in the human system either by contagion or inoculation. The knowledge that these germs of disease, in many cases, enter the human system through the lungs or stomach, enables us to guard against them more effectually by taking precaution to remove or renovate the natural home where the cause of disease originates. The causes of much disease in the country, are the impure air arising from poorly constructed drains and ill-ventilated cess-pools, and the too close proximity of these drains and cess-pools to the wells from which water is daily used for drinking and culinary purposes. The accompanying cuts illustrate the point in question. As may be seen, the well is situated so near the house that the drainage from the kitchen sink and the cess-pool finds its way into it, defiling the water and making it the means of conveying disease germs to the human system.

Besides the almost unavoidable escape of the drainage into the wells, the cess-pool is a vast retort filled with foul matter and dangerous gases which often find no other means of escape than through the drain into the house. Better have the drainage delivered directly on the surface of the ground within 20 feet of the door than to have a cess-pool at that point. At Figure 226, is illustrated a milk and provision room, filled with impure air from an untrapped or unventilated sink. The "slops" and the washing of the floor, being thrown into the outlet, find their way to the cess-pool, but, as the cess-pool is not properly ventilated, the foul air and noxious gases find their way through the drainage pipe into the room, thus infecting the provisions and milk, making these unhealthful food. If, in the construction of drains and cess-pools, more care were taken as to their situation and ventilation, much disease and sickness would be averted. "An ounce of prevention is worth a pound of cure."

Miscellaneous.

A Cleanly Plan of a Cow Stable.

Always on the outlook for plans and suggestions that may be of use to our readers, we re-engrave for their benefit from a late issue of the Agricultural Gazette, England, the ground-plan of a cow stable represented at Fig. 227. The building, a portion of which is here illustrated, belongs to Mr. Tisdall, of Horton Manor, Epsom, about a dozen miles from London, and the firm of Tunks and Tisdall, of which he is the second partner, is one of the leading concerns engaged in supplying London with milk. All the arrangements and equipments of the structure are distinguished by neatness and thorough cleanliness. The cows stand on a bed of rammed chalk in front and of bricks behind, back of which runs a gutter. The entire arrangement is sufficiently explained by the engraving. Of course, in presenting to our readers various plans of farm buildings, etc., we neither expect nor advise that all or any of them should be followed exactly; but we do expect that the cuts will afford our friends useful ideas and suggestions for the construction of such buildings as they may from time to time require.

THE BUFFALO-BERRY.—A friend sends us a package of Buffalo or Bull-berry seed all the way from Fort Abraham Lincoln Dakota Territory, and says that if we succeed in growing it the plants will be quite ornamental, as the berries remain on nearly all Winter. There it is found on sandy soils, on which it appears to thrive better than on any other. The botanical name of this plant is Shepherdia argentea; it is of the natural order of Oleaster, and grows from 12 to 18 feet high, the fruit is usually scarlet and about as large as currants,

RURAL BRIEFLETS.

We have received a copy of Henderson's Handbook of Plants—a handsome volume of over 400 pages about ten by seven inches in size. The object of the work is to supply a dictionary of those genera and species of plants to which amateurs, or indeed professional, gardeners and florists or even farmers, have frequent occasion to turn as a book of reference. We have many such works—most of them, however, published in foreign countries and therefore not to be accepted as trustworthy guides in this country as regards methods of propagation and culture. In order to give the reader a more concise idea of Mr. Henderson's book, let us suppose he desires information respecting the Osage Orange. Not knowing or remembering the botanical name, he turns to Osage Orange (the arrangement is alphabetical), page 153. He is directed to Maclura, page 125. Here we find the following:

"Maclura—Osage Orange. Named after William Maclure, a North American geologist. Nat. Ord. Moraceæ. A genus of handsome, low-growing trees, generally attaining the hight of 30 feet. There are but three species included in the genus, two of which are common in the West Indies, and not hardy here, excepting in the extreme Southern States. M. aurantiaca, the Osage Orange, is a native of the Southwestern States and forms a spreading tree from 30 to 60 feet high, but easily kept dwarf by cutting back, and extensively used as a hedge plant in the Western States, for which purpose its rapid growth, together with its strong spines, renders it suitable. The wood is bright yellow and very elastic. It is called Bow-wood from its being used by the Indians for making bows. Young plants are grown from seed, which, if sown in good soil, will make very strong plants for the hedgerows in two years. Many prefer setting them one year from seed. This species is hardy in the vicinity of New York and is used for hedges and on the lawn."

Thus corn, wheat, oats and all field crops are treated as well as the leading vegetables, flowers, shrubs and trees of the garden or lawn. About 150 pages of the work are devoted to definitions of botanical and technical words, presented in large print. This handbook of plants is, in brief, a judicious selection from such books as Paxton's Botanical Dictionary, Gray's Manual, Chapman's Southern Flora, Lindley's Treasury of Botany, Miller's Gardeners' Dictionary and others, of much that is adapted to the needs of this country—re-written and presented in a compact and convenient form. We are glad to recommend this book as one which may well find a place in the library of all who are interested in plant life, let them be botanists, florists, gardeners or farmers.

Mr. Henderson is himself the publisher, and he has wisely made the price so reasonable that it should not stand in the way of the extensive sale it well merits. The book is announced in our advertising columns. . . . .

Those of our readers who have hardy vines to plant should not forget the beautiful clematis. There is no other vine that bears such beautiful flowers. They are borne also in great profusion and the colors range from lilac to deep purple—almost black—through all shades of blue, white and rose. . . . .

Nothing can be more striking in the floral way than arbors covered with clematis vines which bloom at the same time, bearing flowers the colors of which contrast the most effectively with each other. Arbors, however, are not necessary. They may be cultivated in flower beds the same as what are known as bedding plants, and left to trail and intertwine upon the ground. It is easy by clipping to confine them within the border. . . .

Among the best of the early bloomers bearing their flowers upon their old wood are Fair Rosamond, rosy-white with a reddish bar; Sophie, lilac; Stella, light violet with a plum-colored bar. Among Summer bloomers flowering on the old wood and bearing *double* flowers may be mentioned the Duchess of Edinburgh, pure white in color, and Fortune's Clematis (C. Fortunei), creamy white, sweet-scented and of a rosette form.

Among the later bloomers which bear their flowers upon short, lateral Summer shoots may be mentioned Clematis Henryi, bearing large (single) white flowers. We have measured them over six inches in diameter; C. Lawsoniana, rosy purple, and C. Symeiana, lavender blue. Clematis velutina purpurea bears flowers—and many of them—of the darkest color of any with which we are familiar, being of a blackish mulberry. This and Jackmanni bloom from late July to October. Jackmanni is of an intense blue or violet and is not yet surpassed by any of the newer varieties. .

A good deal has been said first and last of the Thermal Belt of North Carolina in these columns. A subscriber, Mr. A. Braman, living upon the side of the Tryon Mountain, writes us that peach buds have been damaged by frost owing to the cold, backward Spring. According to Dr. McAboy, who lives at the foot of Tryon, this has not occurred before in many years. . . . . .

Mr. Braman also writes us that he uses wild grape roots upon which to graft the cultivated varieties. . . . . .

We have received quite a number of letters criticising our remarks in opposition to barb-wire fences. One of these comments is as follows: "I think you will find yourself mistaken in regard to barb-wire fencing. As far as my experience goes, stock will let it alone and you cannot *drive* them on to it. If my farm were fenced with it, the snow would now be all gone, as there would be no drifts. As it is, the drifts are from one to three feet high." . . . . . .

We do not profess to speak from experience, and merely wish to arrive at the truth for the benefit of our readers. . . . . .

Among the many pretty annual vines seeds of which may be sown now, the Balloon Vine, Cypress Vine, Loasa, Sweet Peas, Nasturtiums (Tropæolum), Canary Bird Flower and Morning Glories may be mentioned. The Adlumia cirrhosa is excellent for rockeries or hot situations the first year, low-growing and fern-like as it is. It is a biennial and does not grow to vine or bloom until the second year. This is the Mountain Fringe of the rocky hills from Canada to North Carolina.

What Others Say

Mr. Mills, of New Jersey, uses covers of two-inch-thick spruce plank, tongued and grooved for his silos as covers for the ensilage. These in length are two inches shorter than the width of the silo and they are made in sections but four feet wide. As the ensilage is used, the covers are removed one by one, each exposing a surface four feet wide. Mr. Mills, according to Harper's Weekly, weights down these covers by distributing on the top of the planks fifty tons of grain or ground feed in bags, which he afterwards uses to mix with his ensilage at the time of feeding. He suggests in case grain is not handy, that barrels be filled with gravel or sand and used for the same purpose.

A thoughtful article in the Husbandman of Elmira reviews somewhat the services of previous Commissioners of Agriculture and the general inefficiency of the Department up to the time when Gen. Le Duc was appointed, four years ago. The article concludes as follows:

"Now with a new President there comes a cry for change of Commissioner. There are politicians to reward, and the places are coveted. Let it be noted that farmers are not asking that Gen. Le Duc be removed. On the contrary, they have spoken by thousands and tens of thousands in behalf of the present incumbent. They want him retained. The National Grange, a representative body, comprising members from every agricultural State of the Union, has made a formal request in writing, to which is appended the signature of every member of that body, for the retention of the present worthy and efficient chief of the Department of Agriculture. Other societies, clubs and associations founded on agriculture have repeated the request. Will their prayer be heeded? Will President Garfield remove the man who more than any other on this continent is approved by the farmers for great service rendered? The question is full of interest, not free from anxiety. Manifestly the country desires that Gen Le Duc be permitted to carry to their fruition plans inaugurated in behoof of an industry shamefully neglected in the past by the government that derives from it its chief support. Farmers so desire, if their voice is truth, as it must surely be since their representative bodies have displayed great interest in maintaining the efficiency of a service now for the first time in the history of the Department exerted with the specific object of promoting agriculture. The score or more of aspirants for the place redeemed by the present occupant from merited disgrace, have each local support—none of them more in a broad sense—while Gen. Le Duc is earnestly supported by good men in every agricultural community throughout the land. With what effect time will reveal. Let us hope that the disheartening influence of change may be averted by a timely declaration by the President, that merit shall be recognized, and the good servant approved.

To talk of any wheat being "virtually rust-proof" is nonsense, says the Mark Lane Express (London). Rust, like the potato-disease, will attack any variety of its host plant, though some varieties are less hospitable than others. For instance, a wheat with extra hard chaff-scale and straw offers greater resistance to rust than a soft-strawed wheat.

Oats are considered a hard crop on the land by most farmers, remarks Henry Stewart. This, however, will not bear the light of scientific examination, or even of careful observations. For, if we come to look into the composition of the inorganic elements of this grain, its ash, in fact, which is all that it takes from the soil, we find that it is not half so exhaustive as wheat, and where a crop of 25 bushels of wheat may be grown, at least 80 of oats may be taken with no more draft on the soil. Let us compare the following figures:

Composition of Ash of	Wheat.	Oats
Potash	31.1	15.9
Phosphoric acid	46.2	20.7
Soda	3.5	3.8
Magnesia	12.2	7.3
Lime	3.1	3.8
Silica	2.4	46.4

And we then see that 100 pounds of oats take from the soil half as much potash and less than half as much phosphoric acid as 100 pounds of wheat, and the great bulk of its draft on the soil consists of silica, of which there is a great abundance. This peculiar composition makes oats a crop adapted for light soils upon which wheat would not succeed.

An invaluable class of Summer-flowering plants, says Mr. W. C. Barry, are the delphiniums, or larkspurs, which exhibit a wonderful variety of beautiful colors and shades from pale blue to black. In the mixed border they are superb. Tall and conspicuous when in flower, they never fail to arrest the attention of even the most unobserving. Their culture is easy, and, like other perennials, they can be increased by division in the Fall. The following are choice tall varieties:—Ivanhoe: bright blue, double, superb; Louis Agassiz: blue, with purple center, double, very striking; Mrs. Goodell: dark blue, with purple center; Cœlestinum: very light blue, beautiful, double.

Swindling in Oleomargarine.—Every time a jobber sells a tub of oleomargarine as butter to a retailer or the retailer sells a pound of it to a customer as butter, he is defrauding his customer of the difference between the price of the genuine and the bogus butter, says the N. Y. Grocer. . . . . There is no system of business or any other kind of morals that we have ever heard of that admits that it is right for a man to put his hand in another man's pocket and take money out of it, and yet when a merchant sells oleomargarine for butter he does in effect precisely this thing. . . . . There is only one retail store in the city that we know of where oleomargarine can be bought as oleomargarine.

It is very useful and instructive for a farmer to go abroad occasionally and see what other farmers are doing. When one stays too much at home he is apt to think that his own neighborhood is the center of the universe.—N. Y. Times. . . . . A farmer writes to the Elmira Farmer's Club to condemn White Australian Oats. He says:

"White Australian Oats for seed are advertised this Spring. Touch them carefully, is my advice. A small package was brought from the Centennial Exposition and carefully nurtured until, last year, I sowed four acres of ground from the product. They were given the best part of the field, but only yielded 35 bushels to the acre, machine count, whereas the balance of the fourteen-acre lot sowed with the Yellow Golden Oat long in use, gave 61 bushels. Allowing for the great weight of the new variety, the aggregate cost of the experiment I figure in round numbers at 80 bushels. The Australian oats made the better appearance while growing, and the cleaned grain is a beautiful sample, but they have a hard shuck and I want no more of them."

The pointed comment of President McCann, says the Husbandman, was: "This is the honest expression of opinion by a man who knows."

[We have seen half-a-dozen different kinds of oats called Australian, merely because they came from Australia. We have known them to weigh as high as 52 pounds to the bushel, and as low as 34.—Eds.]

Mr. G. W. Hoffman, said: "A deep cellar with double walls and air-space between is a safe receptacle for milk. I know of such a cellar made for keeping fruit, and it has cool, dry air so that matches kept in the cellar may at any time be picked up and ignited by friction no greater than is required when they are kept in any other room of the house."

It may be said to be the greatest waste of the farm that costly implements rarely receive the care they should. . . . . It should always be borne in mind that the profit of farm machinery rests chiefly in the proper care and use of it. Hence it is that improved farm implements are not profitable investments to some, while to others they pay for themselves over and over again. . . . . Is the race of American Statesmen extinct?—Husbandman.

BOOKS, CATALOGUES, ETC.

We have received from the worthy Secretary, Robert Manning, Salem, Mass., the Proceedings of the American Pomological Society at its Rochester session in the Fall of 1879. It would be difficult to do justice to this valuable work in a brief notice of this character. We use it as a book of pomological reference during the entire year and it is to us next to invaluable. The address of its venerable president, Marshall P. Wilder, is full of eloquence, enthusiasm and love; the essays and correspondence are admirable in their way. The following is from Mr. Wilder in answer to a note from us.

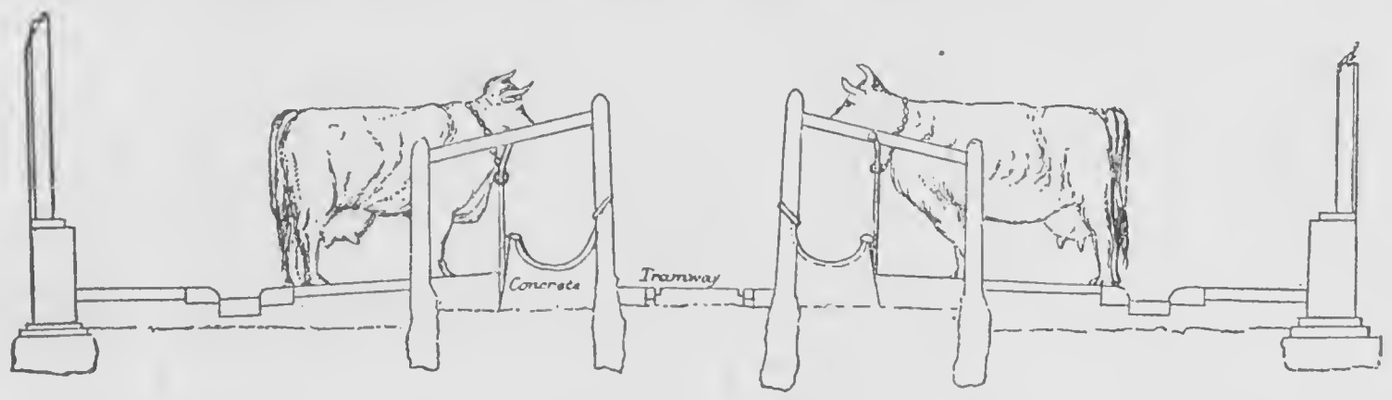
"The American Pomological Society was the first national society in the world, and has been followed by similar societies in Europe. It embraces the United States, Canada, and Nova Scotia, has held its meetings in the various great cities of our country from the Atlantic to the Mississippi. The 18th annual meeting is to be at Boston, the home of its old President, on Sept. 14, '81, when it is expected there will be, as on all its meetings here (this is the fourth), a grand gathering of the pomologists of America. The volumes of the society contain a vast amount of information in the Reports, etc., etc., and a catalogue of pages with lists of the fruits adapted to 50 States, Territories and districts, and columns of each prepared by the able Gen'l. Chairman of the Fruit Committee, P. Barry, a work of great care and experience. The present issue is a noble illustration of American enterprise, and was prepared by its Secretary, Mr. Manning, than whom no man is better qualified practically, scientifically and critically."

"Brief Essays on New Fruits, Ornamental Trees and Plants," is the title of a little book we have received from Mr. Wm. C. Barry, of the Mount Hope Nurseries, of Rochester, N. Y. It comprises 60 pages, and is filled with his own careful observations upon the subjects treated. Most of the essays were originally published in the Albany Cultivator, others in Moore's Rural Life (not published now), Rochester Democrat, Gardeners' Chronicle of England, etc. We are very glad to see this young gentleman, by education and by nature, proves himself so well fitted to maintain the well-earned reputation of this good old house. The pamphlet will be mailed prepaid for 25 cents. "Weeping Trees," "Herbaceous Pæonies," "Native Fruits," "Notes on Peaches," "Notes on Desirable Fruits," "Some of the Best Hardy Roses, with brief Hints as to Culture," "Vines and Creepers," "New Fruits in 1879," are among the essays presented.

Another Book on Ensilage.—"Please examine this book," says Mr. H. R. Stevens, the author, "and give it a good notice in your paper. I shall advertise it thoroughly in every agricultural paper in the U. S. You will notice that it is elegantly bound in cloth and is sold at the extremely low price of 50 cents."

The book opens with a cut of Blount's Corn, which is throughout the book commended as the best variety for ensilage purposes.

We have next a portrait of "Yours truly, H. R. Stevens." We have then a few remarks by the author and the rest is a series of correspondence with those who have investigated the system theoretically or practically. Nothing of importance is said in the book, as we can glean, that has not been said in the Rural New-Yorker. We are afraid that Mr. Stevens will not find the above such a review of his handsome little book of 120 pages as to induce him to include the Rural in his advertising



FLOOR OF A COW-STABLE.—FIG. 227.

list of agricultural papers. Sorry! The book is published by the author, 464 Broadway, Boston.

SECOND REPORT of the U. S. Entomological Commission on the Rocky Mountain Locust. This volume of 322 pages, issued by the Department of the Interior, relates chiefly to the labors of Messrs. A. S. Packard and Cyrus Thomas in their efforts, in 1878 and 1879, to discover some permanent means of preventing the excessive increase of the Rocky Mountain Locust in its native habitat and its migration therefrom into the more fertile portions of the trans-Mississippi country. The work is profusely illustrated with colored maps of the Western territory infested by the pest and with numerous diagrams relating to it.

JOHN S. CARTER, No. 28 and 30 James St., Syracuse, N. Y.—Illustrated catalogue of all kinds of apparatus and supplies for cheese and butter factories, creameries and dairies. Sent to our subscribers on application to Mr. Carter as above.

LIFE-SAVING Service Report for the fiscal year ending June 30, 1880. Issued by the Treasury Department.

ACTION of the New York Produce Exchange relative to canals—a six page pamphlet advocating free canals.

ISTHMUS SHIP CANALS, a speech of Hon. W. Windom, of Minn., advocating Eads's Ship-railway at Tehuantepec.

SUGAR BEET CULTURE and manufacture of Beet Sugar—a 20-page little pamphlet issued gratis by Gladden & Curtis general selling agents of the Pacific Guano Co.

Everywhere.

RURAL SPECIAL REPORTS.

ARK., Beebe, White Co., April 12.—We have a very late Spring. How the fruit will stand it is more than I can tell just now. Peaches began to bloom about three weeks ago. The blackberries are killed, though hitherto they always bore heavy crops. The last-picked cotton is selling for from 4 to 6 cents per pound, so that it does not pay nearly the cost of raising it. We finished sowing oats ten days ago; all the seed comes from the North. H. B.

CANADA, Fernhill, Ontario, April 9.—We have had a very steady Winter. It commenced on the 20th of November, and it was very severe; sometimes the thermometer registered as low as 36 degrees below zero, but the snow did not come very heavily until about the last of February; since then we have had occasional high winds sometimes accompanied with snow. Our Spring is very late; the frost is not out of the ground yet. But for the two last days the sun has been very hot, and the weather has looked more like Spring than any we have had yet. The cold has killed all of my rose bushes right down to the ground, except a very few which were covered with snow; everything else in the garden has done very well. The yuccas have wintered splendidly. Did you ever hear of chrysanthemums out-of-doors? I left some out last Winter, and they looked splendid after the leaves were removed to-day. It was a Chinese variety. Winter wheat does not look very well at present, as there was very little growth last Fall, it is only in exceptional places that it covers the ground; but we may have a very good crop yet if it is not heaved out by the frost. Feed is getting very scarce with some who thought that we were to have an early Spring and fed heavily at the start and wasted a great deal. It was a hard Winter on bees; there are very few stocks alive in this neighborhood, which will make people a little more careful in the future. Some of the peach buds are injured by the frost and others look all right. J. M. W.

CANADA, Province of Quebec.—We have still cold weather and plenty of snow. No hot-bed made yet. A. L. J.

FLA., Waldo, Alachua Co., April 12.—We have had more or less frost since the middle of December, the thermometer on one occasion going down to 16 deg, and ice forming three inches thick. In November I had around my house a large number of Australian forest trees, including some specimens of Eucalyptus globulus nearly thirty feet high; but all, with only one exception, are completely killed. The only evergreen trees or shrubs that seemed to withstand the season were the Cape Jessamine—Gardenia—and the Loquat-tree—Eriobothrya. The orange trees lost their leaves and sometimes all the young shoots, and plants which flourish indigenously in 43 deg. south latitude perished here in 29 deg. 30′. Bananas are, of course, cut off. I heard more than once that 25 miles south of this the oranges were not affected; but I got some of the fruit from that section and found that it, too, had been well frozen. In many instances cotton must be resown, the young plants being quite killed. Corn is also being sown by some a second time for the same reason, though a few farmers are abandoning the crop this year for rice. But although the Winter has been thus severe and in many respects injurious, the cold has doubtless done much good. Whole armies of insects must have disappeared and if the orange crop should be a little diminished this year, we are confidently looking forward to a great increase in 1882. The effects of the cold are rather peculiarly visible. Taking, for instance, a radius of, say, five miles from where I write, some gardens are utterly ruined and others hardly touched—this, too, without any very apparent cause. And the same, I am informed, is true throughout the State. I have a piece of land in common Dent corn, which must be resown, a few plants only having survived, while 200 yards away is a patch of sweet corn—Early Minnesota—that looks well. The plants are 14 inches high; they are strong and growing fast, only one here and there having felt the cold. Mold's Ennobled Oats received from the RURAL and sown in October are fine. I sowed them very thinly in well prepared soil, and they are now about three feet high, with leaf-blades more than an inch across. Measured an inch above ground, the plants have tillered out over circles varying from six to fourteen inches in diameter. The ground has been worked once only since sowing, with a hand cultivator. It is light and sandy and was fertilized from the cow-yard. My White Elephant Potatoes, also from the RURAL, are now in blossom. They are very luxuriant above ground, but not too much so. They have not felt the frost, though even the turnips a few yards away have shown that they did not like it. If the experiment be thus far any indication to go by, it would seem that the White Elephant resists cold better than the Rose. My Italian onions have been growing right through the Winter quite unheeding the weather and a recent change to more genial climate has made our gardens a mass of color with blossoms of verbenas, pinks, carnations, petunias, etc.—these last often three inches in diameter. Rice promises to be a great crop in this State. Three years ago it was hardly recognized. This year it will be largely sown. It withstands heat and rain better than anything else; it grows more freely and with less trouble on even poor land, and the longest-headed farmers are looking forward to rice becoming, ere very long, one of the staple products of the State. With care we can grow quite as good a sample as can be produced in South Carolina or Georgia. A. I. E.

ILL., Champaign, Champaign Co., April 10.—Though beginning late in October, the Winter in these latitudes is not over and occasional snow banks lie along the north sides of fences and timber belts. There is scarcely a sign of starting vegetation and the pastures and meadows hardly show a tinge of green. No plowing nor seeding has been done to amount to anything, but teams will be started Monday if storms do not come. There is a scarcity of all or nearly all agricultural products, and prices are steadily on the rise. For the entire State the country is shorter than for ten years of fat and stock hogs, butchers' stock, and No. 1 fat cattle, corn, hay, straw and "roughness" generally, vegetables of all kinds, eggs and poultry. Wheat is worth $1; corn, 35c; oats the same; rye as much as wheat; hay, $10 @$12 per ton; potatoes, $1@1.25; hogs, 5c; butchers' stock, 3½@4c. and for fine No. 1 fat stock nobody knows what would be bid. In short, for the last three or four years, agricultural products have been overestimated from 30 to 50 per cent. and the result is unexpected shortages along the whole line. The wheat crop north and south in this State, has been very seriously damaged, and the general estimate is not over half a crop. It has been ascertained that the hog crop is short 780,000 hogs and pork products are on the boom. B. F. J.

ILL., Edwardsville, Madison Co., April 11.—We have a very backward Spring. To-day only about one-half the oats are sown and hardly any potatoes are planted. Weather cloudy, damp and cold. Peaches, apricots and small fruits will be a total failure, except strawberries, which promise a good crop. Apples look all right. Wheat has suffered more than was at first expected—fully 20 per cent. has been frozen out. The acreage sown is 25 per cent. more than last year. Late-sown wheat has suffered the most, owing to the Winter setting in so early. C. P. B.

ILL., Highland, Madison Co., April 9.—We have never before seen such a long Winter. It is snowing again to-day after a big rain. Wheat looks well enough now; it has been killed in a good many places, however; some say they will have to plow much of their wheat land and put corn in. Wheat is worth $1 per bushel; corn, 35c.; oats, 30c. After such a long Winter many farmers are out of fodder and consequently cattle are suffering. C. S. R.

ILL., Dover, Bureau Co., April 4.—Snowing again to-day. Many roads blocked up so as to be impassable. Very little sunshine for the last four months. I've been in this State 34 years, and this is the hardest Winter I've ever seen here. C. A. T.

IOWA, Atlantic, Cass Co.—April 12.—We have had a very cold Winter, it froze up in November and has been steadily cold ever since. The ground has been frozen four feet deep this Winter. On the first of April the snow was all gone; now there are 14 inches, and, it is still snowing. The thermometer went 30° below zero at one time during the past Winter. Small fruits of all kinds are killed as far as I can find out. All sorts of stock have wintered well. A considerable amount of corn remains in the field yet. Corn, 27 cents; wheat, 85c; potatoes, 60c; butter, 20c; eggs, 12½c; stock cattle for feeding $4 per hundred; fat hogs, $4.60 per hundred; hay, $10 T. H. H. B.

IOWA, Cherokee, Cherokee Co., April 12.—Plenty of snow. No getting into the cornfields yet. No Spring work done. E. E. W.

KAN., Alamota, Lane Co., April 14.—We have a very fine country here, but every family coming should bring enough to "run" them at least one year. The past Winter was quite severe. The loss of cattle on the range was about 10 per cent. Weather now pleasant and prospects good for the season. N. R. V. D.

KAN., Norton, Norton Co., April 8.—Our Spring is tardy; we had snow yesterday. Patches of old snow are yet to be seen in the heads of the "draws;" still most of the ground is bare and people have been "breaking" and plowing for some time. Weather cool most of the time. Grass started. D E S.

MICH., Georgetown, Ottawa Co., April 3.—It is Winter here yet. Heavy frost every night; as cold as Midwinter, thermometer several degrees below zero, and snow about 12 inches all over the country, and the hopes for fruit very poor. H. A.

NEB., Orleans, Harlan Co., April 10.—Wheat nearly all sown. Owing to failure of crops last season nearly all seed is imported. With commendable liberality the B. & M. R. R. makes no freight charge on imported grain designed for seed. Congress made a special appropriation to procure seed for a portion of this State and Kansas. Harlan County's quota came last Saturday; a mail-sack full of small packages of Defiance Wheat—"only that and nothing more." It will not put one nickel in any one's pocket this year and another year probably we shall be beyond want. To hundreds it is yet an unanswered question; "How can we procure garden and field seeds?" It seems to us as if the $20,000 appropriated for seeds for this section had been spent in Washington red tape. A Farmer's Alliance is well attended in this village. R. H. C.

N. Y., Waterville, Oneida Co., April 10.—Good butter 28c. per pound and scarce at that; eggs, 16@18c. per doz.; hay $14@16 per ton. Wages $18@22 per month, with board; $1.25 @1.50 per day, without board.

OHIO, Columbus, April 12.—The morning of the 28th of March found a violent snow storm raging, and more or less snow fell every day for eight days thereafter, making a total fall of a foot or more, while the thermometer dropped to January weather on the mornings of the 5th and 6th of April. The drifts are not yet quite gone, but are going with rain, so that it will be another week at least before the plow can be started in stubble ground, and the probabilities are that it will be the last week in the month before any Spring grain or potatoes can be got into the ground, as almost no plowing, and quite no planting had been done before this second Winter set in. All this means poor crops of oats and potatoes, late gardens, hurried preparation for corn, and, consequently, a poor seed bed, while the outlook for this crop is rendered still more gloomy by the probability that the germinating power of a large part of last year's crop has been destroyed by the early and severe cold, just as it was during the Winter of 1878-79. Wheat started into the Winter in poor shape, owing to the dry Fall, and the drying winds of the latter part of March were not improving its condition, but the heavy snow has been of great benefit both to it and the young clover, for which the prospect is fine. The wages of farm hands have advanced from 10 to 25 per cent., owing to the stimulus of "good times," and altogether the outlook is not favorable for a money-making year for the farmer. C. E. T.

PA., Baden, Beaver Co., April 10.—Wheat is not looking as well as last year; acreage about the same. Of fruit there is a poor prospect; peaches are entirely killed. Cherries are killed in most cases. Apples, I believe, are not hurt; but as we had a large crop last year, we cannot expect many this. Some people think apples will not pay in the future, as the price is so low. What is your opinion on the subject? [The taste for good fruit is increasing even more rapidly than the population; and the raising of good apples is, we think, likely to pay proportionately as well as the raising of other crops.—EDS.] The prices of farm products are: wheat, $1.08; rye, $1.14; corn, 60c.; oats, 50c.; potatoes, 90c. to $1; apples, 40c. to 50c.; hay, $23 per ton; butter, 30c; eggs, 20c. Pittsburg is our nearest market—a very good one in most cases. F. W. S.

TEXAS, Caldwell, Burleson Co., April 9.—There has been a great deal of cotton plowed under. There will be a large crop of cotton raised this year, and pickers will be in demand next Fall if the season is favorable. Corn was a heavy crop. A great deal was wasted on account of sickness. All was not gathered last of March. Oats also were a heavy crop. Wheat was not of much account. Late frosts have damaged the peach crop on low lands; on prairie there will be a fair crop. The mast lies thick on the ground yet and stock hogs are unwieldly masses of oil. Corn has five leaves and cotton is large enough to chop out. Some years corn is three feet high on good land by the 10th of April. Bacon, 8c; corn, 40c; oats, 60c. D. H.

TEXAS, Agr. Coll., College Station, Brazos Co., April 16.—Crops throughout the State were damaged by frost on the 14th inst. The day previous the thermometer registered 78 degrees in the shade. C. C. G.

The Querist.

ANSWERS TO CORRESPONDENTS.

Brewers' Grains and Distillers' Grains.

R. H. L., Monsey, N. Y., asks, 1, what are brewers' grains; 2, are they healthful food for milch cows; 3, what is an analysis of them; 4, how do they compare in value and price with other sorts of food for milch cows; 5, how to keep them; 6, what is the value of the grains for manurial purposes; 7, what are distillers' grains and what is their value as food for stock.

ANS.—Brewers' grains are the exhausted barley of a brewer's mash. In the preparation of malt liquors from grain, the starch contained in the latter is converted into sugar by the action of a peculiar ferment called diastase, contained in the malt, and this sugar being fermented, yields alcohol. In this process the starch is almost the only thing extracted. Now starch is a carbohydrate or heat-producing food, while the quantity and quality of milk depend mainly upon the albuminoids—nitrogenous or flesh-producing foods—and these are not at all withdrawn from the grain in the process of brewing, as can be readily seen by microscopic examination which shows the gluten cells intact, while the starch is nearly all dissolved out of the tissues that contain it; so that the residue is relatively richer in albuminoids than the whole grain. 2, If fed in moderate quantity as part of a ration and while fresh, they are good food for milch cows or fattening animals; but they are not adapted for animals that have to perform severe work. If fed to milch cows heavily or when stale, they will injure the quality of the milk. 3, Brewers' grains are much more watery than the original grain, containing only about 24 per cent. of dry matter. Of them Prof. S. W. Johnson gives the following analysis:

Water	2.57
Albuminoid or proteine	20.38
Fat	6.40
Carbo hydrates (starch, sugar, etc.)	54.89
Fiber	11.79
Ash	3.97
	100.00

Dr. P. Collier, Chemist of the Department of Agriculture, gives the following analysis of brewers' grains and oats:

	Brewers' Grains.	Oats.
Water	10.2	11.8
Albuminoid or proteine	21.7	9.8
Fat	6.6	4.9
Carb. hydrates (Starch, Sugar, etc.)	43.9	58.0
Fiber	14.9	12.5
Ash	2.7	3.0
	100.0	100.0

When corn meal is used in the brewing, it considerably enhances their value as food for cows, and would make the grains show about the following: Proteine 5 20, fat 2 10, starch 18.50. 4. The relative cost of brewers' grains and other sorts of feed will vary, of course, with the season, the ratio of demand and supply and the freightage. In a recent argument before a Senate Committee investigating the healthfulness of these grains at Albany, the following relative values of 100 pounds of different kinds of food was given by the advocate of the grains:

		Proteine.	Fat.	Starch
Brewers' Grain	$ .25	4.73	1.50	14.29
Timothy Hay	1.00	3.02	1.57	48.58
Clover Hay	.75	7.83	1.48	39.71
Corn Meal	1.12	6 23	2.89	66.90
Cotton Seed Meal	1.30	33.00	10.89	12.65

This table shows that the proteine (albuminoids, flesh and milk-making elements) in brewers' grains and cotton-seed meal can be bought for about $3 75 per 100 pounds, while in corn meal it costs nearly $5 per 100 pounds, and in timothy hay $6.70 per 100 pounds. 5. As stale grains are objectionable feed, a fresh supply should be procured as often as conveniently possible. They should be kept in tight casks or other vessels each large enough to hold one day's feeding—one for each day between the dates at which the grain is received—as described by Professor L. B. Arnold, in the RURAL of April 9. The contents of these should be pressed down with heavy weights on movable covers, so that the pressure will be constant. A covering of water will exclude the air, and so aid in the preservation of the

grains. Salt sprinkled over them in Summer will prevent flies depositing their eggs on them and breeding maggots. They may also be kept in air-tight silos or pits, the same as green fodder; but owing to the inevitable access of air on the opening of these at feeding time, the other is the better method. The manure from animals fed on brewers' grains is considerably richer than ordinary barnyard manure, the ashes containing eleven per cent. of phosphoric acid and nine per cent. of potash. 6. One thousand pounds of brewers' grains contain 260 pounds of dry matter; of this 8¾ pounds are nitrogen, ½ pound potash, 1½ pound lime, 1¼ pound magnesia and 3½ pounds phosphoric acid. The value of these at the current rates is about $2 40, which would make the manurial value about $4.80 per ton. At the usual price of 10 or 12½ cents per bushel of 60 pounds, a ton would cost from $3 30 to $4. If applied fresh to the soil a great part of the value would be lost unless they were used in the hill with crops planted in that way. If composted with manure or earth with wood ashes or lime they would be made more effective.

7. The first stages of the process of manufacturing distilled liquors are essentially the same as those in the preparation of malt liquors, but after the fermentation, the mash is subjected to distillation to separate the alcohol. The residue remaining in the still constitutes distillers' grains or "slump." This has nearly the same composition as brewers' grains, except that it is much more watery, as it contains only about eight or nine per cent. of dry matter. Like brewers' grains the "slump" has lost chiefly its starch or non-nitrogenous substance, and is therefore a valuable addition to fodder poor in albuminoids. It gives good results in fattening or feeding for milk when properly used; but it is not found well suited for sheep, hogs or horses. In feeding these grains their watery nature should be borne in mind, and the health of the animal requires that they should be fed with some other fodder, like hay or straw. Much of the prejudice against "distillery slops" arises from the exclusive or almost exclusive use of the "slump" for feed, and from the usually filthy surroundings of the animals fed thereon, rather than from anything injurious in the stuff itself.

Foxtail and Hungarian Grass.

R. H. C., Harlan Co., Neb., asks, 1, the relation between Hungarian Grass and Foxtail Grass. The idea prevails thereabouts that millet and Hungarian are perfected Foxtail, and may therefore degenerate into Foxtail. 2, On Western soil extremely rich in all needed minerals, though somewhat deficient in vegetable mold, cannot a rank growth of Foxtail be utilized by plowing it under? 3, Can the area mowed once be profitably mowed again in the same season? 4, How should the grass be treated? 5, What would be the effect of shallow plowing.

ANS.—1, Both belong to the Gramineæ or Grass Family, but Foxtail is Setaria glauca and Hungarian, Italian Millet or Bengal Grass, is Setaria Italica, and the one would be no more likely to degenerate into the other than Trifolium pratense, Red Clover, would be likely to degenerate into T. repens, White Clover. 2, A rank growth of Foxtail may and should be utilized by plowing it under before it perfects its seed. 3, If this is done some time in June, and the land is thoroughly harrowed and rolled, another crop will frequently spring up and grow large enough to be of some value to cut for hay, by September. 4, Treat the product in curing the same as any other hay. 5, One shallow plowing will have no bad effect whatever on the land; it may effect the first crop following. We would not plow either late or shallow in order that the seed of the first crop should germinate to produce the second. There are usually enough dormant seeds in the ground to produce half-a-dozen crops. Thirty-four experiments with seven different soils, at the Cornell University farm, gave an average of 336 self-sown plant seeds that germinated in the first two inches of soil in each square foot, or 14½ million seeds per acre. (See first annual report of the Cornell University Experiment Station, 1879-80.) For comparison we might say that one peck of Timothy per acre gives about 87 seeds per square foot; the same amount of clover seed gives about 58 seeds per square foot.

A Cord of Manure; Sowing Clover in Corn Ground, etc.

C. H. D., Occoquan, Va., asks, 1, what is a cord of manure and how is it measured; 2, how would it do to sow clover on corn ground at the last working—would the ground be shaded too much; 3, is his White Elephant which resembles an Early Rose, the genuine article or has it been changed in the mail as the packet was received open; 4, should it be planted now—as it is sprouting—or kept until the usual time for planting potatoes thereabouts—June 15.

ANS.—A cord of manure is a compact heap eight feet long, four feet wide and four feet high containing 128 cubic feet, or precisely the same as a cord of wood or a cord of stone. The weight of a cord of manure is very variable and depends upon the water in it. The organic matter is lighter than water, and, when comparatively dry, horse stable manure weighs about 4,800 to 5,000 pounds. Waring in his Handy-book of Husbandry says a cord of well trodden stable manure weighs 7,080 pounds; which is 940 pounds less than the weight of the same bulk of water. Dana in his Muck Manual says a cord of green cow-dung weighs 9,289 pounds, which is 1,269 pounds more than the weight of as much water, and is therefore clearly impossible, as there is nothing in cow-dung heavier than water. But this author is by no means free from erroneous statements. Waring is more correct and the weight given by him is the maximum for fresh and wet manure. 2, It is not advisable to sow clover in the way mentioned. It is not giving the clover a chance. It cannot become well rooted before the Winter, will be trodden and damaged in harvesting the corn, and the corn stubble will be greatly in the way of cutting the clover. It would be better to plow the corn stubble in the Spring, harrow it thoroughly and sow the clover alone. If this is done early and the soil is good a crop of hay may be taken the same season. 3. Yes. 4. Now.

Abortion in a Mare.

H. B., Beebe, White Co., Ark, wishing to obtain a colt from a valuable mare that is half gone with foal, asks for some means of preventing abortion. She is six years old and has already aborted once.

ANS.—When half the time of pregnancy is over, the mare should have special care as she is then more likely to slink her foal than at any other period. Good feeding, careful handling and moderate exercise are the best preventives of this mishap. The rapid growth of the fœtus at that time makes on her system a constant draft that should be met with an extra ration of grain. A mare that has once cast her foal is likely to do it again at a corresponding period of pregnancy—especially if a similar provocation occurs. Among the various causes of abortion are blows, strains, violent excitement of any sort, sympathy with other mares that have aborted in sight, and nervous spasms due to a diseased stomach. The sight and smell of food which the pregnant mare likes, but which she is not allowed to eat, will also be likely to cause her to slink her foal. If symptoms of slinking are discovered in time, it may be prevented by burning feathers—preferably those of a pigeon—in a pan of coals so that she will be forced to inhale the smoke. Once a tendency to abort has been established, however, it is not easy to counteract it.

Cut Corn-stalks.

N. A., Dillsburgh, Pa., asks, 1, whether it would pay to cut corn-stalks for stock feed, and whether horses and cattle would eat the cut fodder; 2, is there any nutriment in corn-stalks; 3, where can a good cutter be obtained.

ANS.—1. When corn fodder is cut fine or short, cattle and horses will eat it all up. There is not much nutriment in the woody part of the stalk, but it answers for bowel distension, which is important to keep animals healthy. A half-bushel of cut-up corn-stalks three times a day, with two quarts of meal added, will make a ration sufficient for a full-grown animal. The meal may consist of equal parts in bulk of bran and corn-meal, or cotton-seed meal. 2 Cattle would not thrive on the stalks alone, but with the leaves added they will do well if they have enough to eat; but it would be better economy to feed less of the stalks when fodder is high and add the meal or bran. 3 A good one is made by the Belcher & Taylor M'f'g Co., Chicopee Falls, Mass. Nearly all dealers in agricultural implements keep the cutter.

Plants "Damping Off."

H. M. D., Parkersburg, Ill., intending to raise early tomatoes, sowed the seed in several boxes in the house. The plants came up nicely, but before the leaves were fairly started they lost their bright green color and began to droop, and on pulling them up the roots were found all gone except the main one, which was girdled or stripped of its skin. Cabbage, onions, dianthus and snap-dragon suffered like the tomatoes, and we are asked what ailed them.

ANS.—The probable cause of failure is want of pricking off into other boxes, want of air, or too much moisture. The plants are not "girdled" by anything, but merely shriveled up—"damped off," as it is called. All seedlings raised artificially, whether in the house or in frames, are better pricked out before the third leaf is formed.

Miscellaneous.

C. H. H., Castile, N. Y., plowed an old pasture last year and planted potatoes and beans on it, tilling it well: this season he intends to use it for barley and seed down, and not having any barnyard manure for it, he asks for an analysis of barley, showing the amounts of potash, phosphoric acid and nitrogen it contains so as to be able to judge what sort of fertilizer should be used to supply it with plant-food and also he inquires what would be the best application.

ANS.—Per cent. of ash, 5.10; potash, 21.6; soda, 4 5; magnesia, 2 4; lime, 7 6; phosphoric acid, 4 3; sulphuric acid, 3 7; silica, 53 8. As you do not know which of the above constituents your soil needs or supplies in sufficient quantity or in excess, it would be impossible to ascertain what fertilizer would be best to purchase except by experiment. As a matter of guess-work, we should recommend unleached wood ashes or potash in some form.

W. S. G., Ackworth, N. H., asks, 1, what is the best work on orange culture; 2, where can he get a good-sized map of Florida.

ANS.—1, Orange Culture in Florida, a very useful little pamphlet, by J. H. Fowler, was published in 1873 at Jacksonville, Florida, and can doubtless be obtained through the Florida Agriculturist or the Semi Tropical, both of which are published in that town. The standard European works are *Traité du Genus Citrus* by Gallesio, published at Savona, Italy, in 1818, and *His oire Naturelle des Oranges*, by Risso and Poiteau, an elegant work with 100 beautifully colored engravings, originally issued at Paris in 1818, and lately republished under the editorship of the distinguished arboriculturist, Du Breuil. 2; From Colton, Zahn & Roberts, map dealers, 172 William St, this city.

W. H. S., Galveston, Texas, asks for some means of preventing a horse from chewing the lines or other objects close by while tied or standing.

ANS.—The only effectual way to obviate the above is to use a strong, light chain for the hitching strap, and also for any part of the lines the horse is in the habit of chewing. Some who use rope or leather straps and lines, rub them with aloes liquid, boneset, tansy or other bitter juice, or water in which they have been steeped. Such liquids, however, soon dry, and are only effectual for a short time. If the horse is in the habit of turning his head around to chew any part of his harness, or blanket, or fly-net, hitch him so short that he cannot get at them with his teeth.

B. F. W., Cambria, N. Y., asks, 1, where Norway Oats can be obtained; 2, are they the same as the Ennobled Oats; 3, what are the White Russian Oats, and are they all they are "cracked up" to be.

ANS.—1. We do not think the Norway is a distinct variety at all. It was introduced years ago, and, being of large size, sold at high prices. This size was owing, we believe, to high cultivation, selection of seed, and a favorable climate, and under ordinary treatment it is soon lost. We do not know of any Norway Oats now offered. 2 No. 3. Some highly praise the White Russian, some condemn them. We shall sow one bushel and tell our readers how they behave at the Rural Farm.

J. H. S., Logansport, Ind., sends an apple for name.

ANS.—The apple was sent to Mr. Charles Downing as we could not identify it. Here is his reply: "The apple came safely and I regret to say that I do not recognize the variety as any I am acquainted with. There are several kinds similar to this in appearance, and it is difficult, without having them together for comparison, to decide their identity. I think it is an old variety mostly gone out of use."

G. H., Hackettstown, N. J., asks whether mangels can be transplanted the same as beets.

ANS.—Oh, yes; but as Col. Curtis said in his article on mangel culture in last issue, it will not pay to transplant them, as the transplanted roots seldom pay for the bother. When it is done, the large leaves should be twisted off, otherwise the evaporation from them will kill the roots.

J. G., no address, asks where pipe and other necessaries for making a "driven well" can be obtained.

ANS.—Not having our inquirer's address we cannot mention the name of any dealer in his neighborhood; but the nearest plumber will be able to supply all requisites either from his stock on hand or by ordering what is wanted.

W. F. C., Mars Bluff, S. C., asks, 1, the name of the white bean commonly called the Navy Bean; 2, can it be planted in corn to advantage.

ANS.—1. It has no other name that we know of. 2. It is planted largely in the West with corn and yields well.

New Publications.

"FOR ORGANISTS."

ORGAN GEMS. ($2 50) By F. L. DAVENPORT.
ORGAN SELECTIONS. ($1 50) By PETERS.
BATISTE'S ORGAN VOLUNTARIES. $2.50.
BATISTE'S LAST COMPOSITIONS. $2 50.
ORGANIST'S RELIANCE. (10 Nos., each $1.25. Complete, $6.) By EUGENE THAYER.
ZUNDEL'S ORIGINAL ORGAN COMPOSITIONS. ($2 25.)

In these six well-made books will be found a very large number of voluntaries, some classical some new and light, but all good. Organists will be glad to use the longer ones intact, and to adopt the shorter compositions as themes from which to vary.

Billee Taylor, price reduced to 50 cents.
Olivette, price reduced to 50 cents.

Johnson's New Method for Harmony.

($1.00.) By A. N. JOHNSON. "The best book in the world" (for its object), was the commendation bestowed by an enthusiastic pupil on a former book by the same author. However that may be, this is his newest treatise and can hardly be excelled for plainness of explanation, ease and thoroughness. It does not attempt Counterpoint, or any of the higher problems of composition; but confines itself to those things that every organist, every good player, and every composer of "the people's music," ought to know.

CLOVER
To every farmer sending us his name, we will send free *The Clover Leaf*, a 4 page, 28 column farmers' paper, full of valuable information on the culture and harvesting of clover for seed. When you write say where you saw this notice. Address BIRDSELL MANUFACTURING CO., South Bend, Ind.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, APRIL 30, 1881.

SOME changes in our method of mailing having become necessary, subscribers would confer a favor if they would promptly notify us by postal card of the slightest irregularity in the receipt of the RURAL NEW-YORKER.

OUR Fourth Seed Distribution to the members of the Youth's Horticultural Club now numbering 1,000, is announced on page 298. As usual, no charge for postage is made and no application necessary. We trust our young friends may succeed well with the excellent kinds sent to them. The seeds of the Japan Judas Tree are very scarce and not offered for sale by anybody that we know of. Indeed, it rarely seeds in this climate. It is a grand shrub.

IN one of Dr. Lawes's experiments the produce of hay under a liberal supply of mineral fertilizers has been greatly increased. Though a large quantity of nitrogen has been removed, at the end of twenty-five years there is no evidence of a decline in the produce. The nitrogen of the surface soil shows "a considerable decline," otherwise, Dr. Lawe's says, "there is absolutely nothing to prove that the atmosphere has not been the source of the nitrogen removed in the produce."

WE are sorry to see it stated that eight and ten ears of corn grow upon Blount's Prolific Corn. Such statements work great harm. We have produced the largest well-authenticated crop of this variety on record, and we have yet to see a stalk with six perfect ears on it. The highest number of ears we have ever seen upon one stalk—and last season we examined *every* stalk in our field—was ten, six of which were nubbins. As a matter of fact, the average number of good ears to a stalk of Blount's Corn is a fraction less than three.

AMONG Summer vines we know of nothing more fragrant, more rapid in its growth, more glossy or luxuriant in foliage than the well-known Madeira or Mexican Vine — Boussingaultia baselloides—the tubers of which are offered by all seedsmen for five or ten cents apiece. The Chinese Yam—Dioscorea batatas—as a swift-growing Summer vine is also to be commended. It grows more rapidly than the Madeira Vine; its flowers are equally fragrant, but the joints are wide apart and the foliage scanty. The root, however, has the advantage over the tender Madeira Vine of being perfectly hardy. It may be left in the ground year after year. New tubers form and provide an unfailing and abundant growth of vine.

CATALPA SPECIOSA HARDIER THAN THE SPECIES.—We find that our specimens of Catalpa speciosa, or the Hardy Catalpa, as it is commonly called, have not been injured in the least by the past terrible Winter, while the species, Catalpa bignonioides, has been injured. The Speciosa trees are but two years from nursery plants a foot high. They grow with great rapidity and attain the size of from 12 to 20 feet, giving a dense shade and presenting a handsome appearance. The wood of this variety is now well known to be of great durability and, all things considered, we commend its use to our friends in general and to our Western friends in particular. Little trees may be purchased of leading nurserymen at a very low price.

TESTING OATS.—The field upon which last year we raised the large crop of Chester County Mammoth Corn, is now in oats of three varieties, viz., Russian White, Washington and English, the last weighing 50 pounds to the bushel and bearing no more specific name. We are now sowing in plots, varying from a half to one-fortieth of an acre, Mold's Ennobled Oats, imported seed, our own having become mixed; White Australian (54 pounds to the bushel!); Pringle's Excelsior-Hulless and about ten other kinds which have been commended highly as being "rust-proof," wonderfully prolific, or in some other respect specially worthy of cultivation. The season is such that we are quite ten days behind the usual time of sowing, for which reason, as well as from the fact that there is little time for thorough preparation of the soil, we do not anticipate very heavy yields.

IMMIGRATION.

STILL they come! On Tuesday last 6,881 immigrants landed at Castle Garden, and on Thursday 4,000 more disembarked. During the present month over 35,000 have arrived, and since January 1st over 80,000 have been added to our population—an increase of 20,000 over the arrivals for the same period last year. It is said that two-thirds of these immigrants go to develop the great West, and thus add much to the material wealth of the country. A fair estimate of the money value of an immigrant to a new agricultural country political economists place at $1,000, as the lowest figure, and this leaves out of consideration the money which the new settlers bring with them. In one week a single banking firm in this city paid out to immigrants brought over in three German steamers over $100,000 on bills of exchange. The Germans bring more money than any other nationality, and the Poles the least of all. An idea of the importance of these accessions may be formed when we remember that the 327,371 arrivals of last year, at only $1,000 a head, represented $327,371,000 added to the wealth of the country. According to careful estimates there will be not far from a half million souls added to our population by immigration this year. But the great question to be considered is, what will be the effect of the introduction of this vast foreign population, composed of different nationalities and coming from governments unlike our own, upon our social, political and moral status? This question will in the coming decade invite the closest attention of every one interested in the highest welfare of the country.

IMPROVED SEED-CORN.

AS THE time for planting corn draws near for the Middle and Northern States, we again urge it upon our readers to plant a small plot as far away from other corn as practicable. Let this plot be prepared as if it were a garden and let it be 33 feet square, or one-fortieth of an acre, which will be large enough to furnish seed sufficient to plant from six to eight acres next year. Let the rows be fully four feet apart, and drop a single kernel every six inches so as to insure a full stand. Then at the first cultivation cut out the plants so as to leave them from one foot to 18 inches apart in the row. As soon as the sets appear, and just before the pollen of the tassel is ready to fall, cut off the tassel from every stalk that does not show two or more sets according to the habit of the variety. If, for instance, it were Black Sugar Corn, we should leave the tassels upon only such stalks as had developed three sets or more; if Blount's, six to eight and so on. As, however, sets very often, instead of forming ears, change to lateral stalks or remain undeveloped, it is safest to mark the most prolific stalks before harvest and then select the best ears thereon for seed. This plan is attended with some trouble, to be sure. But we feel confident that those who follow it for two or three years will be well repaid for their pains by an increased yield of a better quality of corn.

We have seen the thoughtless and quite impracticable method advocated of going over an entire field in this way and emasculating the less productive stalks. Why do this when a small plot, with comparatively little labor and expense, may produce all the seed corn needed for another year, and that too which has had every advantage in the way of improvement that could have been given in large fields with forty times a greater amount of tedious labor? The sets in many cases, are by no means easily discovered at that time when the pollen is nearly ripe enough to be shed, and we don't believe there is one farmer in five hundred that could be brought to examine a ten-acre field in this manner.

A NEW MEANS OF PURIFICATION.

THE idea has hitherto prevailed quite generally that for purposes of disinfection we should seek to prevent, in so far as may be possible, any fermentation or putrefaction in accumulations of filth. To this end a great variety of powerful chemical agents have been resorted to, such as copperas, chloride of lime, permanganate of potash, carbolic and sulphurous acids, and so forth, which act by destroying the bacteria or other organisms which cause decay. Professor Alexander Mueller, of Berlin, has now proposed an entirely different method of procedure. He has recently patented a process for purifying drain-water which consists in systematically cultivating therein various yeast-like organisms, which feed upon the matters that would become offensive or dangerous if left to themselves. So far from using those kinds of chemicals which work to destroy the lower organisms, he adds to the drain-water such materials as may be needed to supplement the matters already contained in it, so that there may be a complete supply of food for the organisms he wishes to have grow. The liquid has to be neutralized also, and pains are taken to maintain it at an appropriate temperature; that is to say, to prevent it from becoming chilled. The idea is, of course, to foster and, as it were, cultivate the organisms to the utmost. Thus far it has not been found necessary to make any direct addition or "seeding" of the organism to the drain-water, since there are plenty of germs in the air which will develop of themselves in the liquid, provided it is in fit condition. The gases generated during the process are made to pass into a system of drain tiles buried in the earth, which absorbs them. A quantity of harmless mud, valuable for compost, settles out from the liquid, while the water itself becomes so pure that it might be used for almost any domestic or manufacturing purpose. The process is specially adapted for purifying the drain-water from beet-sugar factories, but is manifestly applicable to other cases where no very large amount of liquid has to be dealt with, and may perhaps be found applicable even to the sewage of cities.

AN APOSTLE AND HIS PROOFS.

M. LEON COTTEAU, the irrepressible Gallic apostle of Free Trade, whose arduous mission is the conversion of selfish America to the generous faith that to buy from our neighbors is to enrich ourselves, arrived at this port on the 21st instant for a third proselyting tour. His former missionary efforts were weakened by the objection from his infidel opponents that, with unapostolic selfishness, he had only the interests of his own fatherland at heart, since, in return for the privilege of injuring the producers and manufacturers of this high-priced-labor country by the free competition at their own thresholds sought for between their goods and the wines and wares of that low-priced-labor land, no equivalent was given, owing to the comparatively small amount of French importations of American products. The reciprocity of benefits on which the doctrine of Free Trade is founded, was all—well, nearly all—on one side, it was insisted, in this case. While indignantly denying the charge, the wide-awake missionary evidently felt its full force, for even before landing the other day his first words to a newspaper interviewer exultantly announced that he had succeeded in forming in Paris one company, with a capital of twenty million francs, for the importation of American live stock, and another, with an unmentioned capital, for the importation of all sorts of American products. Our wild exultation as farmers and Americans at these twin proofs of French mercantile enterprise is restrained only until time shall have told, first, what proportion of the millions of the first company will ever be called in; second, how much of the capital of the second, also, will ever be used; third, will either ever be different from the many other speculative European organizations projected within the last few years for trading with this continent, all of which went "sky-high" before rising to the dignity of usefulness; and, fourth, in the event of either of the companies ever enlarging the market for our products in France, will not the Government curtail it on some pretext as frivolous as that lately hit upon for embargoing our pork, hams and sausages? When time shall have dispelled our doubts on these points in accordance with our wishes, we shall exult in the establishment of these twin companies, not only as proofs of French enterprise, but also as specimens of the possible advantages of Free Trade.

BREVITIES.

FROM our Everywhere correspondence it will be seen that Eucalyptus globulus trees "nearly thirty feet high" have been killed in Florida the past Winter.

WE propose to offer a handsome prize for the best bunches of Argenteuil and Giant Dutch Asparagus raised from the seeds sent to subscribers by this journal—the second year.

IS THERE any other article of human food as nearly tasteless as potatoes of the Early Rose type? We want a variety of the Peachblow flavor, as early as the Early Rose or Beauty of Hebron, and as productive as the latter.

GENERAL LE DUC has sent us a quantity of the seeds of the great insect destroyer—Pyrethrum roseum, the flowers of which are ground into powder and called Persian Insect Powder and many other names. These seeds, put up in little packages, we shall send to our readers as far as they go.

WE hope that all of our readers who have no grape-vines will plant at least one this Spring. Make the soil mellow and fairly rich. Press fine soil over the roots, which should be carefully spread out as if upon an inclined plane, and not planted directly downwards. Permit two or three buds to push and then remove all but one—the strongest.

DR. LAWES of Rothamsted, England, in a private letter to the RURAL, states under date of April 11: "We have had a month without rain, which has been of the greatest possible benefit to us and all our Spring crops are well got in. After six very wet seasons in succession, we may expect some dry ones, but they will come too late for many of our farmers."

WE wonder who it was in Washington that informed "George Thumber, Ed., etc.," that O. Judd would probably be appointed Com. of Agriculture if it could be made to appear that a considerable number of farmers desired it. Evidently they were fooling the good Doctor. It would not be right that any agricultural editor, even though he were a capable, upright man, should fill that position.

ALTHOUGH we object to the present form of the bill before the New York Legislature relating to oleomargarine and kindred concoctions, still we urge our readers in this State to forward petitions in its favor at once to the Representatives and Senators from their respective districts. Our objections to it rest mainly on the belief that what legislation it seeks is both so harsh that even if secured it will be practically inoperative, and of such a special character that the Supreme Court, when appealed to, is likely to declare some of its provisions unconstitutional. The bill can be properly amended, however, before the Legislature, either in the House or the Senate, and it is to be hoped there are in both bodies a sufficient number of friends of the measure to see that it is put in proper shape. Moreover, the dairy interests of the country, the health of the public, and honest dealing, urgently demand legislative protection, and we are not so impractical as to reject all legislation except the best.

IN the good old times, the merry times, the innocent, unsophisticated, reverential, religious times of our forefathers, the life-time of a generation was thought not to exceed 33 years. This was before scientific progress, deterioration in morals, keen competition and eagerness for speedy enrichment poisoned with adulterations the food, the drink, and even the clothing of the people; before gaslight and its attractions kept the city-man and social parties, grange meetings, etc., with their mild dissipations, the countryman out of bed at unseasonable hours; before the increased wickedness of these latter days, about which we hear so much from the pulpit, the press and the chimney corner, sapped the health of the young and shortened the life of the old; before the turmoil and goaheadativeness of to-day shattered the nerves of the people, and the railroad, the steamboat, the reaper, the thrashing machine and the exploding boiler mangled their bodies. Yes, before all these and a multitude of other causes of early death vexed the world, the life of a generation was 33 years—vital statistics now put it at about 43.

A VALUABLE SHIPMENT OF LIVE STOCK.—A couple of weeks ago one of the most valuable consignments of pedigree stock ever exported from Great Britain was shipped at Liverpool on the Dominion Line steamer Texas. It comprised of Short-horns two Bates heifers and four valuable cows; of Jerseys and Guernseys, a number of bulls and heifers carefully selected in the Channel Islands; of Herefords, a bull from the royal farm at Windsor and upwards of sixty other higher-priced bulls from different parts of the country; of Polled Angus cattled, forty-five bulls and cows purchased in Aberdeenshire. There was also a very choice selection of Shropshire Down sheep from Lord Strathmore's flock and 200 Shropshire and Oxford Down sheep from other noted breeders, as well as two costly Clydesdale stallions from Dumfries-shire. These were all shipped by Hon. M. H. Cochrane, of Hillhurst, Canada. On the same steamer were also three prize Guernsey heifers, a choice lot of Shropshire Down sheep and ten valuable Clydesdale stallions for a couple of other Canadians. The value of the whole shipment was put at $150,000 in England. It would be interesting to know what their price would be on this side of the Atlantic.

THE agricultural evils of the vast military system of Europe are best illustrated in small States. At present Greece, which for some time back has had from 40,000 to 80,000 soldiers under arms, is grievously suffering agriculturally from this burden. Repeated levies have drained the rural districts and especially the islands, of nearly all their able-bodied laborers. The olive crop is the chief source of wealth to Corfu, and last year it was exceptionally abundant, but from sheer lack of hands to harvest the fruit it lay rotting on the ground. Eager women and children could not supply the want of men. Land-owners who are rich enough are sending this year to Italy for laborers, but the poorer farmers are in a wretched plight. Every belligerent news from Athens spreads consternation through the agricultural districts on the mainland and islands. Had our late "onpleasantness" resulted in the rupture of this country into two sections, the evil would not have stopped there, for it is not improbable that the country would have soon become divided into a number of petty States each without weight or respect abroad and armed to the teeth at home, just as Europe is now. In view, therefore, of the evils of militarism across the Atlantic, even the unsuccessful in the late quarrel must regard their failure as "a blessing in disguise."

Miscellaneous.

THE TRUTH ABOUT IT.

[THE object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

TRICHINA IN PORK.

A VAST amount of error and nonsense has been spread abroad of late in regard to a parasitic disease in pigs known as the spiral flesh-worm, *trichina spiralis*. The whole pork-eating world are in arms and dread to touch their favorite meat on account of the danger of infection from this parasite. The most foolish and surprising reports are made in respectable journals, by which the public who take their information at second hand are deceived and alarmed. Perhaps those enterprising persons who are known as the great pork speculators, who get up corners, and who, by false reports and doubtful schemes, gain the control of the whole pork product of the country, may have "a finger in this pie" in the effort to pull out a plum from it. Nevertheless there is a popular excitement altogether undue in its extent and wholly exaggerated in its character, which should be allayed by the very simple remedy of telling "the truth about it." Now the truth about this disagreeable little spiral flesh-worm is as follows:—It has been known for a number of years, but it is within 20 years that its deadly character in the human system has become notorious. In 1871 a large number of persons died in Cumberland, England—a famous bacon and ham district—from the disease, brought on by eating raw ham. Both before and since then it has occasionally appeared in localities where raw pork and sausages are habitually eaten.

The natural history of this pest is very simple and when known should both remove all misapprehension as to its character and suggest such effective precautions as would totally remove all danger from it. The prevailing ignorance in regard to it among educated people is surprising, and it shows how recklessly some writers for newspapers, who call themselves "journalists," make statements that are utterly unwarranted. For instance, a "special dispatch" from Boston is given in a leading Chicago paper, purporting to be copied from a Boston commercial journal, in which it is stated that an outbreak of trichinosis has occurred in Massachusetts, *but it is not expected to become epidemic*. The person who could write such a paragraph must be very ignorant of the subject, and none but a reckless person could so mistake, or so assert, without at least looking into the nature of what he is writing about. Such loose, ignorant statements do much to harm and greatly disturb and harrass people who cannot know any better.

Trichina spiralis is a minute worm which has an active and a dormant stage of existence; it is from one-sixth to one-twentieth of an inch in length and when encysted can be seen by the naked eye, and easily with the help of a small magnifying glass. It infests the muscles of mankind, the hog, dog, cat, rat, mouse, chicken, owl, hawk, and even the goat and rabbit; but it is always introduced through the stomach in food or something that is eaten. In the human body it can only enter with infested food; in other animals it may be taken in with the dung which is picked up eagerly by fowls, dogs, and hogs, or in the prey caught by cats, owls, etc. The larvæ or the mature and fertile worms may be swallowed in dung and the larvæ in their dormant and encysted state, in flesh. The worm matures in the intestines, and in seven days after it becomes fully grown, it produces a numerous progeny of very small hair-like larvæ and then dies. The larvæ at once pierce the walls of the intestines and penetrate the muscles all over the body. It is during this journey that the fatal effects, are produced. The irritation caused by the passage of myriads of these worms through the walls of the intestines and the peritoneum (the abdominal lining membrane) produces all the symptoms of intestinal or typhoid fever, or diarrhea and other complaints of the bowels, and their migration through the muscles causes severe pains, stiffness, and cramps in the limbs, which are similar to those belonging to rheumatism. These painful symptoms last from four to six weeks unless death sooner intervenes, and the recovery is slow and tedious. As soon as the worms become settled they are surrounded and enclosed in an oval or lemon-shaped cyst, and remain dormant, giving no further trouble for years, until by some occurrence the worms enter the stomach of some living animal when the cyst is dissolved, and in two days the worm becomes active, and fertile, and the same round is repeated with its progeny. It is said that the lower animals do not suffer in this way from the presence of the migrating worms, but this is scarcely reasonable and there is every probability that many of the obscure diseases which afflict these animals, such as intestinal fever, paralysis, stiffness of the limbs, and rheumatism in swine and poultry may be thus caused.

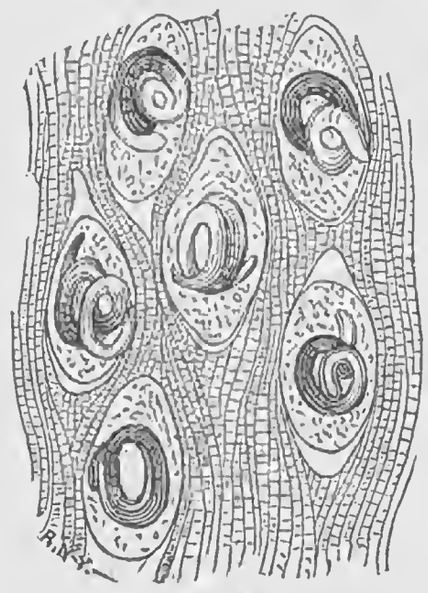

FIG. 228.

When the worms become encysted they appear as small, white oval grains imbedded in the muscles. They are never found in the fat, and this utterly disproves the absurd reports that they have been found in lard and other fat products. When very numerous, a ham or other flesh cut across may appear pale in color, and by close examination the white cysts may be seen by the naked eye. In cutting slices of muscles for microscopical examination with a fine blade, the gritty feeling may sometimes indicate the presence of the parasite. At Fig. 228 is shown the appearance of these cysts with the inclosed worms in muscular fiber magnified. At A, Fig 229 is shown a piece of pork infested with measles, a larval form of a tape-worm, *tænia solium*; the cyst with the inclosed worm being shown at C, Fig. 229, and the head of the worm at B, Fig. 229. From the marked similarity between the measle in its encysted form, as here shown, it can be readily seen that measles can be easily mistaken for trichinæ, and possibly sometimes are. But in truth there may not be much to choose between these two creatures, both sufficiently disagreeable; the tape-worm, however, remains in the intestines, and one may become

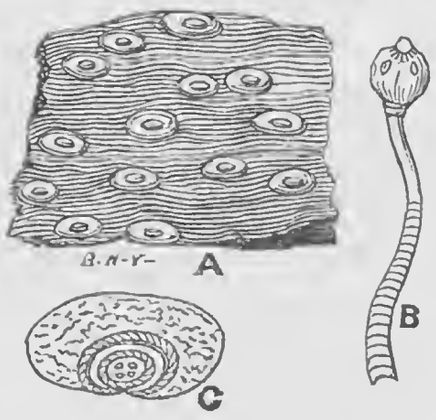

FIG. 229.

the unsuspecting host of a lively tape-worm without feeling much trouble, and be secure from any fatal results from it, while the trichinæ produce serious and frequently fatal disorders. All these pests, trichinæ included, are killed by exposure to a boiling heat; and thorough cooking is a perfect safeguard against them. Cleanly-fed animals are never subject to them. Where mice and rats abound, and where animals are suffered to consume the dung of others that are infested, or where dead animals are left to be devoured, this and other similar parasites may abound. It is thus seen that to consider this disease as liable to become epidemic is utterly unwarranted; also that it may be guarded against by the cleanly keeping of our pigs, fowls and dogs, and the abolition of mice and rats from the premises; and, lastly, if people will refrain from the savage and uncivilized habit of eating raw meat, whether it be salted or smoked (for these modes of preparation are futile against the danger), and will take care to cook their flesh meat thoroughly, all the danger may be averted. Another truth of this matter is that the present excitement is an instance of the spasmodic appearance of those popular delusions and apprehensions which are founded on *facts* drawn chiefly from the imagination of sensational writers for the public press. H. S.

POCKET SILOS.—There is no use in letting the rich farmers have all the silos, we poor ones ought to have a small chance according to our means. Let us all go to the boiler-makers and get sections of old boilers, fitted with a permanent bottom at one end, and a snap cover on the other; then let the rich philo silo-phers, with their steam power presses, cram our little silos full of greens or cow-crout, or whatever the right name is, and we will call for our little kettles and lug them home to our cows in our pockets, if our pockets are big enough, and if they ain't, why, we won't meddle with them, and all other men with big heads and little pockets will do likewisely. S. R. M.

Literary Miscellany.

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

(Continued from page 278.)

CHAPTER XIV.

FIRST IMPRESSIONS OF THE COUNTRY.

WE had now arrived within a couple of miles of the city's boundaries, which fact was made known to me by Mr. Glinden, in answer to my inquiry concerning some objects which appeared to be moving about in the air at quite a distance from us. As we approached, these objects seemed to increase in number, and their movements became more complicated. Now one, appearing a mere speck in the distance, would gradually grow on our sight till my eyes, strained in the effort to discern its form and appearance, would find relief in its suddenly dropping from sight. Another would rise on my view, and gradually appear to diminish in size till it was completely lost to sight. There were others crossing and recrossing the tracks of these at all angles, and it certainly appeared to me that their movements were carried on at the imminent risk of collision. I could compare them to nothing else but the boats and ships in the harbor of some great city. In fact they were air-ships plying between the city and all parts of the country. It was necessary for them to have their stations on the outskirts of the city so that they might have plenty of room to make their ascents and descents in windy weather. Travel across the country was carried on almost exclusively by these air-ships which had arrived at such a marvelous degree of perfection both in their construction and management, that trips were made in them with absolute safety, and with much less hindrance from the winds and currents of the air than the ships of our day receive from the storms of the ocean. While the speed with which they traveled under favorable circumstances rivaled the flight of the swiftest bird.

It was certainly very awe-inspiring to me to look directly up at these great objects moving above me with so much gracefulness and majesty of movement. And when I reflected that from twenty to one hundred and fifty human beings were suspended in each of these great air-ships, my blood ran cold at the thought of the many frightful catastrophies which must happen among a great people whose chief means of travel is through the air. But Mr. Glinden informed me that there were so many safe-guards placed about these air-ships, and that they were built with so much care and skill, and were managed by men who were born to the occupation, and trained to it most carefully, that he had never known of a single accident which had been attended with loss of life.

They were constructed on the principle of phillego-motera, but beside the great disc which was much larger in them, they had sails which enabled them to utilize the wind, and a most ingenious apparatus for guiding their course, which was capable of being used almost as skillfully as a bird uses its tail for the same purpose. It was most marvelous to see how quickly the speed of these ships could be checked, and a descent effected when a station had been reached. Even if there was a considerable wind blowing, the skill of the æronaut enabled him to guage its force and his distance so nicely that he would bring his ship to its destination as accurately as the eagle swoops upon its prey.

I was surprised to find that the boundary of the city was as clearly defined as any street within it. The outside wards were made up as regularly of their hundred and forty-four squares about their parks as any ward in the heart of the city, while the streets which ran around the outside of these squares presented the peculiar appearance of fields of grain and other growing crops on the one side and closely built up houses on the other.

Our passage from the city into the country was therefore as abrupt as could well be imagined, and I must own that the scenes which now burst upon my sight, if they were less wonderful and magnificent, were no less interesting and pleasure-giving than those with which I had been so wonderfully entertained in the city.

As an appearance of thrift, wealth and refinement characterized everything about the city, so in the country there was nothing common or slipshod about the farmers or their homes. Everything spoke of the accumulated culture and prosperity of many generations of prudent, far-sighted and unstinted industry. The roads were wide and paved like the streets of the city, and on either side of them was a row of grand old elms, whose far-reaching boughs, the growth of many centuries, formed a complete canopy above them. There was also a well-paved sidewalk on either side of the road between the rows of trees and the lands of the farmers. No fences protected the crops from the animals which might pass along the road, nor were there any boundary fences between the lands of the different farmers. In fact, the only fences which I saw were those about the farm-yards where the cattle were confined.

I wondered at this, and also that the houses of the inhabitants were built in close proximity to one another so as to form a most attractive village. I observed that these villages occurred at regular intervals, and that they were invariably built at the intersection of two highways, which also invariably crossed each other at right angles.

I finally asked Mr. Glinden how it was that the country roads were laid out with the same regularity as the streets of the city, and why the people built their homes together at the intersections of these roads instead of singly, on their respective farms.

"The answers to these questions," he replied, "may be found in the methodical and social characteristics of our people. As our cities are divided into wards of a uniform size, so the cultivated lands of the country are divided into sections of about a mile square. Twenty-five families occupy each section, which they own and cultivate in common, and the proceeds of their labor is divided equally among them.

"The villages are composed of the families of four adjoining sections, and they are built at their contiguous corners so that the families of each section may occupy their own land and still enjoy the advantages of the larger society which this arrangement gives. Each village has its church, its gymnasium, its school and its library, as well as its embowered pavilion, where the people may meet in the evening for social pastime and enjoyment.

"Moreover, each section is associated with a ward of the city and finds a ready market for its productions in its own ward, and each ward receives an abundant supply of country produce from its own section."

"This is doing business on the co-operative and mutual benefit plan on a large scale, surely," I remarked. "But do you mean to say that every ward in the city has its particular farm in the country, so to speak?"

"Yes, sir, about every city there are as many sections of good arable land as there are wards in the city, and each ward is the market for a particular section. The farmers of each section, of course, are careful to put in such crops and such quantities of them as the demands of their market require, and by long practice they have learned to regulate this matter so that supply and demand are always equal. The farmer thus disposes of his crop without trouble or anxiety, and without even the necessity of accompanying it to market. In fact, the occupation of the farmer, which was formerly one of toil, uncertainty and anxiety, has lost these characteristics as completely as any occupation which our people follow. Our farmers have learned the art of keeping their land in the very highest condition of tilth, and the uniformity of our seasons in conjunction with this, insures a uniformity of production; and, consumption and value remaining ever the same, he knows before he sows his seed just what will be the income from his labor."

CHAPTER XV.

FARMING AS AN ART.

WE now approached the residence of Mr. Glinden's friend, and as we drew up in front of it, an old man who had been sitting on the spacious veranda came down to greet us.

"What, Elijah!" he exclaimed, "is that you? Joy and happiness be with you! I am glad to see you."

This was the common mode of salutation in this country instead of "How do you do? I hope you are well," etc., as with us.

Then peering very sharply at me the old man inquired, "Is this Helpo that you have brought with you?"

Helpo, I may explain, was a favorite monkey of Mr. Glinden's. It is also due to the old gentleman to say that he was well stricken in years, and that his sight was quite dim. And of Helpo it may be said that he was a very remarkable specimen of his species possessing the gravity, wisdom and physical perfection of many generations of progressive development.

When Mr. Glinden explained to the old man that I was a stranger from afar-off, and hitherto unknown country, he was equally surprised and abashed. He apologized for the error into which he had fallen by assuring me that when I had lived in the world a hundred and fifty-seven years, as he had done, it would not be strange if I sometimes mistook an inferior man for a superior monkey.

Here again I may explain that this people are so honest in thought, word, and deed, that they often discover the greatest simplicity in speaking what is in their minds. It was not the first time that I had been cut by such a remark as the foregoing, spoken without the least intention of giving pain, but with the artlessness of a mind which was incapable of concealment or deception.

The old man led the way into the house, which, by the way, was constructed on the same plan as the residences of the city. In fact, all the houses in the country were built of the same material as those of the city, and with no less skill and elegance in every detail of their construction.

We were cordially received by an elderly lady. I would call her old, had not our aged friend, Mr. Lenor introduced her as his daughter. She was in reality the wife of his son, and though as lively as a cricket, she had seen at least, a hundred and twenty summers.

Mrs. Lenor told us that all the other members of the family were out in the harvest field, and, knowing that she was fully occupied with household duties, Mr. Glinden proposed that we should go out and watch the operations of the men and women, I may add, in the field.

We could see them from the house scattered over the far side of the sections a small army of at least a hundred men and seventy-five women, mowing and reaping and gathering into the great stone barns, the grass and grain at it was cut. There were no horses connected with these labors, their places being fully occupied by the wonderful phillego. The phillego-engines were quite small and light as compared with our steam engines, and remarkably manageable in the hands of a skillful driver. Among the farmers this duty was accorded through courtesy to the women, as being less laborious than any other. My training led me to remark to Mr. Glinden that it would be an evidence of a truer courtesy on the part of the men, if they would take upon themselves the extra labor which the women performed, that they might be permitted to pursue duties which were more delicate and congenial where they would not be oppressed with the burden and heat of the day.

He looked at me in a reflective manner, as if he

were endeavoring to recall a scrap of almost forgotten history.

"I believe in the olden time, sir," said he, "that he people held peculiar ideas in regard to the sphere of woman. There were so many things which were deemed *unwomanly* which were not thought *unmanly* that the sphere of her efforts was narrowed down to a very circumscribed circle indeed. Guided by a more thorough knowledge of the laws which govern our physical and mental natures, we give to her sphere a much wider latitude. We say, that having a body which requires fresh air, sunlight and exercise no less than man's, and mental faculties which require a field of self-reliant and independent effort for their full development, the sphere of woman should be as broad as the demands of society require to make her life the most useful, and to secure the highest and best development of her physical and mental natures.

"Now, if the old, weak notions of woman's sphere prevailed among us, our women would be languid, inert creatures from mere lack of employment which would give energy to their physical natures. While our men would be oppressed with a superabundance of labor, which would weaken instead of giving tone and vigor to their bodies. The good sense of our women, therefore, and their fidelity to that popular principle among us which teaches us to bear one another's burdens prompts them to make themselve as useful as they can in any sphere where their own well being, as well as that of society, may be promoted.

"You must remember that our women are not the frail, delicate creatures of the olden time, but of perfect health and vigor, so that what would be laborious work to the women of old is little more than recreation to them. Beside, the perfection of our machinery has taken away heavy labor from the farmer's life, and made him a man of skill, instead of, as formerly, one of toil. And, like his fellow-countrymen of the city, his labor ends at noon.

"There is an illustration of the remark which I have just made," continued Mr. Glinden, as we now approached a field of grain which was being reaped by a phillego-reaper and binder, upon which sat a young woman, like a perfect Hebe, giving the directing power to the machine. It cut a swath of twelve feet; the grain as it was cut being received by three pairs of arms, in which it was securely bound and which threw it back upon an elevator that carried it still farther back to a phillego-motor wagon, where two men were stationed to receive and place the sheaves. When this wagon was full—its capacity was about six tons—it was moved off to the barn and another took its place. Thus while one wagon was being unloaded another was being filled, and the work of reaping went on continuously.

To be continued.

NEW PUBLICATIONS.

Testimony of the Ages, by REV. H. W. MORRIS D. D., (Formerly Professor of Mathematics in Newington College,) J. C. McCurdy & Co., Philadelphia, Pa.

This work is the result of many years of patient toil. It is a monument of learning and research, and it will take a leading position as a book on the Authenticity of the Old Testament and the Evidences of Christianity; the author is to be congratulated upon its completion. A valuable feature of this work may be found in the large number of fine engravings, on wood and steel, which not only adorn its pages, but also illustrate, explain and enforce the text. Many beautiful views are given of the cities and towns in which the Savior lived or which He visited in the course of His active ministry on earth. Bethlehem, and Nazareth, and Bethany; Cana, and Capernaum, and other cities and villages in which His "many mighty works" were done, are shown in all the rugged strength or quiet beauty of their various outlines and positions. Here are produced the testimonies of Geology and Astronomy to the Bible account of the origin and order of the work of creation, and the extent of the universe. Geography, Natural History, Physiology, &c.; the bondage and deliverance of the Hebrews; the recent scientific survey and explorations of the Wilderness of Sinai, and the whole land of Palestine are but a few of the many subjects that are enlarged upon. The Scripture student will, no doubt, find interest and profit within its folds. Its variedness gives it a power over similar but less attractive productions.

"Handy Book of Synonyms." Philadelphia. J. B. Lippincott & Co. Price 75 cents.

This little book is well worth its cost to any engaged in literary work. There is no excuse for a displeasing repetition of words with this at hand, and every writer and speaker will find it useful.

MAGAZINES FOR APRIL.

NORTH AMERICAN REVIEW.—Contents: Reform vs. Reformation; The Thing that Might Be; Religion in Schools; The Ownership of Railroad Property; The Historic Genesis of Protestantism; The Telegraph Monopoly; Henry Wadsworth Longfellow.

THE THING THAT MIGHT BE.—The tendency to go about showing other people what might be is widely enough shown by nature. But the mere tendency which exists in us all when young is unequally developed in later life, as individuals vary in observation of what is, power of imagining what might be, and energy of will urging them to replace what is by what might be. As we advance in life, many things occur to check the growth, or kill the germ of this tendency. The two main counteracting forces are: (1) The enlargement of our own knowledge, which discovers to us reasons why things are not better done than they are, which reasons had been before beyond our vision. (2) The discovery that the trade of general improver is one that is apt to make us very odious to our fellows, and that, even if we can show demonstratively that something better could be put in the place of something that is, we had better not say so.

Thus it comes to pass that every ingenuous and intelligent youth is sent into the world by nature with the initial promptings of enterprise and innovation, and that the same youth, by a process equally natural, is found in middle age a stout, conservative and sturdy champion of the thing that is. Thus there goes on in the social laboratory a constant manufacture of a generation of conservatives out of a generation of liberals; and by this thesis and antithesis of nature the equilibrium of a political community is maintained.—Mark Pattison in North American Review.

Scribner's Magazine; The Ladies' Floral Cabinet; Domestic Monthly; St. Nicholas; Godey's Lady's Book. Want of space allows but brief comment of receipt and usual standard of excellence of the above magazines.

International Exhibition.

A dispatch from Melbourne, Australia, states that the "*First Award of Merit*" was given to the "Davis Vertical Feed Sewing Machine," which is manufactured at Watertown, New York. A great effort was made on the part of the old-style under-feed machines to capture the prize, on account of the "Davis" having received the First Award at Sidney in 1880, but, as it appears, without avail. It is now generally conceded that the Davis has no equal in excellence of construction, great range of work, and ease of operation.

For Women.

CONDUCTED BY MISS RAY CLARK.

MADGE'S TEN POSTAL CARDS.

IT was rather trying to Madge to be laid up with a cold on a rainy day when she had planned such a splendid shopping day in the city with Carrie Lee.

"But the money will keep," she concluded philosophically, "and dry-good stores will not be quite sold out, probably, when I reach there. I wonder what I can do to amuse myself." She turned towards her open writing desk, which was always invitingly handy, and took up a new package of ten postal cards.

"I will just send off every one of these cards," she thought, "just for the fun of it, and write them just as fine and as full as I can. I will make folks put on their specs to read them," and laughing as she seated herself and dipped her dainty gold pen in the ink.

Madge always set about a thing at once when she had decided upon it.

"Poor Alice away in that Dakotah land, with a sick family to care for! I know it will give her memory a pleasant jog even to get a full postal from the old home-land." So she wrote her at least a dozen items of news on the small surface and set it up, after directing, on the edge of her book-case to dry off. The next was to a distant cousin, and it was easy to put in home news enough to fill it; just such chat as two girls would be likely to indulge in, if they met for a few minutes in any public place. Nothing important or very private, but quite interesting to hear, to one far away. The old associations it would bring up would linger pleasantly about the heart for days.

Madge had friends enough for the whole ten, and now she had got so fairly waked up to the subject of correspondence, she rather wished she had another package to begin on. The business had given her a pleasant morning's occupation, and as the cards went their several ways they did good like a medicine in a good many homes.

These little news items were talked over and commented on and better still, thought over until everything seemed brighter for this ray of sunshine coming in. Old friendships were cemented by this small outlay of time and postage and hearts were cheered. That rainy morning was a good thing after all.

How many who have not time to write a little could send a postal full of information and not leave absent ones to feel themselves coldly neglected. It would teach young people conciseness in expressing their views and discrimination in selecting the most important points. Like a deaf man who was always well informed on leading topics mainly gathered from conversation, who explained the matter by saying, "People do not talk nonsense to a man through a speaking trumpet," postal card correspondence generally has the merit of being sensible. AUNT EVA.

BEAUTY.

WHAT a wonderful gift beauty is! and what woman is there in the world who would not gladly see herself possessed of it? Of course, we all remember how our elder "sisters and our cousins and our aunts" used to check the stirrings of childish vanity, or endeavor to do so, by telling us that "beauty is but skin deep," "handsome is that handsome does" and so forth, and we may have come to understand the wise man's aphorism that "beauty is vain"; but still there is not one who would not be pretty if she could. Unfortunately, however, it is impossible, and there are noses, and mouths, and complexions, and even eyes that by no stretch of imagination or affection can be deemed lovely; and yet there are few who do not possess some feature or expression which redeems them from absolute ugliness. But though we cannot all have pretensions to beauty, every woman who will may be charming, and to be so is really part of her mission. Every one can cultivate the sweet tempers and obliging dispositions that mould our faces as well as our fates, and we can all keep ourselves sweet and clean, and to a great extent healthy. Health is a beauty in itself, and nothing conduces to it more than plenty of fresh air and pure water, a contented and cultured mind, and plenty of occupation.

Art and experience have taught civilized people a good many little "wrinkles" by which they can improve their personal appearance and keep themselves in decorative repair, even when youth has vanished, and there can be no reason why these should not be remembered and acted upon. They need not add much to the time spent upon our toilet, for if we only know what to use and how to do it, habits are formed in a manner which soon become second nature, and we make the best of our advantage and keep ourselves nice and attractive without bestowing much thought on the process.—*Correspondent.*

MODEL CHILDREN.

NOT very long ago an article appeared in the RURAL describing an only child who with extra care and painstaking had so far proved to be healthy and good tempered, what we should call "promising." That is all very well and every mother's experience is interesting to other parents but one thing was strongly brought before my mind by the article in question.

All children cannot be only ones, and, have the sole and undivided attention of their parents, neither is it desirable that they should because experience shows that children flourish best with a little wholesome neglect, that is, it need not be a life study as to what agrees with them, and what does not.

American children are more numerous among the middle classes, and the finest specimens of men and women to be found have come from large families. Children in such places are obliged to surrender their own wills now and then, and learn to "give and take" a habit much easier learned gradually in childhood than in maturer years. In large families of limited means there cannot be such particular attention paid to the diet of each child and other matters are only in a general way looked after, and yet with sensible parents how they thrive. Self reliance comes easily and naturally where a child is "turned off."

I have in mind a boy of nine years who ranks as number six in the family who was no trouble to raise, always good humored, healthy and happy who always ate whatever he relished from the variety of a farmers table without any fixed rules for diet, or over carefulness of exposure to the weather; whose tastes are pure and simple and whose hearty boyish enjoyment of life, study or play, it is a comfort to contemplate.

Such children are born, they are not made what they are by careful diet nor watchfulness; they are heaven's best gifts and human wisdom may not claim the work. B. C. D.

LITTLE HELPS.

MRS. J. E. S.

How to obtain perforated patterns for embroidering:—Take a figure in cretonne, one from wall-paper, or any you may chance to have, and to the back of it baste smoothly a white or light-colored paper. Throw the thread from off your sewing machine, and place your pattern ready for stitching, with the figure uppermost. Run the machine, stitching a perfect outline of the figure; remove it, and you will have a perforated pattern for stamping.

The powder can be made by mixing some finely-powdered gum-arabic with chrome blue for white or light-colored goods, and starch with the gum for dark ones.

To stamp, secure the perforated pattern exactly as you wish it to be on the goods, with a small brush or soft piece of white linen rub lightly a very little powder along the perforations; then remove the pattern and press with a warm flat-iron, thus melting the gum and making the powder adhere to the cloth, which keeps the pattern legible. Be exceedingly careful not to use too much powder.

With a little experience one becomes quite apt in making patterns and stamping.

ABOUT WOMEN.

MISS KELLOGG, on account of her mother's sickness canceled her engagement at St. Petersburg, and has gone to Nice.

OLIVE LOGAN says that American women should learn that it is as vulgar to dress splendidly for a hotel dining room as for a railroad journey.

MISS KATE PRIDEMORE, a talented young authoress, residing in Sioux City, Iowa, is a lineal descendant of Addison, the great English essayist.

MISS HARRISON, who is now Lady Arthur Hill, receives a royalty of $4,000 a year for her ballad, "In the Gloaming." She was formerly a governess.

MRS. YOSHIDA, wife of the Japanese minister at Washington, is described as a pleasant little lady and the happy mother of the first Japanese baby born in America.

MISS EMMA KINNEY holds the position of engrossing clerk of the Senate in Nebraska, Miss Outcalt, enrolling clerk and Miss Strickland engrossing clerk of the House.

MARIE VAN ZANDT appears to be the coming prima donna abroad, as, including Ambrose Thomas, no less than six composers are writing works for her acceptance. She sings "Dinorah" at her reappearance in Paris this month.

MISS KATE SMITH, an inmate of the Union Home for Old Ladies in Philadelphia, after three years' labor, has completed a quilt containing 55,552 pieces. She has been blind from infancy, but threaded every needle herself, and used 100 spools of thread in the work.

DORA YOUNG, a favorite daughter of the Prophet and one of the heirs of a large portion of his property, was lately to be seen at a Chicago hotel, and is described as a fine-looking person, dressed in good taste in black satin and brocade, with costly rings on her shapely hands. Her manners are pleasing, and her conversation interesting. She is attached to the memory of her father, although she is no longer a Mormon, calls the system a dreadful one, and says that the Mormon wives under their outward semblance of good-will, hate each other with a deadly hatred.

CORRESPONDENT'S CORNER.

ETIQUETTE.—Being an attentive reader of the RURAL for several years I have noticed that articles on good behavior have been very few and far between. Now if our paper is to be truly a "home paper," why do we confine the few suggestions we make entirely to dress and decoration of the house which can only please the eye, while many of us are daily perplexed with our ignorance of the rules of etiquette? Methinks I hear some one say "such knowledge is to be gotten from books on decorum and the like rather than from the columns of the weekly papers." Very well, you *can* enlighten yourself to some extent in this way but my experience has taught me only the fundamental rules of good manners without entering into the details.

Now I think if those of us who have questions we would like to ask on this subject would only be free and not feel afraid to show our ignorance, undoubtedly there would be many to come to our rescue with answers. In this way we might find ourselves much more deficient than we really gave ourselves credit for. We would learn, perhaps that we were repeatedly committing some blunder without thinking anything about it. For my part I have ever so many questions to ask that I have been unable to find in any book of etiquette, and which my good sense fails to answer satisfactorily. For instance a lady receives invitation from a gentleman to attend a party or for an evening's ride. She says she will be pleased to accept; now as it is strictly improper for a lady to thank a gentleman for his company, what should she reply to his thanks for her company? Is it proper for a lady to thank a gentleman for his attentions? Is it always the gentleman's place to ask to call? Should one or more persons be introduced to each member of a company or as a whole? Is it ill-bred to bow from a window?

These few interrogatives which I have mentioned as examples may seem very simple to some, but perplexing to others who do not know just what is correct. I shall be very much pleased to have some of the wise correspondents answer, and also make other suggestions on good behavior, *i. e.*, if such a subject will be deemed appropriate for this department. RURAL SISTER.

P. S. What is the best common sense work on etiquette?

Remember that a little Hop Bitters saves big Doctor bills, and cures when all else fails.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

ALL-DAY VISITS HERE AND THERE.

ADELINE E. STORY.

"EVERYTHING goes as it happens at Diller's, indoors and out." I thought of this oft-repeated saying of the neighbors as, wrapped in a convenient mantle of invisibility, I entered the kitchen where Mrs. Diller holds sway, and ensconced myself in an out-of-the-way-corner preparatory to taking notes of all I saw. Who has not at some time wished to be a "mouse in a corner" to hear and see, unobserved, all that passed, nobody to be put out by the untimeliness of the visit, or to make unfriendly criticisms when it is over? I found Mrs. Diller in the pantry picking up dirty dishes for her daughter Sarah to wash, and from the fact that these had to be soaked for some time in hot water, I came to the conclusion that the picking-up process was gone through with only once in a while—perhaps only when rendered necessary either by a lack of clean dishes or shelves whereon to stand dirty ones. I was wondering why Sarah didn't think she would need more water than that in the half-empty kettle, when in came Tommy to know if he hadn't better stay home from school "'cause there was a hole in his pants?" Then followed Fred to "hurrah" that he was going to stay out to help his 'pa lay up the lane fence; whereupon Mollie teased to stay out too. She didn't like to go alone, and she "wanted to see 'pa and the boys tear down the hen-house; 'pa said he was going to this forenoon."

The school question was still unsettled when in came Mr. Diller for some fire-brands. He was going to set fire to five acres of brush and the three children tromped out after him—Mollie to see the dog catch the rabbits that would be sure to run from the brush heaps, and the boys to help to set them. Their going left Mrs. Diller a chance to think, and what she thought was that the washing had better be done that day. So Sarah left the dishes and got the boiler over, while Mrs. Diller gathered up the dirty clothes. Every closet and bedroom in the house furnished more or less. Table-cloths were produced from a "cubby hole" under the chimney and napkins from under the pillows in the baby's crib. Dresses were overhauled for collars, cuffs and handkerchiefs. When the pile was made up in a corner of the room, Mrs. Diller sat down to rest, and Mr. Diller returned to say that the brush didn't burn first-rate and he had made up his mind to kill the pig. He was very glad, he said, that the boiler was on and the water hot. It would save time. So the wash water went to scald the pig, and Sarah stuffed the dirty clothes into two pillow-cases with the remark that they were *picked up*, and she counted the washing as good as half done.

Mrs. Diller didn't care so much about the washing. She had a pain between her shoulders and now she could have a chance to tear rags for the carpet. With that she brought out some bright-colored worsted dresses and set herself to ripping them to pieces. At this juncture a neighbor came in and declared that it "looked to her like a poor plan to tear up good dresses that could be made over to look like new for *an old rag carpet*." But as Mrs. Diller never thought it paid to make things

over, and as, moreover, she wanted good colors in her carpet, she went on with her work till breadth after breadth of the really good dresses was torn into rags. Sarah was down on her knees before the stove blowing vigorously at a solitary live coal to coax it into a blaze, when her father called from outside to know if there was any more hot water. On being told that there was not, he came in declaring that the hairs wouldn't come and he didn't know any other way than to finish up with the razor, that it was an old thing and that he should never get a new one unless he finished it somehow. By twelve o'clock the pig was dressed and Mr. Diller and the boys came in to wash. "Where's the soap?" To this question Sarah replied that "there wasn't any, unless it was that in the shaving cup," and Mrs. Diller remarked that they couldn't have washed anyway, and that somebody must go to the store that afternoon and get some. Upon this she was reminded by Mr. Diller that his mother always made her own soap and that she never got out.

Mrs. Diller said nothing, for before she could frame a fitting reply a wagon drove up and stopped. Sarah withdrew her hands from the water in which she was washing potatoes for dinner, and gave her hair one downward brush with them as Tommy informed the family from the window that it was John Goff's folks and that "Sarah's beau was with 'em." Poor Sarah! her dress was dirty, her hair rough and the room untidy. "They'll come right into the kitchen of course; people always do. What's the good of a front door, I'd like to know?" Seizing the first cloth she could lay hold of—the dish cloth, as it happened—she wiped a puddle of water from one chair and brushed some bread crumbs from another. She "chucked" a pan of sour dough into the safe, thrust a pair of boots and two pairs of socks under the lounge, and turned with a very red face to speak to the visitors.

In the course of the afternoon dinner was got ready. On setting the table Sarah had found only an empty plate under the dripping-pan, where she had hidden a pie, and Master Fred got several angry pinches, slyly given, for purloining the same. The pie was gone, she told her mother, but there was the cake. But no; the cake-box had been left unlocked, and it was found empty. The pinch the urchin received on this discovery must have been given with no soft touch, as it caused him to cry out, "You be quiet" in a way that made the "beau" ask, in some concern, what was the matter. His reply, "Sarah keeps a-pinching me," did not seem very soothing to that young lady's feelings. Altogether the dinner did not pass off well. The baby was cross, and Tommy had to be sent from the table to 'tend her. That made *him* cross, and the result of that was a scolding from his father. Mrs. Diller was profuse in apologies. Her bread was too poor to be eaten; the butter had had but one working on account of their having been so busy that morning; the meat, she was afraid, was cooked too fast, and the tomatoes she just knew were scorched. Sarah said nothing; her face showed only one feeling—intense mortification. "See if I don't have things different after this," was her ejaculation when the visitors had departed. It was getting dark before the dishes were again washed and put away. It was so late Mrs. Diller concluded to have bread and milk for supper. After that the pig was brought in and laid on the table as being the only place safe against cats, and I took myself away, satisfied that where things go "just as it happens" they do not always go as well as they might

ANOTHER WEEK FROM MRS. CLAY'S JOURNAL.

ANNIE L. JACK.

WEDNESDAY—"Keep a thing seven years and it comes to use at last." So I said to-day, when unrolling bits of lawn and fine muslin from the piece-bag, I found enough to make baby rich in bibs and pinafores. How different these stray savings looked when able to be utilized. It was only a roll of pieces before, but they have suddenly become worthy of interest and will blossom into a steady usefulness. Some lives are of this kind—nothing but a blank surface, uninteresting to all until they find their place in the world. Children are always at their best when they can be of use, and made to feel that you *need* them. So when Alex. comes to me and says, "Me want to work," I devise some occupation that will satisfy him; he is of great help to me, and it not only makes him happy, but teaches him habits that are valuable.

For the first time in my life I have succeeded in forcing the Lily of the Valley in Winter. It blossomed all the month of March and was a cheerful and fragrant box, the admiration of all who saw it. We took up plants in the Autumn, and left the box out-of-doors till Christmas; then brought them in and stowed them away in a shaded corner. No great amount of sunlight is needed, until the spikes of bells are formed when they need a little more light for perfecting their whiteness. I think my previous failures have been from too great care in Autumn and from not allowing the December freezing before forcing, which is as near as possible to the natural condition of the plant.

The most disagreeable duty of a housekeeper in cold weather, where no help is kept, is lighting the fire of the cooking stove. This imperative duty we found the most irksome, and took it in turn weekly to share the task. Lonsdale has now taken entire charge of this department for a trifling sum, and though he is not *always* "up first," it is a great help when he seems so willing to attend to it. The offer to do it being at first spontaneous on his part, caused me to tender him a trifling payment for his services. I always find children like pocket-money they have earned better than any that is given them for nothing.

A NEW STYLE OF MEDICAL PRACTICE.

EVERY family should have a medicine chest. It should have three divisions in it, of about equal size. Fill the first with *wheat flour* ground extremely fine, the second with coarse *Graham flour* and the third with *red flannel*. Never allow any of them to be used except for medicine, and use them as follows:

FOR DIARRHŒA, make of the wheat flour, a little milk and a pinch of salt, a minute pudding simply by boiling; let it be well cooked, and made very stiff. Eat it with pure *white* granulated sugar and a little milk at every meal till relieved.

FOR CONSTIPATION, make a cake or loaf of the Graham flour, and eat of it at every meal until relieved. For chronic complaints, these two dishes are the safest and best for a regular diet.

FOR A COLD on the lungs or chest or in the throat, take a piece of the flannel of sufficient size to reach from shoulder to shoulder and from the back of the neck down to the waist, tack it fast to the inside of the undergarment, and let it hang down the *back* next to the skin; wear it night and day till cured, and when cured take it off only upon going to bed. If these simple and inexpensive remedies are applied at once, without waiting for the complaint to become established, there will be very few sick people, large or small, and very little call for the doctor. MEDICO.

QUESTIONS FOR MRS. MARY WAGER-FISHER.

IS THERE any reason why "old-fashioned people" should crucify themselves simply because fashion dictates that they should not convey food to their mouths with the knife, without regard to convenience or the nine chances out of ten in favor of the knife, as to goring or cutting the mouth? Is there any reason why farmers should not do as they have earned the right to do, shovel, if you please, their food in an easy and natural way, as they do their grain, without affectation? Is there any reason why the "stuck-up" daughters should not sit in the corner and wait while the true and honest old father and mother cool and drink their tea from the saucer, and not from the scalding cup? Is there any reason why the mothers of to-day should not teach their children the respectful "yes, sir," "no, sir," instead of the flat, disrespectful "*yes*," "*no*?" Can you tell me why he who lifts his hat and makes a polished bow is more worthy of trust than he who nods his head and greets you with the weather-beaten "How are you?" Can you tell me why a lady should not show her smooth and intelligent forehead instead of her idiotic bangs!! Why is it not just as respectful for a gentleman to enter your house with hat upon his head, or to enter and thus sit in church, as it is for the lady by his side? Pray tell me, if you can, how much is added to true worth of character, to nobleness of soul, by many of the humbug fashions of the day? BUCKEYE.

That Robbin's Washer.

I have used the Robbin's Washer for a year and a half and it is as free from rust to-day as the first time it was used. But I have always seen that the person using it washed it in *clear* water without soap and thoroughly dried it before putting it away. The neglect of this is no doubt the reason why so many complain of the washer rusting. MARY B.

$500 will be paid for any case that Hop Bitters will not cure or help. Doubt not.

Miscellaneous.

VANSICKLE'S
Shir Sling, Hay & Grain Unloader
HAS NO EQUAL.

Its Economy,
One-half time, labor and expense.

Its Capacity,
Double that of any Horse-Fork.

Its Convenience,
Unparalleled in Changing.

Its Adaptation
To all kinds of farm produce.

Its Facility.
A boy twelve years old can operate it easily.

Its Cleanliness,
25 loads unloaded and did not scatter one bundle.

WARRANTED in all the above statements, and to give satisfaction. For descriptive circular, address
G. VAN SICKLE & SON,
Shortsville, N. Y.

STOCKBRIDGE
MANURES
SEND FOR PAMPHLET.
These manures are the richest fertilizers now manufactured, and the best substitute for, and costing *much less* than guano, which is now practically out of the market. Unlike guano, they *are not stimulants* and *exhaustive*, but *permanent* and *lasting*, being composed of bone, potash, etc. You can draw at one load enough for 3 to 5 acres, or as much plant-food as is contained in 20 loads of ordinary straw manure. Corn, potatoes, hay, etc., are bringing such good prices that it will pay to use the Stockbridge extensively. If there is no local agent near you, send to us.

THE NEW SHEEP DIP.
Little's Chemical Fluid.
Non-Poisonous. Non-Corrosive.
Specific cure for Scab, Mange and any skin disease. Ticks and Lice on all animals, Fleas on Dogs, Worms in the Throat and Internally, as well as sore eyes in Sheep and lambs.
It is before all other dips in the simplicity of its preparation. It mixes at once with cold water, and a single trial will prove that on coming into contact with the water the whole is changed into a milk-white Dip, which is distinctly not the case with any other material. Dispenses entirely with fires and boilers, which are necessary with Tobacco and other Dips. The sheep may be dipped with perfect safety in the coldest weather.
Send 3 cent stamp for Testimonials and prices to

USE ONLY THIS THE FIRST AND THE BEST

News of the Week.

HOME NEWS.

MONDAY, April 25, 1881.

The floods are still raging in the West. At Fond Du Lac, Wis., many of the streets were submerged by the overflowing river and were navigated by boats. Families were compelled to vacate their houses in several wards of the city. The damage is great. At Rockford, Ill., it is the busiest season with the manufacturers, but the recent floods throw some 1,500 men out of employment. At Elgin, Ill., buildings were swept away, railroad tracks were washed out and large bridges destroyed. Damage done to property there will amount to $200,000. Hundreds of men worked continuously to to protect the manufacturing interests at Rock Falls, Ill. At Fort Atkinson, Wis., all the low lands near the river were flooded. The ice rushing down the stream carried bridges, dams and everything before it. It is estimated that $300,000 worth of property have been destroyed in Kane Co., Wis. Heavy losses are reported in Minnesota and Nebraska.

Kansas has received into her limits and cared for over 10,000 of the freedmen since the exodus began and has been the means of turning 10,000 more into other States. All attempts to check the incoming of the colored people have failed as they are bound "to come to Kansas, the home of John Brown."

On the 19th inst. 6,891 immigrants landed at Castle Garden, this city, and on the 21st 4,000 more. Eight other steamers are due this week from Europe, carrying immigrants. The following statistics give the total number of immigrants landed in the years named:

In 1876	68,264	In 1879	135,070
In 1877	64,536	In 1880	327,371
In 1878	75,347		

A comparison with last year shows:

	1880	1881.
January	5,677	8,083
February	7,90	9,758
March	21,994	27,703

The Buffalo, New York and Philadelphia Railroad, running from Buffalo to Emporium, on the Philadelphia and Erie Railroad, with narrow-guage connections, has been purchased by a syndicate composed of the following gentlemen: J. & W. Seligman, Drexel, Morgan & Co., Winslow, Lanier & Co., Kidder, Peabody & Co, Clark, Post & Martin, and E. W. Clark & Co.

Ex-Gov. Morgan, of New York, has added to the $100,000 given a year ago, for erecting a library building for the New York Union Theological Seminary, a still further donation of $100,000 toward purchasing a site for the building. The erection of buildings for the uses of the seminary is contemplated, one of which will be named in memory of the late President Adams.

In a test case at Milwaukee on the 20th, to determine the legality of the celebrated anti-treating law of Wisconsin, it was found that the law was inoperative, because of an error in the text of its supposed enactment. The bill as drawn specifies the repeal of an old law that was dropped when the State statutes underwent their recent revision, and Judge Mallory held the law to be inoperative and void. The Illinois State legislature has reported favorably on an "anti-treating" bill. It imposes a penalty of $10 for each offense.

In a little over three months about $25,000,000 in specie have been imported into this country; and since January 1, 1879, about $200,000,000 of gold in coin and bars has been brought here.

The twelfth annual reunion of the Society of the Army of the Potomac will be held in Hartford, Conn., June 8th. General Wright will preside. Daniel Dougherty, of Philadelphia, will be the orator and Captain Summer, of Bridgeport, Conn., the poet of the occasion. It is expected that President Garfield and Generals Sherman, Sheridan, Slocum, Hawley and other officers will be present.

The new Postmaster General is instituting searching investigations into the mail service, and the need thereof is great. Mr. James will do well if he can bring some of these public swindlers to punishment. Gen. Brady, Second Assistant Postmaster General, has been discharged on account of his connection with the mail service frauds, and "there's more to follow."

The regular meeting of the World's Fair Commission was postponed until the 27th inst. in order to give the transportation companies time to increase their subscriptions. But there is little hope now of having the Fair in 1883. One of the Commissioners recently said:—"We are preparing to surrender the thing with decency and dignity."

There will be a convention at Davenport, Iowa, on the 25th of May to consider the most feasible plans for an enlargement and extension of water routes of communication between the great rivers of the West, the lakes and the ocean. Congress will be asked for appropriations to this end. The Governors of the States interested will appoint 10 delegates; each organized Board of Trade, five; each city or town having no Board of Trade, five; and each regularly organized Farmers' Alliance, three.

Senator Frye, of Maine, the youngest man in the Senate, "stirred up the camp" the other day by a vigorous speech against the Southern policy, and Mr. Coke of Texas, Mr. Call of Florida, Wade Hampton of South Carolina and others have felt called upon to reply to the charges made by the new Senator from Maine.

The old home of Lincoln was recently torn down at Springfield, Ill. A boy bought all the shingles for a dollar, and, with a scroll saw, is turning them into ornamental mementoes, which he easily sells at from 50 cents to $1 each.

What is fame anyhow? An Athenian paper publishes the Cabinet as: Secretary of State, Blanne; Treasury, Nin; Navy, Kelnf; Interior, Verkoyed; Postmaster General, Reames; Attorney General, HacVragh; War Secretary, Lincoln.

It is suggested that the good time coming when swords shall be turned into plowshares, etc., has dawned on Atlanta, Ga. The Christian Index, a religious paper published there, has a font of type cast from bullets used by the Union and Confederate armies before General Sherman entered the city.

A Wonderful Remedy.

Mr. R. P. Lewis, of East Saginaw, Michigan, writing to the editor of the Laporte (Ind.), Argus, says: "I wish you would allow me to say, over my own signature, a word in behalf of a remarkable curative agent—Compound Oxygen. It is not a medicine but a vitalizer, and its effects are natural, direct and permanent. Its use involves no risk or inconvenience of any kind. I speak both from observation and experience. I was induced to try it by the recommendations of such men as T. S. Arthur and Judge Kelley, and also a personal friend, *and have found it more than was promised.* This was over six months ago, and the *good effects have been permanent.* A gain of fourteen pounds in six weeks was the avoirdupois result, but my general spirits were lightened up at least a ton. There are three other men here who have tried the Compound Oxygen with even more striking results, and I am acquainted with the history of each case. One of them lost his voice last winter, and was so run down in general health that little hope was entertained of his recovery. The Oxygen cured him without change of climate or stopping work, and he says he is as well as ever. Another, who had worked for years as a paying-teller in a bank, and was all used up and not expected to live beyond a month or two, took the Treatment, and is a hundred per cent. better and recovering rapidly. Another, who was in the last stages of consumption, has tried it and is greatly improved. *He tells me he would have been dead long ago but for this remedy.* I have no axe to grind in making this statement, and if you should not publish it I would lose nothing by the refusal, though if you should others might be benefitted, which is all the end I have sought to compass." Any who may desire to investigate the claims made for this new and natural remedy, can receive pamphlet, testimonials, etc., postage free, by addressing MESSRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

FOREIGN NEWS.

At the ripe age of three-score and seventeen Benjamin Disraeli, Earl Beaconsfield, died in London, on April 19. His career was one of the most extraordinary in English history. Belonging to the Hebrew race against which, until lately, there was, in England, a bitter prejudice, which has not entirely disappeared yet, by genius and energy, unaided by family connections, in a country where family connections are all-powerful, he made himself leader of the House of Common, Minister of Finance in the most commercial of countries, and Prime Minister of one of the mightiest of modern empires.

[Des Moines Iowa State Register.]

We notice the following in an exchange: Mr. G. B. Haverer, Foreman N. Y. & N. H. S. B. Co., suffered for eight days with terrible pain in the back, almost to distraction, until he heard of and used St. Jacobs Oil, one bottle of which cured him comptetely.

AGRICULTURAL NEWS.

THE University of Vermont and the State Agricultural College form one institution, and have together the present year 321 students, of whom 143 are medical students, leaving 78 to pursue either the agricultural or classical course.....A telegram from Chicago on the 20th says that an unknown disease has broken out among the horses of that city. It begins with a swelling just below the fetlock, which after a little time, festers and becomes a discharging sore. It yields slowly to treatment; but unless taken early, the poisonous matter spreads itself upward and infects the blood, causing death The horses are, in any case, laid up from two to three weeks. About 350 horses belonging to the omnibus and express companies were laid up with it, to say nothing of the illness among the large number of other horses in the city....The butter dealers of Washington Market—the largest in this city—have unanimously agreed that they will not handle oleomargarine in any shape, so that they will henceforth sell it neither as butter nor oleomargarine.....Talk about the Jerseyman who stole that red-hot stove! here's a Kentucky man got away with four hives of bees!.....Gov. Ordway, of Dakota was in this city during the past week seeking relief for the 7,000 sufferers by the late Missouri flood. He says from fifty to a hundred thousand dollars are needed to relieve the present distress .....Lately 473 horses were on exhibition in Paris, France, competing for prizes aggregating $62,500....Turkey is the last European country to prohibit importations of our hams, sausages, pork and bacon....Reports dated Feb. 6 from the Argentine Republic say the wheat crop had just been saved in splendid condition; and farmers were asking high prices. Potatoes were the largest crop ever grown and, of course, prices had therefore fallen.....In New Zealand, according to early Feb. reports, wheat about to be reaped promised an abundant crop, and the area under it would be sure to increase for the next few years. The wool clip was the best ever known.

Arable land in England has been gradually decreasing in area, the decrease in five years being 442,000 acres; and there has also been a decrease in the number of cattle, a decrease of no fewer than 3,000,000 sheep since 1874, and an appreciable reduction in the number of pigs and horses..... The S. E. Australia Minister of Railroads, of Victoria, refuses compensation for damage to crops by sparks from engines, and expresses a belief that ricks are often placed where they may best catch fire.....It will be remembered that about two years ago, just after the English embargo on importations of American cattle, we announced that by order of Governor Robinson, of this State, the distillery cow stables of Graff, Fleischman & Co., Blissville, L. I., were quarantined to prevent the spread of pleuro-pneumonia from a lot of infected cattle on the premises. The above firm now claim $2,400 for rent which they could have got for the stables during the period of quarantine and $300 for board which "humanity obliged them to furnish to the imprisoned cows;" and the Supreme Court here has just ordered Gov. Cornell to show cause why the claim should not be paid out of moneys appropriated by the Legislature to prevent the spread of infectious and contagious diseases among cattle.

Mr. C. F. Mills, Springfield, Ill., announces that entries for the first volume of the American Clydesdale Stud Book close this month.....A disease called "black itch" has just broken out among cattle in Jones Co., Iowa. The affected animal violently scratches its head until the hair is rubbed off, and death follows in about two days. It is thought to be non-contagious..... The Governor of Michigan has appointed April 28 as Arbor Day, the idea being to devote the day throughout the State to the planting of ornamental and shade trees.....Strawberries sold on the Chicago market last Wednesday for 60 cents per quart. They were shipped from Mississippi..... .....J. H. Paine, of Wisconsin, has been appointed Chief Clerk of the Department of Agriculture to succeed Gen. E. A. Carmen, relieved.

California produced 10,000,000 gallons of wine during 1880, of which 700,000 gallons were sweet wine. Of brandy, 450,000 gallons were manufactured; also raisins to the value of $100,000. The sale of grapes for table use yielded $150,000. The total yield from the culture of the grape during the year 1880 amounted to $3,500,000... ...The Dakota floods have covered 227,000 acres of the richest Missouri bottom farms.....One of the largest cattle transactions ever made has just been closed by Messrs. Hughes of St. Louis and Simpson of Weatherford, Texas, purchasing the famous Millett ranch near Dallas, Texas, for $300,000.

Rail freights from Chicago to New York have been advanced to $6 per ton. They were $5 per ton on grain for a very short period.....In California and Oregon it is expected there will be 500,000 tons of wheat available for export, for which there will be no vessels to carry it until the present crop season shall have lapped on to its successor.....The New York canals will probably not be opened until from May 12 to 15..... The exports of wheat and wheat flour from Atlantic and Pacific ports since July 1st, 1880, have been equal to about 152½ million bushels of wheat.

The exports of grain from Lyttleton, New Zealand, have been:

	1880.	1879.	1878.	1877.
Flour, tons	4,529	5,063	6,596	5,474
Wheat, bush	3,583,943	1,314,926	1,175,514	983,029
Oats, bush	1,181,626	185,571	213,618	388,137
Barley, bush	323,847	80,461	101,416	98,680

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and seaboard ports and on rail from Western lake and river ports and frozen in on New York canals:

	1881. April 16, bush	1880. April 17, bush.
Wheat	20,456,502	23,002,047
Corn	13,378,708	13,969,947
Oats	3,050,061	2,085,255
Barley	1,599,935	1,350,585
Rye	329,644	544,070
Total	38,814,870	40,951,904

The Duchess of Marlborough has completed arrangements for the entire outfit of fifteen Irish families, who will be provided with free passes to Manitoba and located there in neatly-furnished farmsteads.....Land Commissioner Corlin, of the St. Louis & San Francisco Railroad, closed on the 14th inst. the sale of 138,000 acres of land in Barry County, Mo., to the Missouri Land Company of Scotland. A large number of Scottish colonists will be settled on the land.....According to statistics published in the Ceylon Observer, there are now 35,000 acres in the island planted with cinchona, the total number of plants being nearly 100,000,000, valued at $10,000,000. About 10,000 acres are planted with tea, giving an annual yield of 500,000 pounds. They relative importance of coffee in Ceylon has greatly declined.....The Brazilian newspapers were, at last accounts, discussing a law submitted by the Minister of Agriculture to the late Parliament for the creation at many points in the Empire of practical schools of agriculture, combined with model farms, similar to those in France, whence owners of estates can get superintendents.....The Secretary of the Interior has received a circular issued by the "Freedmen's Oklahoma Association" of St. Louis, J. Milton Turner, President, and Hannibal C. Carter, General Manager. It promises 1,600 acres of land to every freedman who will go and occupy the public lands of Oklahoma. Secretary Kirkwood has referred the circular to the Commissioner of the General Land Office, with a view to ascertaining the legality of the proposed occupancy of the Government reservations in that Territory.

In 1877 M de Lavergne estimated the value of the agricultural produce of France at $1,500,000,000—including wine, cattle and all other products of the soil. In 1878, Mr. Caird, who is to England what M de Lavergne is to France, estimated the total value of the agricultural products of the United Kingdom at $783,000,000. The area of France is double that of the United Kingdom..... ....The largest peach orchard in the world is said to be in Chambers county, Ala., near the Georgia line. It contains 250 acres, has yielded $70,000 worth of peaches and is owned by John Parnell, a brother of the Irish agitator. He came to this country some dozen years ago, and bought an old and worn out farm, which he has converted into this immense peach orchard, and is always the first to have early peaches on the market, for which he receives high prices. He is getting rich at the business.....The importation of American apples into Bristol, England, reached 14 543 barrels in 1880. The export trade in green or ripe apples from the United States has fluctuated widely heretofore. In 1870 the value was $230,000, declining somewhat in the next two years, but suddenly rising to $820,000 in 1873, falling to less than one-fourth that in 1874, and nearly recovering in 1875; it dropped again to $222,000 in 1876, rose to nearly a million in 1877, and dropped to nearly one-third of that in 1878; rose to $978,000 in 1879, and to $1,190,000 in 1880.....Owing to the increased demand and ready sale of Merino sheep throughout Addison Co., Vt., the listers in several towns are appraising them at $15 per head for entire flocks, which makes dissatisfaction among real estate owners, who are well aware that these Merinos will sell readily at from $20 to $50 per head for entire flocks. Single sheep in some of these flocks are worth $500 to $1,000 each, and the owners in several instances have refused to dispose of them at those prices, ... In Vermont there is some complaint among farmers that an unusual number of their dairy cows have "gone farrow" this season, which is attributed to drought so prevalent last Summer.....The Vermont Maple sugar the past season has never been surpassed for quantity and quality. Farmers report four pounds per tree in some orchards.....In one hundred years no three consecutive Januaries in England were so cold as the three last.....

Tormenting Piles.

Kidney-Wort is an unfailing remedy for that tormenting disease piles. It moves the bowels gently and freely, and thus removes the cause. Do not fail to try it faithfully either in dry or liquid form.—Sun and Press

LYDIA E. PINKHAM'S VEGETABLE COMPOUND is a remarkable remedy for all those painful complaints and weaknesses so common to our best female population. Send to Mrs. Lydia E. Pinkham, 234 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

No one can be sick if the stomach, blood, liver and kidneys are well. Hop Bitters keeps them well.

BURNETT'S COCOAINE

Softens the hair when harsh and dry,
Soothes the irritated scalp,
Affords the richest lustre,
Prevents the hair from falling off.
Promotes its healthy, vigorous growth.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, April 23.

Boston.—WOOL.—There is a steady demand for wool and prices are more settled than for some previous weeks. It looks as if bottom prices have been reached for fine Fleeces, and manufacturers have been operating more freely. The sales of the week have been upward of 2,000,000 pounds, of which 468,000 pounds were fine Ohio, Pennsylvania and Virginia Fleeces at 40c@41c for X, 40@42c for XX, and 43c@44c for XXX and fancy clips, and best XX Fleeces are now firm at 41½c. Michigan and Wisconsin X Fleeces have been selling at 37@39c, Vermont X at 35c, and New Hampshire X at 37½c. There is more doing in California Wool, with considerable inquiry for neighboring markets, New York buyers and others looking around. The sales have been 415,000 pounds, at 18½@30c for Spring, and 14c@25c for Fall. Pulled wools have been in demand, with sales of 331,000 pounds, including large lines of Western Supers at 32c@37c, and good and very choice Eastern at 40@50c. Some considerable X pulled has been sold at 35c@40c. In Unwashed Fleeces there have been sales of 280,000 pounds of all grades and quantities including the best mediums at 30c@32c. Combing and Delaine Fleeces are quiet, with a few sales of fine Delaine and Combing at 41c@45c, and unwashed at 30c. Coarse Combing Wools are dull Foreign Wool has been quiet, with sales of 144 000 pounds Australian at 39c@42c and 40,000 pounds, Montevideo at 30c@32c. Montevideo Wool is held with more firmness, but it is a hard article to sell on account of the small number of manufacturers who use it. Carpet Wools have been quiet.

Chicago.—Wheat unsettled No. 2 Red Winter, $1 11@1 11½; No 2 Chicago Spring, $1 04½@1 04¾, cash; No 3 do. 94c@$1; rejected 76c@84c. CORN active at 43½c. bid, cash, May, and June. OATS irregular at 36½c. RYE firm at $1 20½. PORK unsettled at $17 40, cash and May; $17 47½@17 50, June; $17 60, July. Lard active at $11 20, cash; BULK MEATS unsettled; Shoulders $5 75; Short Rib $8 50; Short Clear $9. BUTTER Creamery choice 32@33c; creamery fair to good 29@30c; dairy, choice 25@27c; dairy fair to good 20@24c; packing stock 13@15c; Grease 8@10c. CHEESE, full cream 13@14c; part skim, choice 10½@11c; part skim, fair to good 9@10c; part skim, hard 7@8c; low grades 4@5c. EGGS were plenty at 14c per dozen, SEEDS were a little more active for clover, firm and active for timothy and steady for flax. Hungarian was firm under active inquiry. Prime clover ranged at about $4 40@4 60, prime timothy at $2 55@2 60 and flax seed sold at $1 17. Sales were made of 33 bags clover seed at $4 50 for choice medium, and $4 90 for mammoth; two cars and 700 bags of timothy at $2 32½@2 40 for poor to good, and $2 53@2 60 for prime; three cars flax seed at $1 17 on a basis of pure; one car common millet at $2.00. Hogs market unsettled; fairly active; mixed packing $5 65@$6 05; light, $5 80@6 10; choice heavy, $6 20@6 45; culls $5@5 60. NOTE.—All sales of hogs in this market are made subject to a shrinkage of 40 pounds for each piggy sow, and 80 pounds for each stag. Dead hogs sell at 2c per pound for averages of 200 pounds and over, and at 1c. for average of less than 200 pounds. Cattle demand good and prices 10c higher than yesterday; common to fair shipping, $4 70@5 15; good to choice heavy, $5 50@5 85; exports nominally, $5 95@6 35; corn-fed Texans, $4 15@4 75; butcher's slow common weak at $2.50@4 20; stockers and feeders, $3 30@4 60. SHEEP market quiet and slow, but steady; good to choice, $5 60@6; few common and no fine here; prices nominally $4 50@0 25.

Cincinnati.—WHEAT strong; No. 2 Red Winter, $1 12@$1 14. CORN strong; No. 2 Mixed, 48c. OATS stronger; No. 2 Mixed, 41½c. RYE irregular; No. 2, $1 33@1 34½. BARLEY quiet but firm; No. 2 Fall, $1 10. PORK quiet, but firm at $17; held higher. LARD firmer at 11½c. Bulk-meats stronger; Shoulders, 5¾c.; Clear Rib, $8 60. Bacon firmer; Shoulders, 6¾c.; Clear Rib, 9¼c; Clear Sides, 9¾c. BUTTER—The receipts have not been unusually large, but the demand was smaller than it generally is, and prices have declined during the week 2@3c ₩ lb on the better grades, and even more than this on the medium and lower qualities, the latter, in fact are practically unsalable in

any large way. The supply of Ohio Creamery is steadily increasing, and the quality is improving, so that considering the quality the decline is really more than the difference in prices. Fancy Creamery sells at 33c, prime do. at 30@32c., choice Dairy, 35c., choice Western Reserve at 23@25c, prime to choice Central Ohio at 20@22c, medium do at 15@17c and Inferior is offered at 12c ₱ lb. CHEESE—The supply is light, and with a good demand the market rules stronger for choice cured factory, which sells at 12¼@13c, and good to prime Northwestern at 10¾@11¼c ₱ lb. SEED—German Millet is in unusually good demand for this season of the year, and is higher. Prime to choice Clover sells at 7¼@8c. ₱ lb, and Timothy at $2 65@2 75 ₱ bushel from store. Round lots on arrival would not bring these prices. Flaxseed is steady at $1 10@1 12½ ₱ bushel. German Millet sells at $1 55@1 60, common Millet at $1 15@1 25, and Hungarian Grass at $1 05@1 10 ₱ bushel.

St. Louis.—WHEAT—No. 2 Red Fall, $1.10¾, cash; offered at $1.10 at the close; $1.10, April; $1.10¾@$1.11¾, May; $1.09¾@$1.10½, June; $1.04⅝@$1 05⅝, July; $1.01⅞@$1.02⅝, August; $1.00¼@$ 00¾, all the year; No. 4 do., $1 01⅝@$1.02. CORN, 42¾c, cash. OATS. 36¾c, cash; 35¾c, July. RYE firm at $1.20@$1.23. PORK dull at $17.70 asked, cash; $17 70, June. LARD dull at $11 12½, bid. Bulk-meats lower; Shoulders, $5.70; Clear Rib, $8.60; Clear sides, $8 85 asked. Bacon dull; Shoulders, $6.25; Clear Rib, $9.25; Clear Sides, $9.50. HOGS in good demand and steady; Yorkers and Baltimores, $5.75@$6.10; mixed packing, $5.70. Cattle stronger; exporters, $5.60@$6 10; fair to good Steers, $5@$5.50; common to medium, $4.50@$4.90; butchers' Steers, $4.25@$5 90; Colorado Steers, 4 40@$5 25; feeding Steers, $4,65@$4; stockers, $3 60@$4; Indian, $4.15@$4 75; South west Steers, $4.25@$5; Cows and Heifers, $3 50@$4 50. SHEEP scarce and firm; quotations, $5@$6. 15.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 23, 1881.

BEANS AND PEAS.—Beans have again advanced and buyers seem forced to meet the situation. Exporters have appeared and the home demand is good. The crop of white is under good control here and in the interior. Red kidneys slow. Green peas plenty and dull at $1.60 for Wis, Southern B. E. peas firm at $3 per 2 bu. bag.

Medium and marrow beans, prime, $2.60@2.65; other $2.40@2.50; white kidney and pea $2.35@2.50 red kidney, prime $1.50@1.60, other, $1.40@1.50; black or turtle soup $1.45; Lima, $5@5.50.

BUTTER.—Supplies of new have attained a regularity and volume that have started prices downward. Buyers will purchase only for daily wants for a time as quality will improve steadily and no one wants to be caught with much white when grassy yellow is a feature. Any style of new that is at all below choice drops suddenly into the low scale of figures, New Western is quoted but not heavily as yet as intermediate markets absorb a good deal of first crop of later years. Old butter weakens as the tops of lots go off.

New Butter.—Creamery, choice Western and Pa. 28@30c, other, 22@26c; sweet cream, 24@26c.; State half tubs, choice, 23@24c; fair to prime, 20@22c, Welsh, choice, 22@23c; other 19@21c.; very common or stale new 15@18c.; Western imitation creamery 20@24c.; do dairy 15@22c.; factory 17@21c.

Old Butter.—State dairies, 18@20c.; pails and half tubs, 18@20c.; Welsh, 18@19c.; fine Western, 23@25c.; fair to good, 12@20c.; very poor. 12@13c.

Receipts for week 22,951 pkgs.

Exports do. 601 do.

CHEESE.—Export demand continues small and the home trade moderate with prices, however, held steady The best new creamery have sold at 13¼@13½c. Quotations are for

Fancy at 13¾@14c.; do. good and prime, 12¾@13¼c.; do. fair, at 12@12¼c.; do. half-skimmed, 8@9c.; Wisconsin factory, fine, at 13¾@13½c.; do. good to prime, 12¾@12¾c.; do. fair to good, 11@12c.; Ohio factory, fine, 13@13¾c.; do. good to prime, 11¾@12¼c.; do. flat fair to good. 10¾@11½c.; do. poor to fair. 8@10c. Skimmed creamery, 8@8c.

Receipts for week, 14,910 boxes.

Exports for week, 14,300 boxes.

Liverpool cable, 69s.

Steam to Liverpool, 21s.3d.@25s.

COTTON.—Trade has been very slack this week with prices varying slightly only; latest prices are for

April, 10 53@10.54c.; May, 10.65@10.75c.; June, 10.64@10.65c.; July, 10.74c.; August, 10.8c.; September, 10.50@10.51c.; October, 10 14@10.15c.; November, 10.02@10.03c.; December, 10.01@10.03c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

EGGS—Receipts for week, 11,850 bbls.; do. last week 21,078 do. The market was well cleared for Easter use and with limited arrivals prices have held up unusually well. Quotations, however, are tender at the close, as Spring produce is becoming plenty enough to call home trade away from eggs and any material accumulation of the latter will at once depress prices. Duck and goose eggs have declined and will not recover, as their season is over.

Near points, 19¾@20c.; State and Pa., 19@19½c.; Western, 19c.; Southern, 18½c.; poorly packed and small run 17½@18½c.; goose 35@38c. duck, 22@24c.

FLOUR.—There is a more active market, all grades participating in the trading with prices stronger.

Latest prices are: $3.80@4.60 for very inferior to strictly fancy superfine State and Western; $4.45@4.70 for poor to choice extra State and Western, odd lots and lines; $4.70@4 85 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4.30@5.60; good to choice do at $5.60@6.35; (very choice up to $6.50 and fancy at $6.75;) red and amber winter wheat, inferior to choice trade and family at $4.30@6.25; round hoop Ohio, $4.30@4 85; and trade and family brands of do. at $6.00@6.25, the latter for very choice; St. Louis $4,75@6 65 for inferior to good extra; $5.65@6.50 for good to choice, and up to $6.75@7 for very choice to very fancy brands; Minn. clear, inferior to very choice at $4.45@5.85; Minnesota "straight," poor to very choice, at $5.30@6.75, and patent inferior to fancy at $5.75@8.00; city mill extra at $5.50@5.65 for the West Indies; do. for England at $4.45@4.75 for poor to choice spring wheat; do. trade and family extras, $5.70@6.75; do. for South America, $5.75@6.00, the latter for very choice; No. 2 at $3.10@3.75 for very poor to very fancy.

Receipts for week, flour, bbls. 98,350; corn meal, do. 4,360; wheat, bush. 1,018,300. corn, do. 616,700; oats do. 500,900; rye, do 6,150; malt, do. 84,750; barley, do. 149,300; beans, do., 6 950; rice, pkgs. 1,025.

Exports for week, flour, bbls. 103,900; corn meal, do. 7,325, wheat, bush 902,675; corn, do, 514,750; oats, do. 2,400; beans, pkgs. 1,174; rice do. 2,327.

FRESH FRUITS.—Exports of apples for week, 5,844 bbls. There is a steady retail demand for fine apples and the supply is fully up to its wants, Baldwins, $1.50@2,50; Russets, $1.75@2.25; these are the main sorts left. Cranberries were over-produced last season, though the bad selling weather has helped to make the surplus which is now such a drug. N. J, crates, 75c.@$1.50. Florida oranges quoted at the old range, $1.50@3.50 for good to best half-bbl cases; season almost over. Florida strawberries are plenty enough to make quite a general use. The closing range for Chas. and Fla. is 20@35c. Hothouse black Hamburg grapes lower, $2@3 ₱ lb. Peanuts dull at old prices; Va. hand-picked 4¼@4½c; good to extra prime 3@3½c; shelled 3@3½c; pecans 7@7½c.

GRAIN.—Wheat has been active, exports for the week reaching 950,000 bush., with prices strong at a somewhat better range; latest sales are of

No. 1 white at $1.23½@1.24¾, do. April at $1.23½@1.24¾; do. May at $1.21@1.22¼; do. June at $1.19¾@1.20¼; No. 2 white at $1.22¾; ungraded white at $1.22@1.23; No. 1 red at $1.31@1.33; No. 2 red at $1.26¾@1.29; do. April at $1.26@1.28¼; do. May at $1.23@1.24¾; do. June at $1.22@1.23½; do, July at $1.20¼@1.21¼; No. 3 red at $1.24¼@1.25¾; ungraded red at $1.18@$1.30; No. 2 Chicago at $1.26 asked; New York No. 3 Spring at $1.18.

Rye at $1.18@1.11.

Corn is in liberal demand and is more in favor of holders; latest prices are for

New York No. 2 at 60@60¼c; do. April at 60@61¼c.; do May at 56¾@57¾c.; do, June at 56@56¼c.; No. 3 at 57¼@58c.; ungraded mixed Western at 57@60¾c; New York steamer mixed at 59¾@60c No. 2 white at 62@62¾c.; white Southern at 60@6'c.

Oats have a good trade demand and prices firm; latest sales are of

No. 1 white at 52c.; New York No. 2 white at 49@50c.; No. 3 while at 49c.; New York No. 2 at 46@47c.; do. April at 46¾c.; do. May at 46¾@46¼c.; do. June at 46@46¾c.; No. 3 at 45¼@46c.; ungraded white; Western at 46@46 c.; ungraded mixed Western at 45@47c.; No. 2 Chicago at 46½c.

HAY AND STRAW.—Demand is liberal and prices strong for prime stock, but other qualities favor buyers. Quotations are

Hay, prime timothy at $1.15@1.20 ₱ 100 lbs.; medium timothy at $1.00 @1.; shipping grades at 85@90c. do.; clover mixed at 95c.@$1.00, clover at 80@85c. do. Straw—No. 1 rye at $1.05@1.10 ₱ 100 lbs.; No. 2 rye at 70@80c, do.; oat and wheat at 50@60c. do.

Exports for week, 4,000 bales.

HOPS.—Export demand is dull and the inquiry from brewers moderate with prices unchanged. Quotations are for

	Cents per lb
New Yorks, crop 1880, choice	22 @23
Do. medium	19 @20
New Yorks, crop 1880, low to fair	12 @15
Eastern, crop 1880	14 @22
Wisconsin, crop 1880	14 @22
Yearlings, crop 1879, choice	12 @18
Olds, all growths	4 @10
Pacific coast, new	19 @23
Bavarians	30 @35

Receipts for week, 884 bales.

Exports do., 425 do.

POULTRY AND GAME.—Dressed poultry continues scarce, firm and high; turkeys sell well for this late date.

Turkeys, prime fresh and frozen 18@20c; good 16@18c.; large coarse 13@14c; chickens Spring 50c; Western 30@33c; yearlings 20@25c.; good prime lots 17@23c; fowls, d. p. 16@17c.; scalded 13@16c. Capons, large, 27@28c.; small 23@26c. Ducks, choice, 22c.; other, 16@20c. Squabs, white, $4 ₱ doz.; do, dark, $2@2.25

Live poultry scarce but better supplies are expected next week.

Fowls, 14@15c.; roosters, 9@10c.; turkey hens, 17@18c.; do. toms, 13@15c; ducks, 65c@$1.25 geese, $1.25@2.50 pigeons, 35@40c.

There is hardly enough of anything except snipe to make a market Ducks not wanted.

Eng. snipe, $1.25@1.37; plover $1@1.25; sand snipe, 50c. No wild pigeons.

PROVISIONS.—Are generally active and closed strong.

Mess pork quoted at $16.25@16.50 for old mess and $18 for new mess. Bacon at 9c for short clear and 9¼ for long clear. Beef hams at $ 2@23. Beef at $21@23 for city extra India mess. Tallow at 6 7-16@6¼ for prime. Stearine at 13@13¼ Lard Western steam at 11.70 for spot lots, 11.75 for May, 11.80 for June, 11.85 for July, 11.92½ for August.

Receipts for week, beef, bbls and tcs. 935 pork, bbls. 670; cut-meats, pkgs. 11,100; lard do. 6,7 0.

Exports for week, beef bbls and tcs., 2 200; pork, do. 3,100; cut-meats, lbs. 3,554,470; lard, do, 3,163,275.

SEED.—Clover is quiet at 8¼@9c. Timothy is inactive at $2.80@2 95.

VEGETABLES.—Potatoes are higher; have been up to $3.25 during the week for choice double-head stock. Receipts have enlarged, but the market is strong for prime quality; demand almost exclusively local.

Bermuda potatoes $9@10 ₱ bbl.; 2d crop $7@7.50; Early Rose, Nova Scotia d.h. $2.87@3 00. Maine $2.87@3.00. State $2.62@2 75 do. bulk. $2,62@2 75. Prolific, $2.25@2.50 Mercer, $2@2 25 Jackson White, d.-h., $2.75@2.50; Burbank, d.-h. $3.75@3.00; do. bulk, $2 75@3 00, Snowflake, $2.75@3.00; do. d.-h. $2 12@2 87, peachblow do. $3@3.25; Peerless, $2,25@2.37; sweet Del. $1.50@2.75.

Southern truck is losing its cold-weather firmness in price; supplies will increase and dealers must not allow stock to die on the market.

Florida green peas per crate $1@2.50; Savannah do. $1@4; Charleston do. $3.50@4; Florida tomatoes, $3 25@3.00 ₱ crate; Bermuda do. 5-qt boxes, 75@$1; Fla. string beans, $1.50@2 ₱ crate; Bermuda beets $2@2.50 ₱ crate; do. onions, $1.75@2 ₱ crate; Norfolk Spinach, $1 25@2 ₱ bbl.; do. kale, $75c @1.25; do. radishes, 75@1.75 ₱ 100 bunches; Chas. asparagus $5@7 ₱ doz.; Fla. cabbage, $3@4 ₱ 100; lettuce, $2.50@4.50 per bbl.; cabbage, old crop ₱ 100 $4@8. Hubbard squash, $1.25@1.50 ₱ bbl. marrow do. $1.25@1 50; onions white, $3@4.50 ₱ bbl.; other in bulk, $2.50@3.25; carrots, $1@1.75; celery $1.50@2. Hot-house mushrooms $1 ₱ lb.; lettuce 25@37c. ₱ doz.; radishes $2@3 ₱ 100 bunches; rhubarb, $4@3 do.; cucumbers $1@4 ₱ doz.

WOOL.—Trade continues slack with not much prospect of an improvement expected until the new clips appear. Buyers still have the advantage. Quotations are for

Ohio, Penn. and W. Va. XXX and picklock, 43@45c.; XX, 40@42½c.; X, 40@41c.; No. 1, 45@46c.; No. 2, 38@40c.; common, 31@35c.; fine delaine, 43@45c.; medium combing and delaine, 45@47c.

Mich., Ind. and Wis. X and XX, 37@39c.; No. 1, 42@44c.; No. 2 and common 32@37c.; fine delaine, 42@43c.; medium combing and delaine, 44@46c.

N. Y. State, N. H. and Vt. X and XX, 35@36; No. 1, 40@43; No. 2 and common, 32@36c.; fine delaine, 39@42c.; medium combing and delaine, 43@45c.

Iowa, Ill., and Western X and XX, 34@36c.; No. 1, 40@42c.; No. 2 and common, 32@35c.; combing, 40@43c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, April 23, 1881.

BEEVES.—Receipts for the week 12 818 head; do. last week 11,573 do. Cattle continue to make good average, but the weather is turning against the drover and buyers will be apt to bend things their way if supplies hold out heavy. Some rough oxen and poor steers sold at 3¾@4¼c. to dress 55@56 lbs.; bulk of sales, ordinary to really prime steers, 9¼c. to dress 50 lbs. and 11¼c. to dress 57 lbs.

COWS AND CALVES.—The Spring demand has opened. A nice, fresh cow will bring $60, and if of fancy points $65@70 can be made. The range for fair to prime is $30@60, which is $5@10 better than the beginning of the week.

VEAL CALVES.—This market has suffered one of the heavy declines incident to heavy supplies of Spring, and until the glut is over prices will tend low, especially for dressed.

Live choice 1e 6¾c; fair to prime 5@6c.; poor 3½@4½c.; Mt. Holly, 4@7¾c; buttermilk 3@3½c; hog dressed calves extra 8¼@9c.; fair to prime 6@8c.; poor 4@5c.

SHEEP AND LAMBS.—Receipts for week, 27,462 head; do. last week 19,141 do. Market dull and tending lower; about one-half of yesterday's offering was carried over. Unshorn sheep quoted $6.25@7.15; clipped $5.20@5.50. Yearling lambs $6.75@7.50. Spring lambs State and N. J. $3@6.50 ₱ head; Va. 10c. ₱ lb.

SWINE.—Receipts for the week, 19,703 head; do. last week 19,334 do. Good quality hogs active at the extreme.

Live corn fed $6@6.50 per 100 lbs.; country dressed pork light, 8¼@8¾c.; medium, 8¼@8¾c.; heavy, 8@8¼c.; city dressed Western, 8¼c.

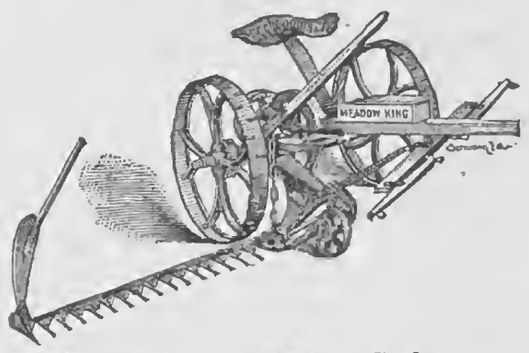
RALSTON'S
KNICKERBOCKER
RAW BONE
PHOSPHATE and DISSOLVED BONE. Composed of Raw Bone, Flesh, Blood, Acid and Potash. Prompt action combined with lasting effects Highest possible degree of excellence attainable. Applicable to all crops and every variety of soil. Guaranteed analysis on every package. Shipments made direct from the Western factory and DELIVERED at ALL principal railroad depots at LESS than WHOLESALE prices in New York.
☞ Special Fertilizers for Corn and Potatoes.
☞ Liberal Terms to Active, Responsible Dealers.
☞ Highest Cash Prices paid for Raw Bones.
Address JOHN RALSTON,
170 Front St., N. Y.

IMPROVED CALIFORNIA
WIND MILL.

Simple, Strong, Durable, Rosette Wheel and perfectly Self-regulating, avoiding 100 wearing joints. Also, Steven's Pony Feed Grinder and a perfect Rotary Motion attachment, without gearing, the power being communicated by the lift or up stroke of Pump Rod. Can be used for cutting feed, churning, &c. The best, cheapest and most useful power in the market. Full particulars, circulars, &c., sent free. Address the Manufacturers. CLARK & CO., SOMANAUK, ILL.

MEADOW KING



Mowing Machine.

In all that goes to make up a Mowing Machine, the MEADOW KING has no equal. The simplest, strongest and most durable Mower in the world. No Side-Draft, no weight on the horse's neck. Send for Illustrated Circulars. Address
GREGG & CO., Sole Manufacturers,
Trumansburg, N. Y.
Also Manufacturers of Lawn Mowers, Plows, &c.

CHALLENGE WIND MILLS

Victorious at all fairs. Over 7,000 in actual use in every State and Territory of the U. S. It is a section wheel—has been made by the present Co. for ten years; in all that time not one has blown down without tower breaking—a record no other mill can show. We leave it to the public to determine their merits. Mills sent on 30 days' trial. Best Feed Mills, Corn Shellers, &c., &c. Catalogue free.
CHALLENGE MILL CO., Batavia, Ill.

LANDRETHS' GARDEN SEEDS

It is manifest that from GOOD SEEDS ONLY can Good Vegetables be obtained.
The character of LANDRETHS' SEEDS has been substantiated *beyond all question.*
They are the STANDARD for Quality.
Over 1500 acres in Garden Seed Crops under our own cultivation.
Ask your Storekeeper for them *in original sealed packages*, or drop us a postal card for prices and Catalogue.
Wholesale trade prices to dealers on application.

Reading for the Young.

FARMING FOR BOYS AND GIRLS—NO. 20.

HENRY STEWART.

Summer Fallows.

It would be a great mistake to suppose that books relating to the art of farming are new things. Some persons have made themselves merry over what they scornfully call "book farming," by which they mean farming by means of certain practices described in books. But these persons, who thus try to show their own peculiar wisdom, only prove their own ignorance, for books have been written about the art of farming for more than 300 years. These very farmers referred to grow clover and know its value and how they could not do without it, and yet it was by means of a book written by Walter Blythe about the year 1600 that the value of clover was first made known to English farmers. But there were even in those days silly farmers who scorned a book farmer, for clover came very slowly into use, and it was not until a second book was written, advocating its cultivation, by Sir Richard Weston, that it became a common farm crop. Richard Weston introduced the rotation of crops, and in his book explained its principles and described the practice.

Soon after, the benefits of draining wet land were made known in a book written by Samuel Hartlib, a friend of the great poet, Milton. Then followed a description of the feeding of sheep on green forage crops, which was published in a periodical devoted partly to agriculture, entitled Houghton's Collections on Husbandry and Trade, and this improved and valued practice was thus made known and became popular. After some other books on agriculture had appeared there came a most valuable one in 1731, entitled Horse-hoeing Husbandry, by Jethro Tull, who first made known the advantages of cultivating crops and of the Summer fallow.

This most especially concerns the subject we are now considering, and we need go no further in our reference to books on farming, and to book farmers, than to notice that the foolish people who joke about book farmers actually owe to them and their books everything of value that they now know and practice in their own farming. But for these men no doubt we might to-day be plowing with crooked sticks and growing our potatoes and corn among weeds and grass and on ground filled with water, and might have been as poor farmers and as poor people in every way as the poor Indians we think so much beneath us. But we want now to learn what Jethro Tull knew about summer fallows and what advantage they are to us in these later days, when we think we know so much more than our fathers and grandfathers did.

What is a summer fallow? It is the constant working of the soil during the whole summer season; plowing, harrowing and cultivating it, but without sowing any seed and without growing any crop upon it. For what purpose? For the improvement of the soil, by killing weeds and by adding to its fertility. We have learned that the particles of the soil are dissolved by exposure to air and to water, and we know that weeds rob the crop of food that it requires, and so prevent its full and profitable growth. And so in the working of a summer fallow the soil is turned and broken up so that the rains and dews can moisten it thoroughly and the air can penetrate it and the surface of each little particle becomes dissolved in the water held in the soil, and thus a new supply of plant food is provided and stored up for the next crop. Besides this, a vast number of seeds of weeds are made to sprout and grow, and are killed as fast as they appear, and so the soil is cleaned as well as made rich.

But wise persons live and learn, and we have learned a good deal in the past few years, since books and papers relating to farming have become abundant; and also since there have been more book-farmers or reading farmers For we have learned that it is a waste of time to work the bare ground which lies idle and produces nothing, when we can just as well grow a crop and gain all the advantages of the summer fallow. And so we plant the field that we wish to clean and enrich, with beans, or peas, or potatoes, or corn, and work these crops thoroughly with the cultivator, and the hoe, if need be, and kill every weed and stir the soil and gain all the benefits possible from these labors, and produce a crop besides. It was a part of the old system to spread manure on the bare fallow and work it into the soil by the repeated plowings and harrowings; in the new system we prepare the ground for future crops but secure that which we call the fallow or cultivated crop.

THE SEED DISTRIBUTION.

Our fourth annual offering of seeds to the members of the Horticultural Club was announced last week, and now a word on their cultivation.

The Japan Judas Tree or Red Bud, as the American Judas Tree is called, is attractive at all times during the season, but the rosy tinge of the small red buds among the shining leaves make it doubly beautiful in Spring. It rarely bears fruit and seeds in this climate, but the specimens on the Rural Grounds bore sufficiently the past year to enable us to send some seeds to the young folks. It was desired to place these in the regular Seed Distribution, but enough seed could not be procured, so the Cousins are to be congratulated on their good fortune.

The seeds should be sown in pots—about three seeds in each—as soon as received, and the pots should be put in the ground and covered with glass. See that they have good drainage and keep the soil moist. When four leaves have formed, remove the plants carefully and cover for the Winter. The seeds are slow to germinate, but patience in waiting will be amply repaid. I would thank the Cousins for leaves and flowers of the Red Bud, as any change in form may prove of value to those interested in its culture. The Judas Tree is classed on the lawn with medium sized, slow-growing shrubs; the leaves are sessile, *i. e.*, rest directly on the stem, and, as the pods suggest, it is a member of the pea family.

The Crimson Dwarf Celery is an excellent variety. The seed should be sown in light, rich soil in April or early May. Sow in rows about ten inches apart and about half an inch deep, and press them down to prevent drying up. Keep the young plants clear of weeds and in July they may be transplanted to rows four or five feet apart, and six inches apart in the row. The rows or trenches should be about eight inches deep. Two or three months after transplanting they may be earthed up in order to be well blanched before storing for the Winter.

Now, then, members of the Horticultural Club, there is a chance for you to compete with your parents, and I have no doubt but that you will surprise them with your successful attempts at gardening, and Uncle Mark for one hopes that this year may be the beginning of a happy horticultural career to many of the Cousins. We make no charge for postage, simply asking you to report the success you have in the work.

We have received from Commissioner Le Duc some packets of seed of the Pyrethrum Roseum or Persian Insect Powder. It has been much sought after and is raised in but one place in the United States, and the firm declines to furnish any one with seeds and plants, the object being to make a fortune out of it. Now if any of the Cousins wish to try to cultivate this plant and will use great care in doing so, I will send them free of postage and on their application, a small packet of this valuable seed, in so far as our limited quantity will permit me to do so. I hope none will apply who have not the facilities for giving these seeds good care and cultivation as I wish a good report from each one who receives the seed.

Uncle Mark.

Dyspepsia, Biliousness, Nervousness and miserableness all cured with Hop Bitters.

THE "YOUNG QUERIST."

M. F., Durand, Ill., asks if E. G. Rideout, of New York, is trustworthy.

Ans.—We believe he is.

W. S. B, Lime Hill, Pa., asks. 1, how to graft roses, and 2, how to propagate them from cuttings.

Ans.—The wood of the rose being, by nature, pithy, grafting is somewhat uncertain. The methods used are similar to those in tree-grafting, as illustrated in the Rural of Feb. 12. For cleft-grafting, the stock is cut off, with a sharp knife, just above a bud, so that the bud may help draw the sap up to the clon The stock can be split with a knife, making the cleft about an inch in length. The clon should be about four inches long. Make the lower part of the clon wedge shaped, and insert it, being careful to fit the bark of the clon and stock exactly. Bind the stock and clon with a strip of cloth covered with beeswax and resin in equal parts and a little tallow to make it pliable. The clon will unite in two or three weeks. Whip-grafting and rind-grafting are other methods, but cleft-grafting is the surest for new beginners. 2. Cuttings should be made in the Fall or early Winter. They should be about six inches long and of wood of the season's growth. Cut the lower end square, close to a bud, then put them in dry sand in the cellar. A callus will form on this end during the Winter, and when planted in the Spring, roots will at once shoot out Plant early in Spring in light, sandy loam, with at least one bud above ground. Tread down the earth about them and water if the season is dry. Cuttings can be made in Spring, but they are not as sure to grow.

A. L. P., Milan, N. H., wishes to know, 1, if the crab-apple called Briar's Sweet is a Winter apple, and 2, if Whitney's No. 20 is a good apple.

Ans.—We have never heard of Briar's Sweet Crab, and if there is such an one it must be of recent introduction. Can any of the cousins answer the question? 2. Whitney's No. 20 is a handsome and very good fruit; quite as good to eat out of the hand as to make preserves of.

LETTERS FROM THE COUSINS.

Dear Uncle Mark:—I like very much to read the children's letters in the Rural and would like to join the Club. I have several pets, but the greatest pet of all is a very large hen. When she was a very little chick, last Spring, her mamma died, and we had to put the little chick in a basket of cotton to keep her warm. We call her "Peep." She would fly upon our shoulders or heads to roost and would try to pick the food from our forks when we were eating. She likes to stay with us better than with the chickens. She comes to the house every day to lay her eggs. I like to go with my brother hunting after rabbits and squirrels, but when he goes for deer I stay at home. He shot at a young mountain lion last Summer. He thought it a large wildcat. It might have attacked him if he had not been high on the rocks above. He hit it, for he made the fur fly, but it only hissed at him and ran. I have a little garden every Summer and I like to work on it very much, but I like the flowers most. We have no schools here, so we have to study at home. We have a piano and mamma is going to teach me music.

Deer Valley, Park Co., Col. Alice Taylor.

Dear Uncle Mark:—I am so glad papa is sending his renewal. We can't do without the Rural for we like to read the letters from the cousins so much. Our flowers did well last year, and our Surprise Melons were so nice. We had some seed of Wax Ball, we call it, to send you, so you could raise some and tell us the right name, but the mice got them. It is a hardy shrub and has bunches of white balls which are so pretty in the Fall. It has been so dreadful cold this Winter we could hardly save our flowers from freezing. Our geraniums all froze but four. We thought our fuchsias were all dead, but now we see they are all putting forth their little leaves again. We have twenty fuchsias, geraniums, lantannas, etc. We think we will not loose any more with proper care. We had a salvia come up in one of our pots last February. It commenced to bloom the last of May and it was in constant flower until the middle of December. It was growing nicely until the night of December 27, which was too cold for it. We have another now about two inches high. We don't know whether we can save it or not.

From your little nieces,

Lizzie, Barbara and Eliza Pound.

Wilsonville, Spencer Co., Ky.

Dear Uncle Mark:—If you will let me I would like to join the Club and become one of the "cousins." My home is in Vermont, which is called the Green Mountain State, on account of its long range of green mountains. It is a very beautiful State, and it is said by people who have traveled a great deal that the scenery of this State is among the finest in the world. We have had a very cold Winter, but I expect we have not suffered with the cold weather as much as the people in the Western States, as we are more accustomed to the cold and are better prepared for it. My mother has taken the Rural New-Yorker a long time and we like it very much. I am very fond of flowers, and we have some beautiful plants. Mother had some pretty ones sent her from the Experimental Grounds, but some of the names were so twisted that we could not pronounce them, so we called them Rurals. Sadie.

Randolph, Vermont.

Dear Uncle Mark—We all look for the Rural as for a dear friend. We tease mamma or papa until they read the cousins' letters to us. We are two little girls, aged eight and five years. We have two little brothers. Clarence is three years and Georgie is three months old. We wonder where you get the seeds which you send to the cousins. Mamma says she don't know whether you have lots of house-plants or not, but we think you have. Mamma has some nice ones. The Rural flower seeds did not grow, but the garden seeds did well. We like to work in the garden, and are to have plots of our own next season. I (Millie) commenced to help mamma when two years old. She set a bed of onions and I followed, gathering them up in my apron. We would like to have this put in the Rural so we can hear it read.

Mildred and Kate Jack.

Rockland, Venango Co., Pa.

Dear Uncle Mark:—We have taken your paper for about two years and like it ever so much. I have always read the letters from the cousins, and have wanted to join the Club. I have one sister, named Edna, ten years old, and a little brother, Oscar, nearly two years old. We have no flowers now, except chrysanthemums, mignonettes, and a few pinks, but in the Summer we have a good many flowers. We sent and got seeds of John Saul last year. The seeds we received from the Rural did not grow. Papa raised a Mangold Wurtzel that weighed 13 pounds, but he was not trying for the premium. I am afraid this will reach the waste basket, so I will close. Your true niece,

Woodland, Yolo Co., Cal. Adella Fisher.

A NATIONAL BLESSING.

(From the Philadelphia Record.)

The nineteenth century above all other ages has been noted for its many inventions; it has given us the steam power in its thousand-fold applications, the Telegraph, the Telephone, the Electric light, and innumerable other discoveries, all blessings to humanity; each day bringing us new surprises, until we have become so accustomed to the exhibitions of the genius of our century that any new development is at once received as a matter of natural consequence, and most people will simply remark, "I told you so." As an instance of this fact, we would only call attention to that wonderful discovery St. Jacobs Oil. A few years ago this great German remedy had never been heard of in this country; to-day you can hardly find a man, woman or child in the United States who has not used the remedy for some pain or ache, or at least has witnessed its use and seen its wonderful effects on a fellow being. St. Jacobs Oil has become a national remedy, for it is known in every city, town, village and hamlet in the country. It is a cosmopolitan preparation, for it is praised by the Americans, Germans, Italians, Bohemians, Danes, Swedes, Portuguese, Spanish, French, yes, even by the "Heathen Chinee." It may be termed the universal blessing, for it is indorsed by the rich and poor, the clergyman and the physician, the merchant and the laborer, in fact by all classes of the community. St. Jacobs Oil, by its almost marvelous properties, can be employed for a simple cut or sprain, or the worst case of inflammatory rheumatism. Persons who have been confined to their bed for years with that terrible disease, rheumatism, have been completely cured by the use of a single bottle. Such cases have been quoted by the leading journals of our country. For instance, the St. Louis Post-Dispatch says: Under the title of "Old Probabilities," one of the most useful and valuable officers of the U. S. Government, is most widely known. But quite as well known is Prof. J. H. Tice, the meteorologist of the Mississippi Valley, whose contributions to his favorite study have given him an almost national reputation. On a recent tour through the Northwest, the Professor had a narrow escape from the serious consequences of a sudden and very dangerous illness, the particulars of which he thus refers to: The day after concluding my course of lectures at Burlington, Iowa, on the 21st December last, I was seized with a sudden attack of neuralgia in the chest, giving me the most excruciating pain and almost preventing breathing. My pulse, usually 80, fell to 35; intense nausea of the stomach succeeded, and a cold, clammy sweat covered my entire body. The attending physician could do nothing to relieve me; after suffering for three hours, I thought,—as I had been using St. Jacobs Oil with good effect for rheumatic pains,—I would try it. I saturated a piece of flannel large enough to cover my chest, with the Oil, and applied it. The relief was almost instantaneous. In one hour I was entirely free from pain, and would have taken the train to fill an appointment that night in a neighboring town had my friends not dissuaded me. As it was, I took the night train for my home, St. Louis, and have not been troubled since. The Boston Globe says: Chas. S. Strickland, Esq, Builder, No. 9 Boylston Street and 106 Harrison Avenue, Boston, thus speaks: The pleasure which I hereby attempt to express, can only be half conveyed by words. Physicians of very high character and notoriety have heretofore declared my rheumatism incurable. Specifics, almost numberless, have failed to cure or even alleviate the intensity of the pain, which has frequently confined me to my room for three months at a time. One week ago I was seized with an attack of acute rheumatism of the knee. In a few hours the entire knee joint became swollen to enormous proportions and walking rendered impossible. Nothing remained for me, and I intended to resign myself, as best I might, to another month's agonies. By chance, I learned of the wonderful curative properties of St. Jacobs Oil. I clutched it as a straw, and in a few hours was free from pain in knee, arm and shoulder. As before stated, I cannot find words to convey my praise and gratitude to the discoverer of this king of rheumatism. The Chicago Times says: Everybody on the South side knows J. D. L. Harvey, Esq., who has been a resident of Chicago for over twenty years. Mr. Harvey expressed himself on the "oil subject" as follows: "I have spent over $2,000 to cure my wife of rheumatism. Two bottles of St. Jacobs Oil accomplished what all the medical treatment failed to bring about. I regard it as a greater discovery than electricity. It is a boon to the human race, and I am very glad to have this opportunity of testifying to its remarkable efficacy. I cannot speak too highly of it, and I would be recreant to my duty to those afflicted, did I not lift my voice in its praise."—The Philadelphia Ledger says: Mr. George I. Graham, 820 Nineteenth street, Philadelphia, is a journalist of many years' experience, and is actively connected with the Philadelphia Sunday Mirror, a leading theatrical and musical journal. During the "late unpleasantness" Mr. Graham was Captain of Company K., One Hundred and Eighty-third Pennsylvania Regiment, and through exposure in the field he contracted a variety of ills, and he says a very troublesome case of rheumatism in the right leg and foot was a war inheritance that he had in vain tried to get rid of, until he was recommended to try "St. Jacobs Oil." He states that he felt a slight relief even on the first application of the Oil. Before the first bottle he purchased had been used up he had but few traces of his rheumatism, and at this time he says the disease has entirely left him, which he attributes entirely to the use of St. Jacobs Oil. He remarks: "No person need suffer with rheumatism if St. Jacobs Oil can be obtained; to those who are afflicted with that complaint it is worth its weight in gold."—The Chicago Inter Ocean says: Capt. Paul Boynton, the world renowned swimmer, thus speaks of the Old German Remedy: "From constant exposure I am somewhat subject to rheumatic pains, and nothing would ever benefit me, until I got hold of this Old German Remedy. Why, on my travels I have met people who had been suffering with rheumatism for years; by my advice they tried the Oil, and it cured them. I would sooner do without food for days than to be without this remedy for one hour. In fact I would not attempt a trip without St. Jacobs Oil as I do not see how I could get along without it. St. Jacobs Oil has been endorsed by persons of national reputation; who would not lend their names if they were not convinced that it was a duty they owed to suffering humanity; they have experienced the wonderful effect of the great German remedy and they want their fellow creatures to know the result. We would only mention in this connection the Rt. Rev. Bishop Gilmour, Cleveland, Ohio: Excellent for rheumatism and kindred diseases. It has benefited me greatly—Mme. Marie Salvotti, Prima Donna Wilhelmj Concert Troupe: "Nothing can compare with it as a prompt, reliable cure for the ailments named."—Wm. H. Wareing, Esq., Asst. General Superintendent, New York Post Office: Proved all that is claimed for the Oil and found efficacious. Ready relief for rheumatic complaints."—Hon. Thos. L. James, Postmaster, New York: Referring to Superintendent Wareing's report concerning St. Jacob's Oil; "I concur."—Prof. C. O. Duplessis, Manager Chicago Gymnasium, Chicago, Ill.: "Our professionals and amateurs use it in preference to everything they have ever tried."—Major T. A. Hilliler, No. 2235 Master street, Philadelphia, suffered so with rheumatism that he was confined to his bed for weeks at a time, absolutely helpless, happened to hear of St. Jacob's Oil, tried it and was cured.—Geo. W. Walling, Esq, Supt. Police, New York City: "Member of this Department relieved of rheumatism by its use."—Stacey Hill, Esq., Mt. Auburn Inclined Plane Railroad, Cincinnati, Ohio: Undoubtedly it is a remarkable medicine."—D B. Cooke, Esq., American Express Co., Chicago, Ill.: "Gladly bear testimony to its efficacy."—Capt. Henry M. Holzworth, Chief Detective Force, Cleveland, Ohio.: "Surprising relief. A world of good."—Prof. Edward Holst, Pianist and composer, Chicago, Ill.: "Its effects are in harmony with its claims."..In conclusion we would say, that it is the imperative duty of every family to have a bottle of St. Jacob's Oil on hand for all emergencies; for the remedy is a true friend in need, and the occasion for its immediate use may come when it is least expected. Follow this advice, and it will not be long before you will join us in calling St. Jacobs Oil a National Blessing

PERSONAL ITEMS.

One son of Mr. Eoglish, the late candidate for the Vice-Presidency, married a pretty variety actress, and a second is betrothed to Minnie Kent, a skip-rope dancer.

All the inmates of the Soldiers' Home near Washington have signed a formal invitation and presented it to President Garfield asking him to make that place his summer residence.

The average age of members of the Garfield Cabinet is fifty-one. Mr. Gladstone's Cabinet averages fifty-eight. The youngest Cabinet Minister in America is thirty-seven, the oldest sixty-eight. There are two septuagenarians in the English Cabinet, but the majority are between fifty and seventy.

[Springfield (Mass.) Republican.]

Edgar T. Page, Esq., Druggist, writes us from Chicopee Falls, that Mr. Albert Guenther, under Wilds Hotel has used that remarkable remedy, St. Jacobs Oil, for a severe case of rheumatism and it cured him, as if by magic. He also used it with great success among his horses, in cases of sprains, sores etc., and it cures every time.

Sour stomach.

If the food taken into the stomach is not digested it decomposes. In the latter case a pungent gas is developed which causes sour eructations, or else the stomach itself secretes an acid, which, rising upward at intervals stinging the gullet sharply. These extremely disagreeable sensations are attributable to impaired digestion. To get rid of them, or prevent their recurrence, it is only necessary to tone and regulate the gastric organs with Hostetter's Bitters. It will not answer to postpone the great corrective with the idea that the unpleasant symptoms will disappear of themselves. So far from that being the case, they almost invariably culminate, if neglected, in chronic dyspepsia, with its concomitants of gnawing in the stomach, dizziness, perverted vision, headache and sleeplessness. It is true that all these disagreeables may be obviated by a course of the Bitters; but how much wiser to anticipate their arrival with one or two doses of that sure preventive of indigestion and strengthener of the alimentary organs.

COLUMBIA BICYCLE.

Bicycle riding is an accomplishment easily acquired, and is rapidly becoming the most popular of out-door sports; as a health restorative it is invaluable, bringing into action every muscle of the body, strengthening the lungs, and invigorating the wearied brain. The practicability of the machine is generally conceded throughout the country, and the thousands of bicycles in daily use are constantly increasing in number. Send 3c. stamp for catalogue, with price list and full information. THE POPE M'F'G CO.,

HENDERSON'S
HANDBOOK OF PLANTS.
BY
PETER HENDERSON.

This new work is a concise yet comprehensive Dictionary of Plants—embracing the botanical name, derivation, and the Linnæan and natural orders of all the leading genera of ornamental and useful plants up to the present time, together with all important species and varieties, with brief instructions for propagation and culture; and on nearly all important plants, such as the Rose in Flowers, Strawberry in Fruits, and Mushroom in Vegetables, instructions have been given at length, which are a plain relation of the methods in use in our own extensive business.

Henderson's Handbook of Plants is a large volume of 400 pages, handsomely bound in cloth, and will be mailed on receipt of $3.00.

Field Crops.

SORGHUM SUGAR-CANES.

I. A. HEDGES.

THE Chinese Sorghum, (Fig. 233), was first introduced from China into France and reproduced there; and from there it was brought into this country. The Imphee, or African, was introduced into France from Kaffraria by L. Wray, of London. It was reproduced near Toulouse on the farm of Count De Bouregard and imported here by Mr. Wray at the solicitation of the late Horace Greely, reaching here in May 1857. He brought 15 varieties varying greatly in appearance, that is, in the seed heads, as his was all in the head. I had the pleasure of witnessing the opening of his boxes and hearing him describe the various kinds as he held up one after the other. It is probable I am the only one left of those who heard his interesting history, which so impressed my mind that it still remains as clear as ever.

Now it is from these two sources that our multitudinous named canes come. It is possible that some fresh importations have been made from France; but I doubt it, because very little attention was given to the culture of the canes there—a fact I learned in a correspondence with M. Vilmorin, Andrieux & Co., of Paris, in 1863. The Chinese has held its own characteristic quality well. Its two great faults are a liability to fall before the wind, and, next, its inferiority as a sugar producer as compared with some of the Imphees, especially with hybrids of the Oom-see-a-na and Nee-a-za-na. These two appear to me to have produced the present valuable canes called Early Orange and Kansas Orange. The Oom-see-a-na at first attracted attention upon the farm of Mr. Hooker, of Schuyler Co., Ill., where an excellent sugar was made in a simple, rude box pan. The Nee-a-za-na is generally called White Imphee, and by some White Liberian, both misnamed and calculated to mislead.

I have never heard of any sorghum cane having been imported from Liberia. The term Liberian was doubtless applied to the variety to which it belongs either for speculative purposes or from an inability to remember its Kaffir name, which is Boom-viva-na. These native names are so difficult not only to remember but to pronounce that it is not strange that others have been substituted. The Liberian, so-called, is a late hardy cane and one that seldom falls before the wind. I have dropped it from favor because it is not a good sugar-producing plant, and because it is so late as to be liable to suffer from frost. It was a great favorite in Southern Illinois until last season, when Mr. J. S. Cross, of Randolph County, put in some of the Orange, and now this variety is greatly preferred.

The Honduras, so-called, is another misnomer. It is one of Wray's Imphees, Vim-vis-chu-a-pa, the largest and latest of all the family of African canes. I look upon it as a doubtful cane to handle. The seed is so much like that of broom corn—as may be seen from the illustration—that I greatly suspect it has been crossed to some extent. I distributed it with samples of Early Orange and Early Amber last season among several agricultural colleges and prominent cultivators in various latitudes with a request to have the samples tested side by side, and in every instance the Orange has far excelled. In Texas, Louisiana, Tennessee, Illinois, Missouri, Iowa, and Minnesota it has been quite satisfactory. It is called Orange because of its appearance; both the seed tufts and the ripe cane stalks are orange-colored and so also are the sirup and the raw sugar. It is not at all like any variety mentioned in Wray's descriptive catalogue. When I saw it first — a single tuft sent to the first meeting of the Mississippi Valley Cane-Growers' Association—I was struck with its beauty and its resemblance to what I thought was a cross of two valuable canes, and after two years' test of its qualities I am satisfied that my conjecture was well founded. It does not follow, however, that this is the *ne-plus-ultra* of cane improvement. If our cultivators will carefully cultivate and watch the developments consequent upon so vast a country and such a great variety of soils and climate as well as kinds of cane, and report the results of their observations to our Association, we shall make still further discoveries.

Mr. John Bartlett, of Oshawa, Canada, advises me that he has saved from a field of cane some few tufts that had superior qualities. He is sending them to me for inspection. I shall despatch them far down South for early planting in order to get a second crop from the same this season. He informed me that it was still earlier than the Amber and richer in saccharine matter. In like manner I have a seed tuft and samples of sugar and sirup sent from Mr. Kullum, of Petrie, Kansas, that give great promise of excellence. I have in a previous letter, I believe, expressed hopes that our State Legislature would do something to forward our efforts in an educational way by teaching the students of the Agricultural College farm, but I am sorry to say I am disappointed.

St. Louis, Mo.

HONDURAS CANE—Fig. 230.—See also page 308.

TOBACCO CULTURE.—NO. 9.

G. A. GOFF, JR.

Taking Down Tobacco.

As soon as the tobacco has become thoroughly cured in the curing barn it is ready for taking down. About three months are usually required for the tobacco to become perfectly cured—a condition which is known by the stems of the leaves having become free from their natural juices. Warm, damp weather is required to soften the tobacco so that it can be taken down from the poles. It is very important that the tobacco is in good condition as regards moisture, when it is taken down, otherwise artificial moistening or watering will be found necessary, which is not desirable, as it is costly and risky except when done by the most experienced of workmen. The leaves should be soft and pliable so that they may be doubled up in the hand without damage, or it is not in fit condition for taking down. When the tobacco is hung on poles with twine, as is the usual custom here, it is cut down from the poles and handed down in armfuls to a man who places the plants in a double "rank" with the butt ends extending outwards and the tips of the plants somewhat lapped together. When the other method of hanging is followed, the plants are slipped from the laths and handed down in armfuls or else passed down on the laths from which they are removed previous to being "ranked." After the stalks have been stripped of their leaves by small boys, the hooks are taken out and reserved for future use.

It is advisable for the tobacco grower to take down all the tobacco he can, if a good opportunity comes during the early part of Winter, for if the work is delayed and the opportunity passes, his tobacco may not become in fit condition for the work again until Spring, which will seriously delay him with other Spring work In the Winter several warm days are usually necessary to make the leaves soft and pliable so that the plants may be taken down. As soon as the work of taking down is completed the ranks should be carefully covered with boards or the like to prevent the tobacco from drying out. Great care should be taken in the different processes of manipulating a crop of tobacco to prevent it from drying. All the moisture that tobacco takes up from the atmosphere of itself while hanging up should be retained, and if this is done no artificial dampening will usually be necessary. To this end the prudent grower is always careful to keep his tobacco covered when exposed to a dry atmosphere..

Stripping.

The next process in the manipulation of a crop of tobacco is the stripping. This should be done as soon as possible after the tobacco has been removed from the poles, as delay in the work will endanger loss from the tobacco heating in the rank, caused by the fermentation of the stalk. This heating, however, in the pack does not usually occur except when the stalk is still green, as it is likely to be when taken down in the Fall or early Winter. The process of stripping consists in removing the leaves from the stalk. They are then tied up in small bundles weighing six or eight pounds each, and snugly packed away in a double rank, with the butt ends of the bundles extending outward and well covered to prevent drying. The stripping is usually done in the open shed, mild weather being chosen for the work. Sometimes, however, when the work is pressing, the tobacco is carried to the stripping and assorting room where there is a fire and where the work can be continued during cold weather.

When the tobacco is stripped it is ready for the assorting room, which has been described in a previous article. A considerable quantity of tobacco should be kept in the assorting room all the time, as it is essential to have it warm when it is assorted, as cold tobacco is always harsh and brittle.

Assorting Tobacco.

We now come to a part of tobacco work which requires more mind than muscle. Every tobacco grower who takes an interest in the business enjoys sorting tobacco. With a comfortable room provided with a good stove, the tobacco grower can sit at his bench and carry on the work during the most inclement weather of Winter. There is much to say relative to the necessity of assorting tobacco well. The work comes at a season

when the farmer is not pressed with other work, and hence, there is no good excuse for its being slighted. Neatness in the work is also an important factor and should not be overlooked.

The tobacco is assorted usually into four different qualities; sometimes six qualities are made as ordered by the purchaser of the crop. The customary four qualities are marked A. A., A, B. and C., according to grade, the A. A. meaning 1st wrappers, the single A. 2nd wrappers, the B. for binders and C. for fillers or "lugs," as they are sometimes termed. The work of assorting consists in placing a bunch of the tobacco upon the table or bench, loosening the string or band, and handling the leaves over one by one, and throwing them into their respective piles, each assortment by itself. The leaves are then tied in "hands" or "hanks" containing from 15 to 20 leaves each. Soft, narrow leaves are used for the "tiers" and are wrapped about the butt ends of the leaves forming the hand, the tip ends being tucked between the leaves of the hand, making a neatly-formed hank. Our most successful growers exercise great care in assorting their tobacco. The hands are made as nearly as possible of equal size, and are neatly tied with leaves suitable for the purpose. "Fat" or very inferior leaves should not be used for tying the hands. Tobacco assorted in a neat and workmanlike manner indicates care and painstaking on the part of the grower, which is recognized by the buyers and raises the reputation of the grower in their eyes. Tobacco before it is assorted should be in good condition as regards moisture, that is, the leaves must be soft and pliable, so that they will not be damaged by the handling necessary in performing the work well. It is also advisable in assorting to make the qualities *good*, that is, to make a good double A. and a good A wrapper; in other words, to put in a wrapper no leaves that do not absolutely belong there, leaving all poor and inferior leaves for the binders and fillers. Some growers endeavor to make too many wrappers, thinking thereby to get more for their crops, by making a large show of the higher grades. This is a mistaken method of assorting, and nearly always results unsatisfactorily. When six qualities are made in assorting, the A's and double A's are "sized," and the long and short leaves in each quality kept separate; they are then termed long A. A's. or short A. A's., etc. I have dwelt at considerable length on the subject of assorting tobacco, for the reason that there is no part of the growing and handling of a crop, that gives the grower so good an opportunity to build up a good reputation as the manner in which he "puts up" his crop. The growers in Lancaster County, Pa., and in the Connecticut Valley have built up a high reputation by the commendable manner in which they assort their crops. So with certain of our growers in the Chemung Valley, who have gained a favorable repntation among packers of the leaf, they owe their reputation to the care and painstaking which they exercise in assorting and packing their tobacco.

CORN CULTURE IN EASTERN OHIO.

With the farmers of this part of the country the corn crop is among the most important. In fact, I might say it takes precedence of all others. As the people are mostly engaged in mixed farming, the most prominent feature of which is wool-growing, this crop occupies a place as a food unsurpassed by anything else, and while there are but very few—mostly renters—that sell any, farmers generally calculate to raise enough for their own use. While it is no uncommon thing to see from 20 to 30 acres in corn on a single farm, the acreage is more frequently under than over that.

The general practice is to plow sod for corn. This is mostly the first plowing done in the Spring and is attended to as soon as the frost is ont of the ground; or, if the season is favorable, it is not an uncommon thing to see fields plowed in the Fall, and occasionally during the Winter months. It is a pretty generally accepted opinion that if the ground is frozen a few times after being plowed, the injury from cut-worms will not be so great the following season. Some do not plow until immediately before planting, and claim that owing to the fresh grass being then turned under there will be less danger from cut-worms than if the plowing is done at any other time; but there is danger of being caught by a dry spell about the last of April or first of May, and if the soil is limestone or heavy clay, one would have to wait for rain, which is a little risky.

When the season arrives for planting, the ground is harrowed and put in the best possible condition. Of course, a great many give it a "lick and a promise" and let it go; but this kind of carelessness is getting less frequent each succeeding year. The rows are run from three and one-half to four feet apart each way, or, if the ground is side-hill, it is common to plant closer and work but one way, and even on level ground it is not an uncommon thing of late years to see fields drilled either by hand or by a planter. There are not as many planters need as might be supposed for an old-settled part of the country, but they are coming into use more of late years. For running out the ground to plant some use a marker drawn by two horses, which makes three rows at a time; others use a one-horse bar shear plow, and only three or four years since I saw a man on a rented farm, who was putting in about 100 acres, furrowing it all with a one-horse plow, but this practice is a little too slow for this fast age, and will soon be entirely discontinued, except on very rough pieces of ground.

For cultivating, the one-horse cultivator and double-shovel plow are mostly used, but of late years a good many two-horse walking sulky shovel plows have been introduced, and an occasional riding sulky, but these are generally considered too expensive for the number of acres appropriated to this crop, and then we have considerable sidling and rough land in the counties bordering on the Ohio River. The hoe is not used in cultivating except to set up stalks. From two to three stalks are left in a hill. The yield per acre varies from 50 to 160 bushels of ears, and an occasional field gives more or less, as the case may be; but the most common yield is about 100 bushels, and as a general thing no manure or fertilizers are used, although an occasional field is manured in the hill.

It is a very rare thing to see a field of corn not cut off previous to husking, as the fodder is held in high esteem by all for feed for all kinds of stock. When it is cut off it is put in stooks of from 64 to 144 hills, the former being the rule and the latter the exception. At husking time it is tied into bunches containing from 40 to 60 stalks, of which from 10 to 20 are put together in stooks, where they are kept until feeding time, when they are hauled, as used, to the place of feeding. Of late years a good many have abandoned this plan, and as soon as husking is ended, the fodder is hauled to the barn and put in the mow or stacked out-of-doors convenient to the place where it is to be fed, and it is to be hoped the day is not far distant when, instead of this being the exception, it will be the rule. There are but very few that cut their fodder before feeding, and consequently it is about all fed out-of-doors on the ground. In preparing the grain to feed, some have it shelled and ground, but of late years mills for grinding corn and cob together have come into very general use, and the product is fed to horses, cattle, sheep and hogs. With sheep, however, a great many follow the old practice—feeding in the ear on the ground; while others shell and feed from troughs. As to kinds grown, they embrace all known sorts, but are mostly of the Yellow Dent variety. New varieties are tested from time to time, and, as is the case with everything else, any new sort has to make a very poor show indeed if it does not find a friend to advocate its merits, nor is it ever so good that there is not some one to point out its faults.

Jefferson Co., Ohio. M. N. Russell.

RAISING GOOD CROPS OF CORN WITHOUT HOEING.

I have always thought that hand hoeing in producing a crop of Indian corn absorbed such a large proportion of the profit that there was only a small revenue left as an equivalent for the money invested in the land and the cost of plowing and planting. Hence it has latterly been my practice to manage so as to prevent the expense incident to hand-hoeing as much as practicable. To save hand-hoeing, my practice is to defer plowing the ground until the time for planting has nearly arrived. The object is to plant as soon after the land is plowed as the work can be done. By adopting this practice the corn will come up quickly, get the start of weeds and grass, and with a very little work with hand hoes the growing crop will maintain the ascendency during the entire season. When land is plowed two or three weeks prior to planting, unless the culture has been unusually clean during previous years, grass and weeds will come up before the corn appears, thus necessitating a vast deal of expensive labor to weed the hills. Whatever may be the form of the plot of ground, if it is at all practicable, I commence plowing at the center and turn the furrow-slices all towards the center of the field. By this practice all middle furrows are avoided. Then, the ground is marked out in the modern quincunx order, or diamond fashion, so that any three hills at any part of the field standing nearest each other will each of them appear at a corner of an equilateral triangle. By this practice the horse-hoe can be run three ways as well as one way.

In order to mark out the ground in the modern quincunx order, the marks are made first one way, usually commencing on the longest side of the plot. After the ground is all marked out one way, if marks are made across the first marks at an angle of about sixty degrees, the hills will all stand diamond fashion, each hill at the corner of an equilateral triangle. Take three rails or poles or boards all of equal length (no matter how long if the three are of equal length); lay one pole in the first mark on one side of the field; then, place the ends of the other two poles or rails in contact with the first pole so as to form an equilateral triangle, somewhat like a three-square harrow, with one pole lying straight in one of the marks. The other two poles will indicate the direction for the cross marks. Three tall stakes can then be set up in a range with one of the poles as it lies on the ground, to guide in making the first cross-mark. The foregoing manner of determining the direction for making the cross marks, will be found about as accurate as it can be done with a surveyor's compass. By marking out the ground two ways, say three or four feet apart between rows, the rows will be three or four feet apart in three directions. Then, by starting the horse-hoe as soon as the growing corn is four or five inches high, and going through in three directions, one man or boy will be able to do all the hoeing, weeding and setting up the hills that are partially covered or bent over, as fast as another man can run the horse-hoe through one way. I prefer level cultivation.

Potatoes are planted in the same manner and the horse-hoe does more than eleven-twelfths of the hoeing. If the soil is generously seeded with noxious weeds, by running the horse-hoe three ways, when weeds are in the seed-leaf, or just out of it, almost every green thing, except the growing corn, will be covered up or rooted up. When weeds are small and tender they can be destroyed easily; but allow them to grow until they become rooted only medium deep, and they will cling to life with amazing persistence, especially if the soil is moist. Orange, N. J.

WHITE LIBERIAN CANE—SEE PAGE 308.—FIG. 231.

BARLEY vs OATS.

Farmers this year will probably sow barley rather than oats wherever barley has heretofore proven a profitable crop. In many places barley cannot be grown, as it is peculiarly liable to injury from excessive heat in Summer. The region in Canada north of Lake Ontario has long been famous for barley, and its product bears a higher price than that grown on this side of the line. But good barley is grown in cool, moist soils in Western New York, and when the season is favorable it is a paying crop. As moist, cool soil is important a top-dressing of salt is one of the best possible applications for barley. The salt should not be drilled with the seed, but sown after the barley has begun to come up. One barrel per acre, or about 300 pounds, costing one dollar, is the right quantity. It will make the barley straw bright and the berry plump and of full weight, an item of great importance, for thousands of bushels of light barley are thrown out as unsalable for malting, and fit only for feeding. Barley is one of the best fallow crops for preceding wheat. It can be harvested two to four weeks earlier than oats, and the longer preparation of the soil this secures is very important for the wheat plant. It is also believed that barley is less exhaustive of the soil than oats, but this is not certain. Barley stubble is usually much lighter than that of oats, and therefore after plowing the mechanical condition of the soil is much more favorable.

W. J. F.

Over-Estimates of Corn Yields.

Professor E. W. Stewart states in an article on corn which appeared some time ago in the Rural, that 100 bushels of corn per acre are an "easily possible crop." I think the Rural readers will agree with me in saying that not one man in a hundred, if he should take ten acres on his own farm, even with the most favorable conditions in every respect can raise 100 bushels of corn to the acre, counting 56 pounds to the bushel of corn containing not more than 11 per cent. of water. These immense yields, so frequently reported, are too often computed by going into the field early in the Fall, husking a half dozen hills or a row, estimating the amount of ground and measuring the corn in a basket, but it will shrink from ten to twenty per cent. afterward. The science of agriculture can never progress rapidly in the face of inaccuracy and wild statements.

I. P. Roberts.

Farm Economy.

MOISTURE WITH MANURE.

Everything is adulterated now-a-days, sometimes with much and again with but little damage. All chemical fertilizers are adulterated, some with earth to make bulk and freight charges, some with plaster to attract moisture and also to make bulk, upon the principle that this manufacturer can give you as much for your money as the next man.

The addition of plaster to the other ingredients of a good fertilizer is only a damage in so far as it increases the cost of hauling. Moisture is so vastly necessary to the profitable employment of all fertilizers, that if the manufacturers could, they would add water *quantum sufficit* to irrigate the land during the whole growing season, without depending upon the usual rainfall. Plaster absorbs moisture from the air more abundantly than any other known low-priced chemical substance, and hence its value as a fertilizer not only *per se*, but in combination; for besides its own exclusive effect upon the insoluble constituents of soils, it also furnishes some extra moisture which enables other solubles to act. Therefore phosphatic fertilizers are benefited by its

addition, but when manufacturers will put up the usual constituents of their fertilizers without any adulteration, leaving the farmer to add at home either common soil or plaster as he can obtain either the cheaper, the saving in freight will be so great that for every ton now used, there will be hundreds. Then the great Northwest will buy fertilizers and ruin the Eastern farmers in ten years.

There is no doubt that a good fertilizer upon a prairie soil, would from the quality of the land already, produce far more per acre than on the best Eastern lands, last longer and yield heavy returns.

It is supposed by some farmers that manure of any kind is not needed until land is exhausted; but that is a false conclusion. It is cheaper to keep good land up *to* a paying state of fertility, than to raise poor soil up to that point. Land is very much like live stock, in that respect—it doesn't pay to starve either. Now let the fertilizer manufacturers leave out their adulteration for mere bulk, induce railroad companies to put freight on such goods down to cost or even less, and they will have to transport ten times the grain to the seaboard. The railroads may give away dollars, but they will get back thousands in return.

S. RUFUS MASON.

THREE HORSES ABREAST.—A correspondent writing from Princeton, Ia., on this subject, says: "Put the odd horse in the middle, snap the inside line of each outside horse to the bit of the middle one. Now you have only to run a strap from the inside bit ring of each outside horse through the hame ring and turret of the middle horse and buckle it to the opposite line, and after it has been properly adjusted as to length, you can control each of the three horses as readily as if you were using only two. Never drive three horses abreast unless they are attached to a load or implement, as they are apt to swing out to one side and get "mixed up."

Pomological,

PEACH CULTURE.

C. M. HOVEY.

NOT long since a discussion took place before the Massachusetts Horticultural Society upon peach culture, and though very interesting, because it is a subject on which all lovers of good fruit desire information, yet, singular enough, not an idea was advanced among the many advocated, but what was quite as well, if not more distinctly, stated nearly a century ago. Indeed, so far as peach culture is concerned we have made but little advance, and even as regards the production of new kinds, as compared with other fruits, the improvement has been very slight. It is doubtful if we have many peaches superior or even equal to George the Fourth, Grosse Mignonne, Cooledge's Favorite, Noblesse, Old Mixon Free, Early York, Jacques and some others. Almost the only exceptions are Crawford's Early and Crawford's Late, and within a very few years some early sorts of fair quality, though remarkable for nothing but their earliness.

In fact, as to peach culture, it can hardly be said it is so well known as it was years ago, if we are to judge by our markets; for less than 25 years ago excellent peaches of home growth could not be sold for much more than what the hard, half-ripe, or else soft, half-rotten ones, which come in immense quantities from the South, bring to-day. No doubt much of this must be attributed to the mistaken idea that our climate has changed and the peach can no longer be relied upon for a crop. Singular as it may appear, the same idea was prevalent one hundred years ago. Yet peaches are plentiful and always will be, if trees are planted, notwithstanding the apparent adversity of the seasons. An authentic historian, Paul Dudley, F. R. S. and Chief Justice of Massachusetts, whose garden was in Roxbury (now Boston), writes in 1726 as follows: "I have had in my own garden seven or eight hundred fine peaches of the Rareripes growing at a time on one tree," and further, "Our peach trees are large and fruitful, and bear commonly in three Years from the Stone. I have one in my Garden of twelve years' growth, that measures two Foot and an Inch in Girt a yard from the Ground, which two years ago bore me near a bushel of fine peaches." Cannot we do, in these days, what the stern old Puritans did, overwhelmed as they were with the cares and labors of an unsettled colony and in an untried climate? If peach trees were so vigorous then why should they not be so now?

Judge Peters, one of the most intelligent agriculturists of Pennsylvania, was an extensive cultivator of peaches, and has given his experience in the Proceedings of the Massachusetts Society for the Promotion of Agriculture. But for the date—which is September 1807—we might have supposed it written in 1880. The same ill success, the same insects to contend with—the same diseases and similar other causes that were named at the discussion alluded to; and he tried all the same remedies and all the same appliances (and many more) which were tried by those who gave their experience, in 1881. The result was then as it is to-day—if the season or a succession of seasons was favorable there was an abundance of peaches; if unfavorable, then the reverse.

The peach is a native of a warmer climate than New England, and a much less variable one than any part of the Middle or Northern States; and when this is taken into consideration, there can be very little doubt why our crops of this fruit are not as constant as the apple or the pear. Acclimatization has never accomplished anything in this direction. Only through hybridization of a tender with a hardier species or variety has anything been done to give hardiness to a semi-tropical or half-hardy plant. All attempts through successive generations of seedlings of the Indian Rhododendron from the Himalayas or the Chinese Rose from Asia, failed, until our native R. Catawbiense was crossed with the former, and the hardy rose of Europe with the latter.

Mr. Richard Cooper, of N. J., an extensive cultivator of the peach and a close observer, who has put on record his experience with peaches in 1779, remarks, "I am confident that not more than one of my peach trees has been killed by worms for 20 that have died in consequence of irregular Winters; and as I have observed the fluctuating state of the weather in Winter constantly to increase for more than 50 years, I conceive it must proceed from some certain cause."

EARLY AMBER CANE.—FIG. 232.

CHINESE SORGO CANE.—FIG. 233.

Judge Peters then describes his experiments in peach culture under date of September, 1807: "Having cultivated it from my earliest youth, it would seem that I could give some certain and profitable mode of remedying its tendency to decay and repelling the diseases to which it is invariably a victim. But I have found myself so frequently baffled in my endeavors, and have seen the fallacy of so many theories on the subject that I diffidently affirm anything respecting its culture or care. * * * * * * About 50 years ago (1760), on the farm on which I now reside, my father had a large peach orchard which yielded abundantly. Until a general catastrophe befell it, plentiful crops had been for many years produced with little attention. The trees began nearly all at once to sicken and finally perished."

Precisely the same thing has been experienced over and over again since that early date. In our younger days peach trees (1830) were 20 feet high and 20 years old, tall and lanky, to be sure, but still healthy and bearing plenty of fruit. Then came the same general catastrophe which befell Judge Peters. From 1845 to 1856 we again had the same plentiful supply. But with the terrible cold of 1857 and 1861 the general catastrophe overtook them, and they are again recovering and producing as abundantly as ever.

But we now come to the point, which was the real object of my remarks, viz: to show that in 1800 the very same insects and diseases that we are combatting to-day were quite as common, and the panaceas for a remedy just the same as were detailed at the recent discussion, with no better results than will accrue from them, should the seasons be adverse.

Judge Peters, whose patience must have been as great as his enthusiasm was remarkable, writes as follows: "I have failed in many things in which others are said to have succeeded. Straw and bass, or paper surrounding the tree, from the root to all distances from six inches to three or four feet—White-washing, Painting, Urinous applications, Brine, Soot, Lime, Frames filled with Sand, Oil, Tar, Turpentine, Sulphuric acid, Oil of Vitriol, Nitrous mixtures and almost every kind of coating. I ruined several trees by cutting them down, and permitting the stump to throw up new shoots, and branch at pleasure. All teguments kept the exudation from evaporating with freedom. The pores being closed, or too open, were alike injurious. Tegnments of straw or bass made the bark tender; and it threw out under the covering sickly shoots. The more dense coating stopped the perspiration. The oil invited mice and other vermin, who ate the bark thus prepared for their repast, and killed the tree. I planted in hedge-rows, and near woods, I paved, raised hillocks of stone—I have suffered them to grow from the stone only, grafted on various stocks and budded, hilled up the earth in the Spring, and exposed the butt in the Fall, sometimes I have used the knife freely—frequently have left the tree to shoot in every direction. I have scrubbed the stocks or trunks with hard brushes, soapsuds and sand, scraped them with proper instruments: I have, for a season or two under various experiments amused myself with the persuasion, that I had discovered an infallible Panacea. I had temporary success but final disappointment."

Can we find men to day, with the honesty of Judge Peters? We doubt it. In the place of acknowledging "final disappointment" the very same processes of Mr. Peters are affirmed to be positive successes, altogether over-looking the fact that the success is owing to the season, and not in the least to the *quack nostrums* employed; and forthwith they publish their wonderful discovery to the world, to be taken up by novices, who look to nostrums for a cure, while they neglect Nature's remedy, to "let well enough alone," and kill their trees by downright doctoring, when they need nothing but mother earth, a little manuring, and good generous care. It is no wonder we do not make more progress when all our practice has been anything but rational. Peach culture may be summed up in a few words:—Good trees, good varieties, good soil, favorable position, moderate fertilizing, intelligent pruning, (if any at all), death to the borer; and if the seasons are propitious there will be abundant crops. One word more. Plant a tree or an orchard every year. Cut down and burn up as soon as the trees show signs of decay. Throw away the knife and rely only on fresh young trees which bear freely the second or third year, and saving the "irregular winters" which we always have had, and which we always shall have, and, we would add, cold, wet Summers when the wood does not ripen, the peach is quite as sure a crop as the pear. Criticize Paul Dudley's statement. He says, "two years ago" his tree bore nearly a bushel of peaches. Why did he not say last year? Undoubtedly for the very good reason, that the previous Winter was a hard one and he had no crop, thus accounting for off years as we do now.

Horticultural,

FARMERS AND SMALL FRUITS.

J. S. WOODWARD.

IN traveling about the country among the farmers I have often wondered why so few of them raised small fruits. Not one in five, on an average, tastes any kind of small fruit of his own growing from one year to another. Formerly a few currant bushes struggled with the grass and weeds in the fence corners and gave an abundance of small but wholesome fruit, but, with the worm as a foe, the bushes were unequal to the contest; the grass waves triumphantly over their dead remains, and the farmer is entirely without small fruit. Why this great scarcity? Certainly not because farmers do not love fine fruit. Ask any one of them into your plat, and you will be surprised to see what capacity he has for stowing a large quantity in a small space. Nor is it because he is too stingy, for he will send the boys and girls, and even go himself, miles away to a few straggling wild bushes to pick a few poor berries that cost him two or three times as much as it would to grow those much better on his own farm.

There are three reasons to which we can attribute this lack of small fruits on the farm:—First comes carelessness. The farmer sees the fruit in its prime and resolves to raise plenty for his family, but before planting time comes he has partially forgotten his good purpose and lets the proper season go by. Second, the mistaken notion that prevails as to the great labor and expense of growing what would be needed to supply his family. The last and best reason is that the farmer does not appreciate the value of the small fruits to his family, both as food and as medicine. When he looks at the early strawberry blushing and nodding amid the dew-laden leaves, and his mouth waters for a taste, he does not realize that nature is yearning within him for the acid contained in the fruit, to help relieve the system from the accumulations of Winter and prepare it to endure Summer's heat. He does not consider that each of the fruits in its season contains some principle that is just adapted to the wants of the body at that time, and that many times the free use of each would save large amounts in doctors' bills, as well as much suffering, and, many times, the life of a beloved one. The average American farmer is not yet educated up to the full enjoyment of his high calling and God-given privileges. He does not yet realize that he is near the fountain-head, and is entitled to partake first and of the best of everything that grows, and that when he neglects to provide himself and family with these health-giving necessaries he is culpably responsible for the bad results.

To correct these false impressions, and to cause him to provide and enjoy these, his rights as the tiller of the soil, would be conferring on himself and family a great and lasting benefit. One acre of good land, properly divided and cultivated, would furnish any ordinary farmer's family all the fruits, fresh and canned, needed from the earliest ripening of the strawberry to its coming again. To what other use could an acre of land be put that

would add so much to health, comfort and enjoyment? In planting, the farmer should not fall into the too common error of using small beds or plats here and there scattered about, but let the rows run the whole length, and so place them that the main cultivation can be done with a horse. This will save much hard work and valuable time in hoeing. Another fact he should remember: "The easiest cultivation is thorough cultivation"—no half-way business. It is much easier to keep the land entirely clean than to keep it half overrun with grass and weeds. He should remember this acre is worth two in corn or potatoes and give it good care, allowing nothing but fruit to grow. Of kinds, it should contain at least strawberries, raspberries (red and black), currants, blackberries and grapes.

In selecting varieties of each kind he should remember that the first requisite in the family is quantity. They would much prefer a quart of Wilson Strawberries to a half-dozen berries of any of the most exquisitely flavored that "ever graced the vine." He should not run after every novelty he sees advertised, but first content himself with those known to be fairly good and that will give plenty of fruit every time. On the other hand, he should not plant a fruit, however much it may bear, that, like the Champion Grape, is only "good to look at," and that even the birds will not eat. Let quantity be a first and quality a second consideration in selecting sorts. With a proper selection of varieties and division in quantity, and with good care, the acre should give him bushels and bushels of the best and most health-giving food the good God ever created for man's use, and if the capacity of his family should ever outgrow the ability of the acre to supply it, he should be only too glad to devote more land to this use, and when he is rejoicing in the abundance he will not regret the small amount of labor required, and should not forget to be thankful for the great blessing, or to share a portion with his less fortunate neighbor, and thus perchance he may induce him to "go and do likewise."

Thoughts on reading in "The Garden."

More than fifty years ago I read an old book, "Hervey's Meditations among the Tombs and among the Flowers." I was too young to admire the first part, but the second filled my mind with a first sense of the beauty and splendor of Nature, increasingly appreciated ever since. I used to take the book to the garden and read it there clinically. I remember well that I could not (then) see the force of the author's objections to the gaudiness of some of the brilliant flowers from warm climes. The old dispute over this goes on. The "Garden," a beautiful London periodical, exponent of all garden charms and lore, a delight to every horticulturist, continues to argue for the restoration of the soft-toned and fragrant flowers of former generations—the primroses, cowslips, violets, daffodils, daisies, forget-me-nots, etc., which have been pushed almost out of sight by their more splendid but later sisters. Few of these have fragrance, save the heliotrope. The vernal flowers seem to say, "Love on and linger"; the glowing strangers say, "Worship and go." And people do go, says the Garden. "The electric light is very beautiful but for a continuous object the softer light of the moon is preferable." A bit of glowing color here and there is very desirable, but there are so few who can deal with it in mass. "What a guy do some of these gaudy daubers make of Flora!" says a charming writer in the Garden.—S. R. H. No amount of beauty can stand a green bonnet with blue ribbons, a yellow body with a crimson skirt, black stockings and white shoes, mauve parasol and vermilion gloves! One is always safe with the old style of mixed border, or with a few good flowers in a corner. Nature sees to the harmonious arrangement and outline of her own. The green carpet of clipped grass is the one-half of the best lawn or house-yard. New arrangements of its floral edging can be made every season, if notes are made when the desirableness of some change becomes apparent. "W."

Soaking Asparagus Seed.

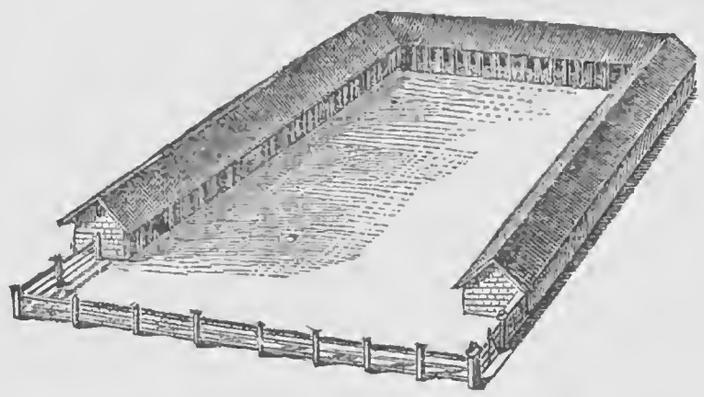
In reading the directions for treating the seeds of the RURAL'S Free Seed Distribution, I notice that soaking the asparagus seed is not mentioned; but my experience leads me to believe it to be of great advantage, whatever may be said of soaking seeds generally. Asparagus seed, on account of its hard, horny, outer coat, is very slow to germinate, and, as usually treated, often fails to germinate at all. It should be soaked in warm water for a week or ten days before sowing, or until the sprouts begin to show on the seeds. The dish containing the seed should be placed where it will keep warm (the top of the reservoir to a kitchen stove is a good place), and have the water changed several times. Treated thus, asparagus seed will "come up" as quickly as corn, and not only save weeding but add a month to the length of the growing season, which will make quite a difference in the size of the plants the first year. L. W. GOODELL.

Rural Architecture.

SHEEP BARN AND SHED.

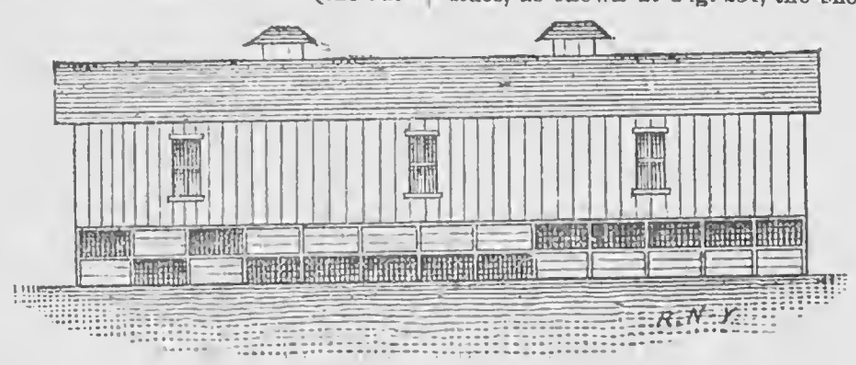
A VERY common mistake made by owners of sheep is to suppose that these animals will thrive without care or shelter. It is a common error to believe that sheep do not need water; that in Summer they manage to get a supply from the dew or rain on the grass, and that in the Winter they can lick the snow for drink. So, with regard to shelter, it is often supposed that with their woolen jackets they are proof against rains and storms and need only the lee side of a fence or the side of a barn (the outside) for shelter. This mistaken practice yearly causes enormous loss, for which the sheep are held responsible, and an idea becomes prevalent that these animals are weak and tender and that one always has bad luck with them. It is most true, on the other hand, that sheep will repay, as well as, if not better than, any other animal, all the reasonable care and attention that can be given to them, and that, for the money invested in them, they will return a larger profit than any other live stock. Shelter is the principal thing, and it is not shelter from rain and storms alone that is required by sheep; they need to be sheltered from exposure to damp, from foul air and from unwholesome sweating in confined, ill-ventilated pens and stables. In short, they require all the sanitary precautions which every thoughtful man knows to be necessary to health, both as regards lodging as well as feeding. Luxury and costly provisions in the sheds are not needed. The roughest hemlock board, a strip of bark, a wall wattled with straw or coarse hay or light poles—any of these will provide as good and comfortable shelter as a dressed and painted pine board.

A shed may be made by setting two rows of poles in the ground about 10 feet apart in the rows and the rows 16 feet apart. The front row may be eight feet high and the rear row five feet. A roof of poles and strips covered with thatch may be made and the ends and rear side filled in with coarse hay or straw,



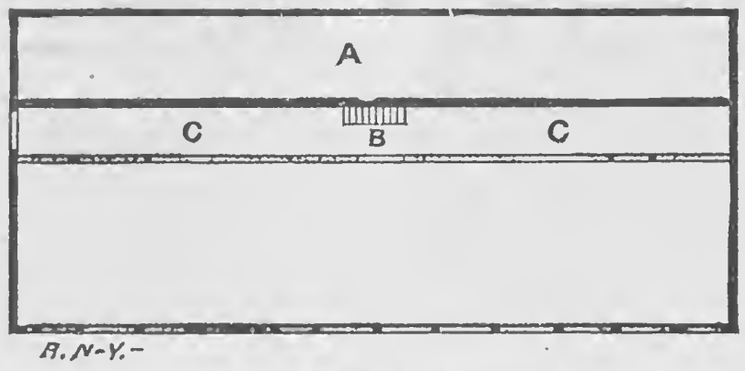
SHEEP SHED.—FIG. 234.

or even pine or hemlock brush, held between light strips nailed on both sides of the upright posts. For Western and Southern shepherds, this will make a serviceable shelter, and, being left open to the south, will afford protection against the prevalent storms. If the shed were continued on the east and west sides, as shown at Fig. 234, the shelter would



SHEEP BARN.—FIG. 235.

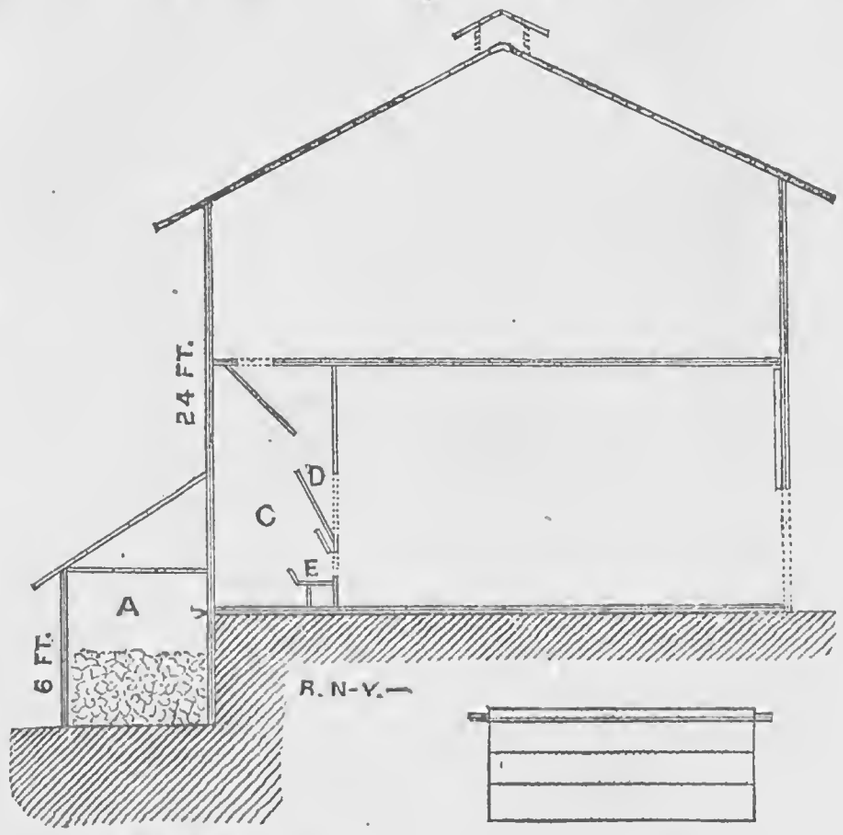
be perfect, and a fence in front would confine the sheep in a yard, in which they could be fed in stormy weather. For a more pretentious sheep shed the same plan can be adopted, as shown in the illustration, Fig. 234, which is intended to represent sheds for a flock of 100 or more sheep. If it is desired, room may be made above the shed for hay,



GROUND PLAN OF BARN.—FIG. 236.

and in that case the poles should be 10 or 12 feet high; the hay floor being made about seven feet above the ground. The shed may be 16 feet wide, with a full roof. A feed rack should run around the whole shed and other racks may be kept in the yard.

A barn that has been found very convenient for sheep is shown at Fig. 235. This is made



SECTION OF BARN.—FIG. 237.

DOOR.—FIG. 238.

with the pens eight feet high; the posts are eight feet apart and swinging doors are fixed between each pair of posts. The doors are double, one hung above the other, so that the upper or lower one, or both, can be closed when desired. The doors are hung upon pins fitted into the ends, as shown at Fig. 238. Some of the pens may be inclosed and kept for separating ewes from the flock at lambing time. The upper part of the barn is kept for fodder and the interior arrangement is shown at Fig. 237, and the ground plan at Fig. 236. In the rear of the barn (at A, Fig. 237), is a root-cellar. At C, C, Fig. 236, is the feeding passage, over which are hay chutes to carry the hay into the rack D, Fig. 237, which opens into the stable by lathed bars placed up and down. The bars are not more than three inches apart, to prevent the sheep from pushing their heads through and tearing the wool from the necks. A feeding trough, E, Fig. 237, for grain or chopped roots, is under the hay rack and is opened or closed by a falling door or shutter, which when open, is held by cords and hooks to the sloping bottom of the hay rack. A stair-case or steps B, Fig. 236, leads from the feeding passage to the hay floor and the hay should be so arranged as to leave a passage-way above. The hay floor should be of matched boards to prevent dust and chaff from dropping on to the sheep and getting into the wool.

Although abundant ventilation is provided for by the ample doors in front of the shed, it will, nevertheless, be advisable to have at least two air-shafts from the stable to the roof. These should be about four by six feet, and made of matched boards some of which should be hung on hinges and fastened by bolts that they may be used to pass hay down to the stable floor at times. These chutes should be two inches larger each way at the bottom than at the top, so that the hay will not lodge in them. The feed passage communicates with the root cellar by two or three doors, as may be convenient. With a cellar arranged as on this plan the method of preserving corn fodder by ensilage may be very easily practiced if desired.

Dairy Husbandry.

THE DAIRY COW. NO. 31.

HENRY STEWART.

Breeding Dairy Cows.

THE dairy cow is an artificial production. As such she is subject to continual improvement. We cannot tell within reasonable bounds what may be the maximum product of a cow in butter, although there are physiological bounds within which the product of milk must always be confined. A cow can never produce more milk than the capacity of the udder permits, and there is a limit to the size of the udder. It may perhaps, however, be justly considered that we have reached the extent of all reasonable demands upon the cow's power of producing butter, if we are to believe that this product may have reached the astounding quantity of nearly 800 pounds within a year and from one calf to another, as has been claimed for more than one or two cows. If a cow can be made by the most careful breeding and feeding to produce half of this quantity, or an average product of one pound per day through the whole of a year, we may consider, perhaps, that we have reached the ultimate capacity of an ordinary cow. But it may very well be believed that this may be done by a continued course of judicious and skillful breeding.

To do this the cow must be thoroughbred; that is, each dairyman must for himself undertake a course of breeding in his herd, which must be rightly begun and rightly continued, and with a right selection of materials. By continuing this course the dairyman will have, in time, a thoroughbred herd, in which there will be a concentration of the best blood and the best qualities of the animals he has been able to secure for his use. Now one may start with but commonplace materials, and by selection and the use of better blood from without, he may in a few years have a herd of cows that will possess a similarity of character, being closely related both in blood and milking quality. But if the dairyman can afford to begin with a selection of good cows and introduce the blood of a superior kind of dairy stock, he can do in five years what he could only hope to do with poorer materials in twenty. In this case time and money are equivalent and by the expenditure of money, the labor of many years may be saved; on the other hand, by this labor the money that would otherwise have to be expended is saved.

The dairyman, then, who desires to set about improving his stock of cows from within his own herd will select the best cows he can procure and will mate them with a bull of known pedigree and pure blood. This is the first essential. Without this there can be no success. It is the very corner-stone of improved breeding, and the ignoring of this requisite has led to the loss of years of labor, and to weary disappointment. The bull having been procured and the cows selected, it is well to have the animals mated in March, April and May if possible, for this will bring the calves at such a season that they will be weaned and put on grass at the age when they can have

the most benefit from it, and will make a good growth and become strong before their first Winter arrives. The rearing of the calf is the building that is to be put upon the foundation mentioned; and that is of sufficient importance to be referred to more particularly hereafter. But a good summering on grass will have the effect to enlarge the frame of the calf and to develop its digestive powers, both being essential to a good cow. It is also a good season for the cow to begin milking, and she will come into her full flush when the first grass is ready; the calf will then be out of the way; and the whole attention can be given to the butter-making.

When the cow is young and has her first calf, it is advisable to put off her second breeding for six months after her first calving, so as to form a habit of persistent milking and the milking should also be continued as long as any milk is yielded, if it is only a quart, or even less. A young cow at this period, is in course of training for her future usefulness and this is a part of her breeding. She should therefore be induced or compelled to contract a habit of long-continued and copious milking, and only such cows as possess this quality should be kept for breeding. A heifer should be bred, too, at an early age. Twelve to fifteen months is late enough so that the young animal should come into profit at, or a little before, two years of age. Her first breeding should be carefully managed, for the first mating will exert an effect upon all her future progeny. If a coarse, common bull is used, the damage will remain during all her after life and all her future progeny will bear some of the marks of the first parentage. This is one of those curious conditions of animal physiology and is difficult to account for, but it has been so often observed and proved that one cannot reasonably doubt the truth of it. On this account the first breeding of the heifer should be the best that can be secured. The calf of a heifer may safely be bred to its sire, and this is even advisable when an improvement is designed to be fixed upon an animal. If the sire has improved the dam he may be expected to improve still further the second generation, and a third cross may even be given, in special cases. Then a young bull from the best cow of the herd may be used, rather than to bring in outside crosses, unless there is the best reason for it. Some of the best herds that ever existed have had no outside blood introduced for many years, and this course is the best adapted for the improvement of dairy stock. There are exceptions, of course, and the breeder should be able to judge when he has gone far enough in line breeding, and make a wise and judicious infusion of new blood when it is necessary. But in this case the introduction should be from a source superior and never inferior in character to his own herd. Every step in improvement should be fixed and made a basis for another step in advance, and the greatest care should be taken that progress is not arrested by a mistake, else all that has been gained in several years of patient effort may be lost. The aggregate value of our dairy cows may easily be doubled in five years, if dairymen would take some trouble in breeding better stock, and abandon the wasteful and mistaken policy of producing calves of any kind whatever, never caring how poor they may be so that the dam may be brought into a milking condition. Such a method is too much like the mistake of killing the goose for the sake of the eggs it might be supposed to contain, and for a small, insignificant present advantage sacrificing a future profit, the aggregate value of which might be enormous, and which would not only accrue to the present generation but would go on increasing in a wider and larger scope year after year for the benefit of our children and their children after them.

The Swine-Yard.

BAD EFFECT OF IN-AND-IN BREEDING OF PIGS.

A CORRESPONDENT of the English Live-Stock Journal says that the largest number of really bad and valueless pigs he ever saw was in the year 1851, at the farm of the late Mr. Fisher Hobbs, at Colchester. There were about 100 of them, from two to four months old, not worth five shillings each for even fattening purposes, as they were very pot-bellied and of all shapes, with bandy legs, warped spines and all sorts of other deformities that one could mention. These bad points came, not from neglect, as they had the best of food and attention. It was solely from the result of too much in-and-in breeding. Aside from the above deformed, a few good ones were dropped now and then, which Mr. Hobbs sold for breeding purposes at from 10 to 20 guineas each; yet all these were soon used up. This shows how careful every one should be in undertaking too close breeding. In-and-in breeding may be practiced safely and advantageously to a certain extent and under certain circumstances; but when carried too far it may prove not only injurious, but even destructive to the lives of the over-closely-bred animals.

Mr. Hobbs, above mentioned, was a noted breeder, and at one time his pigs were highly popular. They were of a pure black color, and in shape much like the Small White Yorkshires of the present day, a fine specimen of which was represented in an engraving in a late RURAL. They were fine in all their points, matured early, fattened easily, and made tender, excellent side pork, but it was too fat for good hams and bacon. The males were excellent for crossing on a lean sort of common female swine, and these grades made good, thrifty porkers. A.

The Poultry Yard.

American Sebrights.

THESE beautiful bantams, referred to in the RURAL of April 19, originated, I am pretty confident, with Sir John Sebright (I think his first name was John), [Yes, M. P. for Hertfordshire.—EDS.]; at any rate he was an English knight. Many years ago several friends and myself kept these beautiful birds, and they bred as true as any other sort of our flocks. If they do not breed true now, I presume it must be in consequence of some out-cross of another kind of fowl which has been taken on them since coming to America. It is a great pity that this has been done, for they were not only among the handsomest of the poultry-yard, but also of the most hardy, thrifty and among the best layers, sitters and nurses. A. B A.

[The Sebright to which our correspondent alludes, as mentioned in Querist Department of above date, is not the old-time Sebright breed produced by Sir J. S. about 60 years ago, but, as stated, a recent mongrel American sort, which has been exhibited at several poultry shows. The former, here and elsewhere, still breed as true as when our friend and his friends kept them; but the latter do not and never did.—EDS.]

Industrial Implements.

The S. R. Nye Improved Bay State Rake.

This rake is manufactured by that trustworthy old firm, the Belcher & Taylor M'f'g Company, of Chicopee Falls, Mass., a sure guarantee that it is made of first-class material and in a thoroughly workman-like manner. It is an implement so strongly made in every part that the chances of its getting out of order are reduced to a minimum. The peculiar shape of the teeth prevents them from scratching the ground so that the gathered hay is unusually free from dust, and the position of those at the ends of the rake in advance of those in the center, prevents the hay from scattering—a feature of special advantage on a hill-side or

THE S. R. NYE IMPROVED BAY STATE RAKE.—FIG. 239.

gleaning The teeth, being held in their places by a guide, do not flop about, while as each acts independently of the others it can pass over an obstruction 20 inches high without affecting those alongside of it in the least, thus enabling it to rake uneven ground in a clean manner. Being dumped almost entirely by horse power, a foot pressure of only a couple of pounds is needed. We strongly advise all who may be in need of a rake the coming season to send to the above address for circulars describing this one more in detail and containing a number of testimonials speaking highly of its efficiency from various prominent farmers in different parts of the country. G. E. B.

MR. J. R. WHITTEMORE, Chicopee Falls, Mass., is the manufacturer of a rake with independent teeth so constructed that they do not catch up the dirt or old rubbish while raking up the hay in a cleanly and easy manner. His advertisement appears in this issue.

Miscellaneous.

"KNOWLEDGE, NOT GUESSES."

GEN. WM. H. NOBLE, BRIDGEPORT, CONN.

I HAVE just been shown the comments of H. S. in the RURAL of Jan. 23d on my Christmas article headed as above. Had his murder of logic and discolor of my sayings and moods been seen when first out, he would have won a straight reply. So far as personal to myself, what he says about my temper and purpose in writing is not deserving of notice. The great public of readers have no stake or interest in H. S. or "Gen. Noble," beyond the soundness of their facts and logic. But in behalf of right thinking and writing, and the courteous brotherhood becoming the garden and the farm, I invite notice of the facetious shams and unfairness before which H. S. postures himself as a literary athlete.

And first, H. S. says that I write in a "real state of mind," in "ill humor, or mad about something;" as if my moods had anything to do with my facts or logic! What help doth the world get to right methods in rural life out of facetious smartness over another's infirmity? But neither did I in that article, nor do I ever, vent the spleen, of which I have a good share aboard, through the columns of a rural journal. If I write at all, I write to help its work, and not to let out my ill-humor, or to make a spread of how much I (or anybody) do or do not know. H. S. will find it much easier to set up and ride down with literary lance shams about facts or temper, than to deal with their solid front and sound logic. No unfairness towards another, no parade of what you do or you do not know, will make up for the want of these.

H. S. next says that my charge against crude and thoughtless writing was aimed at your graceful and senseful corps. It's enough to say to this that I am not so big a fool as not to know sense and good English and sound logic, from anything that apes either.

H. S. then tries his hand at the reasoning art. The paint of linseed oil, advised to kill the coccus, killed both the coccus and my trees, H. S. says I have no right to grumble: that the killing was the logical result of the prescription given to cure. This is good news for quacks. H. S. can now take the head and cake on logic. When the doctor cures the disease by killing the patient it's all right! It's just the logical result!! Nobody is to blame!!! That will do, H. S. Go up to the head.

If such logic is not one of Wendell Phillips's "Lost Arts," it ought to be. In it the world's history has only two rivals of H S—the immortal Bunsby, whom Capt. Cuttle so worshipped in Dombey & Son, and the Heathen Chinee. The likeness of H. S. to Bunsby is rather in lucid profundity than in feature. But he is the very Dromio of the "Moon-eyed."

Hear the great Bunsby roll out his logic and opinions to Capt. Cuttle: "If so be he's dead, my opinion is he won't come back no more,—if so be as he's alive, my opinion is he will: do I say he will? No. Why not? Why not? because the bearing of this observation lies in the application on't. For why? which way? if so, why not? therefore!"

But the Heathen Chinee's invention of roast pig is a case in point, going, as the lawyers say, on all fours with H. S. The Flowery Land first tasted the toothsome viand of a roasted suckling when a litter was cooked in the flames of a burning dwelling. Directly John Chinaman saw the "logical result" as clearly as H. S. Roast pig and burning houses became chronic together. The method was rather allopathic, to be sure, a good deal of roast, for a very small pig. But in this the Heathen Chinee and H. S. are peculiar. "The bearing of this observation lies in the application on't." To cure the disease, kill the patient. Mr. Bunsby can now "step down and out." H. S. and the Heathen Chinee have the floor.

Just as wide of the mark, but in better taste, is H S.'s attack upon my text, "Knowledge, not Guesses." I say again, "not even well-thought-out opinions are wanted, unless backed by facts and logic." I put neither a brake nor embargo on any man's thinking or telling what he thinks, if he only backs it by the why he thinks. When H. S. says he thinks the English sparrow picks the corn-grub as well as the grain from his ears, and backs that opinion by the next year's freedom from the pest, he gives us a chance to judge about how rightly he thinks. We can tell about the matter just about as well as he. It becomes pretty plain that the English sparrow wants a deal of study on his grub work. Before H. S. has a right to say that he eats the grubs, we need more years and closer scan of where the grub goes to—into the sparrow's crop or into the ground.

Before H. S asks this *thought* of his to save the sparrow, and get him a better name, he should show us how much among the cornfields the sparrow roams; how many other worms and grubs he gobbles. Above all, a good place to see where the grub goes to, is in the sparrow's crop. That is where are found the tell-tales about bird work on insect, grub, or grain. Such looking at one fact, and guessing at a conclusion, sometimes called thinking, no more warrants an opinion than one swallow makes a Summer.

So I say to H. S., and all; study out your opinions, through facts and trial. There is need of careful search and test, to save the seeming facts from becoming a mental delusion and a snare of thought. It is only courageous patience that winnows the chaff from the grain of opinion. It is only the short-sighted guessers who hurry up to say: "I think," and "I think," "because I saw this and I saw that." It's just this sort of hurry which entails a lot of blunders, springing up into a ten-fold harvest of follies and failures. A blunder is just as much a crime in the garden or the farm as elsewhere.

Yes, tell us what you think, but in the same breath tell us why you think so. The history of human effort and reach of knowledge in every line of life, is filled with apt indorsement of my text. At the same time, I fully heed that forecast of intuition, which, in all we know and enjoy, has by methods of the brain, too rapid to trace, grasped the great truths and inventions which hold and move the modern world. The apple's fall, revealing to Sir Isaac the force that swings the universe, was but one of the lightning methods by which the airy visions of some intellects, over the great drift of facts, settle into solid knowledge, and "reason for the faith that is in us." The grand results of human effort all through the life of man on earth, are largely due to a lightning grasp of truth by methods whose "ways are past finding out." Steam's mighty sway and push of industries, the lightning's voice and light, the foretelling of the storm and the tidal currents of the air, the fire-fed iron horse and all his wondrous work for man were born of rapid "thought's pale forecast." With wings as of the morning light, by paths and methods without trail or span, intuitive thought has forecasted the grandest achievements in human life. Of such is the mental quality that lifts the generations to higher planes of what we know, and to surer standing ground. The world owes as much to this lightning process as to the Baconian methods It's true, the latter are a good deal safer for the average brain. But all along the stations of man's advance, at rare intervals, God has stamped on some one an intellectual or moral divinity. The thoughts of such are not guesses, or airy muslugs, or jumps from very small facts to very big conclusions. They are intuitions that speak by results. Let mortals of slower movement and shorter reach of thought, beware how they ape the eagle's flight. I am content to feel my way along the paths of knowledge, and to never tell what I think, till I have studied out the why.

BOOKS, CATALOGUES, ETC.

THE SOCIETY FOR THE PROMOTION OF AGRICULTURAL SCIENCE will hold its annual meeting at Cincinnati, on Tuesday, August 16, 1881, the day preceding the sessions of the American Association for the Advancement of Science. It is hoped that every member will endeavor to be present, or will send a paper to the Secretary to be read. The announcement of the hour and the place of meeting will be made at a later date. The following gentlemen have indicated to the Secretary their readiness to present essays at the coming meeting:—Professor S. W. Johnson: Patrick Barry; Professor W. J. Beal, subject, Testing Seeds; Professor J. Henry Comstock; Professor E. W. Hilgard; Professor R. C. Kedzie, subject, The

Ripening of Wheat; Professor A. J. Cook; J. J. Thomas; L. B. Arnold; E. Lewis Sturtevant, M. D. The members are earnestly requested to forward to the Secretary the titles of essays they are preparing to present, in order that such may be incorporated in a circular to follow this. The meetings for reading papers and discussing the same will be open to the public, and all persons interested in the promotion of scientific agriculture are earnestly invited to be present.

W. J. Beal, Lansing, Mich., President.
E. Lewis Sturtevant,
So. Framingham, Mass., Secretary.

Our thanks are due H. D. Woodford, of Auburn, N. Y., for a copy of the Premium List of the Central New York Fair, to be held at Auburn June 7, 8, 9 and 10, 1881.

RURAL BRIEFLETS.

Professor Blount would oblige us by stating whether the corn named after him was originally the Peabody Branching Corn. Mr. Waldo F. Brown, an excellent farmer, as we should judge from his writings, claims that they *are* the same.....

The question is whether glucose made from corn is as legitimate an article for sale and consumption as whisky, both being manufactured from corn. Two wrongs don't make one right. But as between the mountain and the mole-hill of evil, it is better to direct our energies towards whipping the giant and to deal with the comparatively innocent little fellow afterwards.....

We have raised several varieties of the Italian Rocca Onions. They are of unsurpassed flavor (aroma—or would bouquet be better?); the bulbs grow to a large size and are of the handsomest appearance. But these fine onions do not keep well.....

Of lettuce we may now sow in the open ground Golden Stonehead, Tennis Ball, Early Curled Simpson. For succession, American Gathering and Shotwell's Brown Head are best. We cannot understand why the Cos Lettuce is not more generally planted. We have raised it for several years in the open ground, and without tying the heads to blanch them as many do; the leaves are tender and crisp....

Of cabbages we may commend the Early Wakefield, Early York for earliest, Early Winningstadt and Fotler's Brunswick for second, Silver Leaf Drumhead, Large Late Drumhead and Large Flat Dutch for the main crop. Probably for family use the Drumhead Savoy is best. A few heads of red cabbage should not be forgotten. It is excellent for pickling, and its bright color makes it preferred to the white kinds.....

The Early Bassano Beet is as good as any for early Summer, and the Early Blood Turnip Beet for the main crop. We have never raised a beet that for its tenderness and sweetness we prized more highly than Vilmorin's White Sugar. It is, however, of small size, and not well suited to cultivation for market.....

There are no better greens than half-grown beet leaves. For this purpose it is well to sow a few rows thickly and to thin them out for greens as needed.....

We urge our friends of the West to plant Catalpa bignonioides speciosa for its quick growth, the durability of its wood, and its fine appearance as a shade or ornamental tree. It will endure 16 deg. below zero at least.....

We are very sorry to see that, through errors which have arisen from a confusion of names, Durra, Donra, Egyptian Corn, Rice Corn, etc., are advertised by some seedsmen as throwing up several stalks from one seed, which may be cut several times during the season. We have tried the different kinds named above and found that, as a rule, but one stalk grows from a seed, and that, like Indian Corn, when it is cut that is the end of its growth. Besides, the stalk is heavy and woody, and the leaves present, comparatively, a smaller extent of surface than those of Indian Corn.....

We learn from certain retailers that they are selling ten tubs of oleomargarine to one of dairy-made butter.....

What Others Say.

The Unwisdom of the Cotton Planters.—If the determination of the size of the cotton crop were left with one financial interest not more than four million bales would be raised next year, says the Macon Telegraph and Messenger. When the Dutch East India Company find they are raising too much Java coffee to command a good price, they have two ways of disposing of it. One is to lock up the excess and hold it for a short crop, and the other is to burn it in furnaces made for that purpose. They have no idea of raising coffee to lose money on it. But we people of the South have little practical idea of doing anything else. Cotton lint is many times more indispensable and valuable than coffee. It is far more exclusively a product of one country. The Southern people could just as easily get 20 cents a pound as 10 cents, and it would make us all happy and comfortable. We could live liberally and pay our debts. But simply because all of us are struggling to swell the crop to the largest possible dimensions, under the silly idea that we can make more money out of it, we ruin ourselves and toil from year's end to year's end without accumulating a cent of profit.

Another Wonderful Butter Cow.—An unpretentious looking little cow was led through this city yesterday, en route to the farm of Mr. Erastus Corning, says the Albany N. Y. Argus. The animal was purchased by Mr. Corning, of Mr. Burns, at Middletown, Herkimer County, whence she came to this city by express. She is of the Jersey breed, is five years old, and bears the handsome name of "Gold Thread." It is claimed that 23 per cent. of her milk is cream, and that she can produce 18 pounds of butter per week. It is understood that she was purchased for Mr. Corning's private use, and that the sum paid for her was $1,500.

In systematic breeding we seek to have control of the two parents, says E. L. Sturtevant in the N. Y. Tribune. In the ox tribe, we seek to exercise selection upon the cow and the bull, by seeking those animals which come nearest to the ideal that we have in our mind, and also animals which we know are descended from parents possessing the qualities that we are after. Let this same idea be exercised upon plants, and we may have seed breeding.

The N. Y. Sun says, speaking of trichinæ and trichinosis, that cleanliness in the hog pen and yard is the first step, and the second is to avoid allowing hogs and pigs to catch or eat rats or mice, which are really the most prolific disseminators of these dangerous parasites. It is a very common practice with many farmers to throw all sorts of offal and filth into their hog pens, and if their boys happen to kill or wound a rat, he goes in among the rest, thereby endangering the life of every person who may eat pork raised on that farm. [We wonder if the Chinese suffer from trichinosis more than other people?—Eds.]

German country roads are to a great extent kept in repair, according to Dr. Englehardt, by sale of the product of fruit trees and grass grown at the roadside. Sections are kept in repair by officials who accept the proceeds of the fruits and hay for a large proportion of their services.

Mr. Stewart says in the N. Y. Times that the potato contains 75 per cent. of water, two per cent. of nitrogenous matters or flesh-forming substances, 21 per cent. of carbohydrates, chiefly starch and digestible cellulose; 0 3 per cent. of fat, and the ash is rich in potash, of which it contains 59 per cent. with 19 per cent. of phosphoric acid. . . . . This shows conclusively that the potato is a food that should be productive of a strong, sound, animal existence. The large proportion of carbohydrates is peculiarly adapted for the support of a laboring man whose exertions stimulate the functions of the lungs excessively, and require a corresponding supply of carbonaceous matter to support the quickened respiration and the increased animal heat. . . . . It requires a deeply plowed, mellow soil, in which the roots may spread and feed plentifully, for this crop is a hearty feeder. Well-rotted manure, a well-turned sod, wood-ashes, superphosphate of lime, with a light mixture of guano or poultry manure and compost of swamp muck, lime, salt, and well-decomposed hog or cow manure, are always beneficial. . . . . .

In the putting up and shipment of goods the Grocer gives these general directions:—Send only good articles. The freight and other expenses eat up poor goods. Put up everything in good order. An attractive look secures examination, and often makes a sale where a dirty package or a slovenly appearance fails. Pack securely, so that the motion will not allow the contents to change about. Use plenty of clean, dry, fine-cut straw with eggs. Mark plainly with paint—a stencil plate is best—and note contents on the box or barrel, stating the amount also. Secure for yourself a reputation for fine goods, put up in the best shape, so that your mark is in demand.

We find the following in the London Agricultural Gazette:—"The Americans have gained a market for meat on this side of the Atlantic, and they will no doubt keep it; they expect to be able to supply 'a hundred millions' worth' of meat for exportation, and in time they may do it. . . . . The Americans themselves anticipate an enlarged continental trade in meat, and the ablest European statisticians have expressed the opinion that if all goes well they will not be disappointed. . . . . There are thousands of herds which only require the introduction of 'pure-bred' and 'first-class' bulls of the respective breeds which may suit the different neighborhoods, to increase their value most materially. . . . . An eminent Shorthorn auctioneer has declared that a bull is half a herd."

And again, referring to the sale in England of oleomargarine, it says:—"The substances thus sold under a misleading designation are not in themselves unwholesome, and Government will do nothing to check their importation. The essential difference between butterine and good butter lies in the difference of flavor. Let only good butter be made, and butterine will never injuriously affect the price of English dairy produce."

The Agricultural Gazette says that editors in search of copy are apt to be indiscreet. . . . . Lord Brougham said—when he heard that Lord Campbell, a rival Lord Chancellor, was writing his life—such publications add "a new sting to death." . . . . . Mr. Crawford, of Ohio, says that it is easier to plant a new bed of strawberries than to clean out an old one. . . . . The people who never furnish any chips to help keep it warm are the most vociferous in calling this a cold world. . . . . .

Everywhere.

RURAL SPECIAL REPORTS.

Fla., Starke, Bradford Co., April 14.—I suppose our Winter has been like Summer compared with yours, yet we have had the coldest Winter and Spring known here for many years. All through March we had very cold winds with occasional frosts, and on April 2 we had ice as thick as window glass, doing a good deal of damage as far south as Enterprise. It continued very cool until the sixth when it became so very warm we thought Summer had nearly come, but find we were mistaken for it is now cool enough to make a good warm fire comfortable to sit by. Notwithstanding the cold weather our yard is full of flowers—roses, honeysuckles, verbenas, pansies, wistarias, jessamines, phloxes. The last has been in bloom all Winter, is self-sown in endless variety and so thick all over the yard, in the paths and everywhere, one can't help walking on it. It is like a weed but so beautiful we just let it grow. In a few weeks the hot sun will burn it up and the most of it will disappear until next Fall. We do not think the December freeze hurt our orange trees at all, but the cold winds and frost this Spring have injured the fruit to a great extent. Our guavas, lemons, limes and citrons of commerce were killed to the ground. Eucalyptus trees were entirely killed. Tea plants and olives were not hurt. Our raisin grapes came through the Winter in good condition. They are two years old from cuttings, and some of them are fruiting. The La Conte Pear trees are doing finely here. Peaches, plums and quinces are well loaded with fruit. Everybody has had to plant cotton the second time on account of frost. Early vegetable raisers will make no fortunes this year; everything grows so slow; the nights are too cold. We have fodder corn that has been growing two months and it is only six inches high now; last year it was fit to eat at this time. I. S.

Iowa., Emerson, Mills Co., April 18.—Our Spring is backward, but we have had a few days of fine weather. The frost is nearly out of the ground, and if fine weather continues we shall seed some this week. Planting will be late for this section, but I think the land will be in fine condition. R. P.

N. C., Henderson, Granville Co., April 16.—Now that the Spring (although a cold one) is opened, I find that about 1,000 out of the 7,000 of my budded peach trees are as full as possible of healthy blossoms—all were in a corner slightly protected from the west by woods. All about this region, wherever peaches were protected by pine groves at the west, they are entirely uninjured; where no such protection existed all is a perfect blank as to blossom, but the wood of the trees is not hurt. One large orchard about 30 miles from here, occupying about 400 acres, is entirely sound and a mass of blossom, as I heard this morning; so, after all, North Carolina may furnish perhaps at least half a crop for the market. A week or ten days ago, for several days, such severe cold westerly winds, with thick ice at night, visited us, that, but for the excessive dryness then prevailing, there would have been a total destruction of the peach crop, at least, and probably also of pears, cherries, plums, etc., which, like apples and grapes, promised the most abundant crop ever known about here. Our season, however, will be all of four weeks later than last year. Strawberries and Fall wheat are much hurt in places, being so exposed to the unprecedented cold at times without any covering of snow, of which during the whole Winter we have had none worth speaking about. Only once for a short time have we had ice of sufficient thickness for sliding or skating, and only at short intervals was plowing suspended, and rarely, if ever, has this been the case after mid-day. So we feel that we are not located in the worst place in the United States, especially when reading the heart-rending news from the West, etc. Still no person living ever saw such a Winter here before. H. S.

N. C., Brookston, Warren Co., April 12.—We have had some pretty severe weather for April—temperature at sun-rise on the 5th, 27 deg. The peaches that escaped death in Winter are "done for" now. M. B. P.

N. Y., Sharon Center, Schoharie Co., April 23.—After five months of severe Winter weather Spring is here at last. We had freezing nights until the 20th inst. No farm work of any moment has been done as yet. Grass and grain are looking fine. We need a good rain to clean the snow off. We have hitherto had no rain or southerly winds as usual to liquify it, and we still have a good supply of it. Wages for farm hands are from $12@18 per month and board. Hay is worth $13@15 It has been $20. Cows are selling for $30@35; oxen are in demand at $125@150; butter 20@24 cents; eggs, 15 cents; potatoes, 50 cents and scarce; apples $1 a barrel. Incog.

Ohio, Napoleon, Henry Co., April 20.—The season is at least three weeks later than usual. Leaves have not yet been put forth by any tree or shrub; even the catkins have not yet appeared on the willows. No one has started the plow, and few have even begun gardening operations. Last year at this time oats were sown and all were busy plowing for corn. This is one of the most fertile parts of the State. There is still plenty of room for settlers. Potatoes are worth 80c.; apples, 40c.; butter, 18c.; eggs, 10c; fat hogs, 5c. per lb., live; horses of all descriptions are high. V. J. E.

Ohio, Camden, Preble Co., April 22nd.—We have had a very late Spring and but little plowing has been done here yet. This week has been fine and there has been a considerable area of oats sown since it turned warm and dry. Grass and wheat are starting nicely. Wheat in this locality looks quite well. A friend of mine has just returned from Fountain County, Ind., about 150 miles west of this, and he tells me the prospect for wheat is very poor. He passed through Richmond, Indianapolis, and Crawfordville. Wm. M.

Ohio, Aurora Sta., Portage Co., April 19.—We feel good in Ohio. The last of the snow went to-day, and the sun came out warm and Spring-like and the ground begins to take a greenish hue. Farmers have just commenced plowing for the Spring crops. In addition to this, I carried my milk for the first time this season to the creamery, and for it received 10 cents per 10 pounds. J. G.

Pa., Light Street, Columbia Co., April 18. The wheat looks as if it would make about 75 per cent. of a full crop. The Winter has been the coldest known here for many years. On the 2d of February the mercury was 26 deg. below zero. But little plowing has been done yet for oats. Bees have wintered badly; two-thirds of those in this county are dead. I lost about half of my colonies. H. H. B.

Pa., Winterburn, Clearfield Co., April 18.—Spring is opening slowly, there being plenty of snow to be seen yet. The Winter here was the severest ever known. We had good sleighing during four months. The dry Winter has made fodder scarce. Hay is worth $20, and scarce at these figures. Where wheat has emerged from the snow it looks well. H. F. S.

Texas, Waco, McLennan Co., April 14th.—I am more than thankful for the "Free Seeds" the Rural sent us this Spring. I have planted them, and they have all germinated well. I was surprised to see the asparagus seeds coming up so soon, as I was under the impression it took a long time for them to germinate. I have not a good stand of the Branching Sorghum, but this may be all the better, as it will have more room to branch. A "norther" came down upon us on the 12th and closed up last night with a severe frost, that has played sad havoc with our fruit and vegetables. Ice was formed on still water, and all the fruit and garden vegetables are destroyed. Corn and potatoes are badly damaged; the new growth of grapes killed; peaches and plums as large as acorns are black and wilted. This is a severe blow to us, as we had hoped to have a crop of fruit—the first in three years. Last year our destructive freeze occurred on March 13, just one month earlier. Our season is later than usual, but vegetables, etc., seem to be ahead of the season. Very little, if any, cotton is up yet, which is fortunate for the planter, as it is a very tender plant. The ground is dry on top, or the corn and potatoes would have been entirely destroyed; as it is, they are only partially so. Some of the seeds of the "Iris Lævigata," received from the Rural, and planted on March 31, last year, are just coming up. I left the boxes undisturbed sunk in the ground, and I hope yet to be rewarded for my patience, by having some of the magnolias to come up. I am sorry to see so much opposition expressed against our worthy Commissioner of Agriculture, Gen. Le. Duc.

I have watched his course pretty closely for the last two years, and from my stand-point I can see no reason why a change should be desired. 'Tis true, there have been many things done by Gen. Le Duc, that I would not have done, or perhaps would have done differently; but it is a mooted question whether either would have been an improvement on the present administration of the Department. I hope the President will not be induced to make a change, merely to gratify the aspiration of political office-seekers, and especially of the individual who thinks himself so eminently fitted for the position. A passion for flowers has taken possession of many of our people in the last few years, and ere long we shall be able to vie with Florida for the name of "The Land of Flowers." The yards of the residents along the streets of Waco are a perfect wealth of bloom, and their fragrance perfumes the very air we breathe in passing by. My yard is now a perfect blaze of blooming flowers of various kinds, from the rose, the "Queen of Flowers" to the modest mignonette. I have the handsomest phloxes I have ever seen anywhere, and the greatest variety of them. I think I have a novelty in one plant that bears two separate and distinct kinds of bloom. One is a deep purple, with a dark center, and the other is white with light purple center; and they do not change to these colors, but open up as such. I have also petunias that have a solid deep purple bloom, and white-and-pink stripes on the same plant. Are these things common? [Quite. Eds.] I received a lot of roses a few weeks ago from Louisville, Ky., and among them was the "Countess of Oxford" bearing a full bloom, packed in the box with a large lot of others. I planted it in a pot, and it never lost a leaf, and the bloom remained fresh and fragrant for eight days. This rose attracted a great deal of attention, and its safe arrival must be regarded as a great and noteworthy feat in the packing and shipping of plants; and it goes to show that when plants are packed by parties who know the wants of the different varieties there will be no losses in plants received from abroad. The fact is, I received at the same time about 100 roses in a box, and have not lost a single one, and but few of them dropped their leaves. I attribute it to the manner of packing, but it may have been owing to the vigor of the plants. We had our first mess of strawberries a few days ago, but I fear the freeze last night will put an end to that luxury. A. S. S.

TEXAS, Dallas Co., April 16.—We are getting fearfully dry down here. No rain since the 18th of March. We are needing a shower very much at this time; more rain and less frost is what we want. On the 14th inst. we had a hard frost and the fruit was all killed, even to grapes which, being out, were killed. Corn, too, was killed to the ground and some cotton was up and got bitten. My Washington Oats were up and looking very well, about half the plot was killed. None of my other RURAL seeds were up. I think the White Elephant is too late for this climate; none but early potatoes will do any good here. Our prospects are rather gloomy at this time for a crop of any kind. N. H.

TEXAS, Dayton, Liberty Co., April 14.—Spring is very backward, and yet most of the corn planting was done ten days ago, while a few are even planting cotton. One of my RURAL Distribution magnolias has come up after lying in the ground a year. It is now about six inches high. In the same plot is an ash that has grown wonderfully, and is now in full leaf. Last season it grew seven feet. I fancy it must have got mixed up in your seeds somehow, as there are no ash trees within miles of my residence. G. G.

VA., Wythe Co., April 18.—High wind still. We never had so much cold wind in April. The growth of grass is checked and cattle owners are anxious about feed. We are still feeding in stanchions on cut fodder. Vegetation is backward, and there has been but little weather suitable for plowing. Corn-planting will be much delayed. However, we have improved every moment and have much plowing done, potatoes planted, fences made, and orchards pruned. Peas, onions and radishes are growing, hyacinths, narcissuses, and Crown-Imperials blooming, cherry, lilac and spirea buds swelling, and, altogether, there are some signs that Spring may come in May. We hope to derive one blessing, from this severity—fruit. It often blooms too soon and is killed. M. L. S.

WEST VA., Short Creek, Brook Co., April 20.—In this county there are some very fine farms and very fertile tracts. It abounds in bituminous coal and limestone, and the latter being very near the surface seems to impart to it some of its fertilizing properties. We have a fine growth of grass always and never miss a splendid corn crop, three corn crops in succession yielding not less than 60 bushels to the acre and often 100. Farms are worth $100 per acre. Our great staple product is wool—Merino of a fine quality. Farmers are backward with their work owing to the coldness of the Spring. Never in the memory of the "oldest inhabitant" have we had such a severe Winter. Wheat looks exceedingly well; peaches are entirely killed. What the apples will be time will tell. P. D.

WIS., Bay View, Milwaukee Co., April 18.—We have had a very severe Winter, with much snow. For the past few days the snow has been rapidly melting. J. S.

The Querist.

ANSWERS TO CORRESPONDENTS.

The 12-Spotted Diabrotica.

J. A. S., Van Wert, Ohio, has been growing cucumbers on a large scale for pickles, and last year they were for the first time infested by a bug resembling the squash or cucumber bug, except that this had a longer body and was speckled all over with small, glossy, yellow, gray and dark spots. It began operations on the base of the vine, eating holes all through the stock. Shortly afterwards the vines wilted and instantly died as if cut clean off. These new pests are now ten times worse than the old sorts, for the remedies that would end the ravages of the latter haven't a bit of effect on the former, and our friend asks what is the name of the persistent newcomers, and whether there is any remedy for them.

ANS.—While it is impossible to say positively, yet we think from the description that the "bug" is the 12 Spotted Diabrotica (Diabrotica 12 punctata). It is more or less abundant every year in gardens and has been found imbedded in the rinds of cucumbers, squashes and melons, though we do not know of any instance where it has before been found boring into the stems of cucumber vines. If the cucumbers are raised on a large scale in the field it is probable that planting in another field at some distance from the one infested last year, would be a partial remedy, as the beetles pass the Winter in the ground. As soot is very distasteful to all insects, it is perhaps as good as anything that can be applied to prevent the ravages of these beetles. A little mixed with the soil with which the seeds are covered will serve to keep grubs and worms away from the stems and roots just below the surface, while a small handful thrown on the hills below the leaves, in such a way as to be close to the stems, will probably keep them from being injured. If this be done in the morning while the dew is on, or the plants be sprinkled so that the soot may stick to them, it may be more effectual.

Late-Blooming Peaches and Apples.

O. C. D., Wellville, Va., asks what varities of peaches and apples blossom late so as to escape the late frosts, which are the chief causes of injury in that section.

ANS.—Among peaches the difference in the season of blooming is very slight—at the most not exceeding three or four days. The very early varieties, such as Hale's Early and those of that type, so far as we have observed, usually bloom a little in advance of the average season. It may even be a matter of doubt whether nearly or quite the entire difference of time may not be more properly chargeable to difference in soils, vigor of trees, exposure or aspect, than to any innate difference of varieties. So far as apples are concerned, the great mass of varieties, so far as we have had opportunity for observation, differ little, if any, more than peaches, and seem to vary in season of bloom mainly from similar causes. Still, among apples there are a few varieties, such as Rawle's Janet and Northern Spy, that serve as marked exceptions, usually opening their blossoms a week or ten days later than others. The two named, however, are the only well-known sorts that show such tardiness in a marked degree, so far as we are aware, although there doubtless are others possessing this peculiarity, but only locally known. The planter, in the locality indicated, as well as all orchardists, except, perhaps, at the extreme north, will be likely to find it one of the most safe and ready means of preventing too early blooming, to choose a northerly or northeasterly aspect for the orchard. This is found to be desirable even as far north as the latitude of Michigan.

Feeding Twin Lambs.

A. M. W., Rome, N. Y., asks what extra feed should be given lambs when the ewe has had twins and hasn't milk enough to support both in good condition. He has always fed cows' milk, but the lambs have generally got dull and died when a few days or a week old.

ANS.—Lambs are very easily over-fed when cows' milk is given to them and the milk is not a wholesome food for them. When a ewe has twins and has not milk enough for them, it is better to feed the ewe extra food to increase the milk than to give the lamb cows' milk. A quart of oat-meal gruel well boiled and sweetened with a little molasses, and a handful of bran, given daily, will generally be sufficient to enable the ewe to rear the extra lamb. If it is necessary to feed the lamb it is to be considered, first, whether it is better to have two poor lambs or one good one, by sacrificing one of them; and, second, whether one cannot be taken away and raised by hand, leaving one with the ewe. The writer has raised good lambs on cows' milk given fresh and warm from the cow out of a common one-quart kerosene oil-can with a long spout, with a piece of sponge wrapped around with a piece of cotton rag attached to it, to make a nipple. In feeding milk it should be taken slowly and by suction, otherwise it loads the stomach up too fast.

Merino Buckwheat.

D. G. S., Middletown, N. Y., sends us a sample of Merino Buckwheat and inquires whether it is of any particular value. It has, he says, a yellow blossom, is sown in Spring about the same time as oats, its flour makes a yellow batter, like that of corn-meal, and it is claimed that it does not produce itching like ordinary buckwheat.

ANS.—The seed sent is known as Merino Buckwheat, which goes under the name of India Wheat in parts of New England and New York. It takes the name of Merino Buckwheat probably from the wrinkled appearance of the grain. The grain is small, pyramidal in shape and has a suture on one side; the skin is thick and wrinkled; the plant is a constant bloomer and bears blossoms and seed, ripe and unripe, until killed by the frost. It yields flour that is coarse in quality and deficient in quantity and is altogether inferior to any other kind of buckwheat. It yields well in grain and serves a good purpose to grind with rye and corn for horse feed. It is equally heating as a food, when used constantly, as other buckwheats, but the itching complained of is doubtless due as much to the fat pork eaten with the cakes as to the meal. Buckwheat is not a good food for constant use, unless plenty of vegetables and pickles are also made a portion of the aliment. It is also better to use molasses or honey with it than fat pork.

Dressing for Lawn.

S. G., Goochland Co., Va., says:—"All agricultural books and papers advise the use of potash on grass lands. Supposing I cannot get any wood ashes, will a solution of concentrated lye, applied with a watering-pot, be of any good to a small lawn, or will it hurt? How much water should I use for one box of lye so as not to hurt the lawn?"

ANS.—This would be a practicable method of applying potash, but costly, excepting in a small way; only the potash lye should be used, and a pound box would be sufficient for two barrels of water. If you can procure guano from any of the grocery stores, that would be preferable. Potash alone is not sufficient for grass; nitrogen is even more necessary than potash. An excellent dressing for a lawn of a few square rods would be:—two pounds of fine bone, two pounds of Peruvian guano, two pounds of gypsum, and a pailful of fine, rich earth, well mixed, for each square rod.

Remedies for Girdled Fruit Trees.

J. S., Bay View, Wis., has an orchard of some 200 trees, some of which have been barked during the past season clear around for a space of from four to twenty-four inches and he asks, 1, whether anything can be done to save them; 2, if this is impossible will it be best to dig them out and plant others or cut them close to the ground and graft on to the stump.

ANS.—With regard to fruit trees girdled completely by field mice, in Winter, Downing says that all that is necessary to save them is, as soon as the sap rises vigorously in the Spring, to apply a new piece of bark taken from a branch of proper size, tying it firmly and drawing up the earth so as to cover the wound completely, the gnawed edges of the bark having been previously cut evenly down so that the pieces of applied bark will fit properly. When the tree is too large to apply an entire ring, separate pieces carefully fitted, will answer. It is well to reduce the top somewhat by pruning, that it may not make too large a demand on the roots for food. Another practice, which the same authority thinks more easily applicable, is to take several large grafts or strong twigs of last year's growth, and after splitting them in halves, pare each end down to a thin edge and insert them underneath the bark of the tree just above and below the wound. Tie the whole firmly with strong bass matting and draw up the earth to cover the place and keep out the air. In the RURAL of April 23 a correspondent says that an application of clay on the denuded part of the tree will cause the bark to grow again without a scar. According to our own experience, unless operated upon by an expert, those trees which are wholly girdled had better be dug up; those which are not should have moss or cow manure or something of the kind bound about the injured parts to retain moisture and protect against the air and sun. The cause of the injury is not stated. Tying laths about the trees or washing the stems for a foot or so above the ground with whale-oil or carbolic soap will repel rabbits.

Miscellaneous.

J. C., Valley Falls, Kan., asks, 1, whether there is any difference between Hungarian and Millet Grass; 2, is millet in any way injurious to horses given in reasonable quantities.

ANS.—1. Millet grass is botanically Millium effusum and is of no value for cultivation, so far as known. The Hungarian Grass mentioned we presume to be Panicum Germanicum and, according to analysis, it is one of the most nutritive forage plants in cultivation, and is all the while gaining friends. The grain is good for cattle or fowls. It requires about 80 days to mature. One bushel of seed to the acre is sufficient. The land should be pulverized and the seed harrowed in. 2. The seeds of all the millets are usually considered dangerous for horses and often for cattle also, probably because the animals are apt to swallow so much of the fine seeds without crushing them that they do not digest well. But if ground and fed judiciously they are doubtless wholesome food for all sorts of stock.

G. K., Litchfield, Mich., asks, 1, which is the better—felt or asbestos roofing, and where can the better sort be procured and at what price.

ANS.—1. The asbestos roofing we consider the better sort, as it is just as good a roof as the other for all ordinary purposes besides being a better protection against fire. It consists of strong canvas combined with asbestos-coated felt and manilla lining, rendered water-proof and compressed into a compact, flexible sheet resembling leather. It is furnished ready for use in rolls 65 feet long and 38½ inches wide, containing 200 square feet, with allowance for 1½ inch laps, weighing 60 pounds per 100 square feet. The manufacturers advise that it should be protected with asbestos roof-coating and what is called white fire-proof coating. The cost of the roof and the two coatings is $4 25 per 100 square feet. Sold by J. W. Johns, 87 Maiden Lane, this city.

J. E. C., Wichita, Kan., asks for some other way of destroying the green aphides besides hand-killing. Smoking them with tobacco has killed the plants while the pests hid in the earth, and after fumigation was over came out safe and lively—would sulphur or red or black pepper be useful against them.

ANS.—That they "have the start" is the trouble. Nothing is better than smoking. Smoke them oftener and less powerfully. We should not advise sulphur. Use tobacco tea for the soil.

B. F. H., Seguin, Texas, asks whether sulphur placed in the drill with vegetable or other seeds, or plowed under before these are planted, would be of any use in preventing the depredations of the "grub worm," and whether it would injure vegetation.

ANS.—We have tried sulphur for this purpose without any effect. We do not think it would prove injurious to vegetation.

M. M., Grundy Centre, Ia., asks, 1, whether the Hungarian Mulberry is a desirable tree to plant extensively and whether it would be hardy in that climate; 2, is the European Larch hardy there.

ANS.—1. We don't know anything about the tree. 2. Yes—quite.

S. D. R., Newfane, N. Y., asks, 1, where can he get a good subsoil plow to be used in preparing farm land for small fruit raising and other garden purposes; 2, is there any garden hand seed-drill with fertilizer attachment.

ANS.—1, R. H. Allen & Co., 191 Water St., New York City. 2. We do not know of any.

J. L., Oskaloosa, Ia., asks where tare seed can be obtained.

ANS.—We find them in several of the catalogues we have noticed. Try D. M. Ferry & Co., of Detroit. Price four dollars per bushel—25 cents per quart. Hiram Sibley & Co., of Chicago, should have this seed.

J. C. M., South Jefferson, N. Y., wants the address of a breeder of thoroughbred Chester White hogs.

ANS.—We do not know the address of any breeder of these hogs in N. Y. State. Thomas Wood, Doe Run, Pa., however, is an old breeder of them.

C. B. E., Reynale's Basin, N. Y., asks where can information be obtained about the United States lands that are for sale or settlement.

ANS.—If anywhere, from the United States Land Commissioner's Office, Washington, D. C.

H. M. D., Camden, Del., asks where can he obtain a machine for making bricks.

ANS.—Address J. W. Penfield, Willoughby, Ohio.

THE
Rural New-Yorker,

PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, MAY 7, 1881.

FOREST FIRES.—A dry Spring, like this and the last, seems pretty certain to cause disastrous forest fires. About a twelvemonth ago a vast amount of loss in New Jersey and Pennsylvania was due to this cause, and during the past week destructive fires have already been raging in both States. The Bureau of Forestry estimates that as much timber is annually wasted by such fires throughout the country as is cut for all useful purposes—an estimate that can hardly be thought exaggerated on considering the great extent of some of the conflagrations in unsettled regions where dense, virgin forests afford ample fuel. In the old-settled States, at the recent rate of denudation, it will not take many years to clear the country east of the Alleghanies of forest trees. Cannot some means be devised, at least in the thickly settled States, for preventing or checking such disasters? If the underbrush is kept down and the timber kept open enough to prevent the accumulation of dry leaves, fires cannot travel far, so that the clearing of our forests seems a safeguard.

WHY not? We certainly strongly advocate the measure. In these days, when every dairy product is liable to be adulterated by dishonest producers or dealers, every honorable preventive of such an abuse shall receive from us a hearty support. If the honest manufacturer finds it to his profit to obtain a trade-mark which shall distinguish his goods from rivals of an inferior make, why should not the honest dairyman, as well as the honest manager of a creamery or cheese factory, find a like practice proportionately profitable? We are therefore decidedly in favor of a bill now before the Legislature of this State the object of which is to enable any dairyman to assume for his goods a trade-mark which shall be distinctive and which no one will have a right to erase or the liberty of imitating without incurring legal penalty—the privilege of taking such a mark to be confined to full-milk and genuine dairy goods. The honest dairymen of every State in the Union might profit by such a measure.

LAST week we mentioned the project of the "Freedmen's Oklahoma Association," of St. Louis, to settle 10,000 freedmen in Oklahoma with a promised grant of 160 acres to each adult settler. A telegram from Washington announced last Thursday that the Commissioner of the General Land Office had pronounced the project illegal—a decision about which there could be no reasonable doubt from the start. J. Milton Turner, Ex-Minister to Liberia, the head of the enterprise, might easily be engaged in a more reputable business than this attempt to illegally intrude an ignorant crowd of his race, without business training or capital, into a wild waste where poverty and disaster would certainly await them, even if they succeeded in evading or overcoming the United States forces that must bar their way. When Captain Payne, a few months ago, attempted to start an "Oklahoma boom," we strongly reprobated the projected occupancy of the Indian Territory, and we are not a whit more tolerant of misconduct in a colored "man and brother" than in a white man. The Government prevented the intended outrage by the former, and there is little fear of its intention and ability to prevent that by the latter.

FORTY POUNDS OF BUTTER A WEEK FROM ONE COW are reported to be sold by a petty farmer who owns only a single bovine near Elgin, Illinois. Jersey Belle of Scituate is said to have given 705 pounds of butter a year, and Eurotas, 778 pounds in eleven months and six days, while Gold Thread is modestly credited with 18 pounds a week, but what are these reported yields to that of this nameless Western marvel! Forty pounds of butter a week from a single cow! Great Milky Way!! It is also reported, however, that this "owner of one cow" buys butterine at the rate of about forty pounds a week, and, judging from the alleged practices of some of his neighbors, it is more than suspected that his large weekly sales of butter are connected, otherwise than through the cow, with his large weekly purchases of butterine. Indeed, it is currently reported East and West, and in the intermediate country, too, that "honest," "simple" farmers are among the best customers of the manufacturers of butterine and similar concoctions. Of course, the number of rural rogues who palm off such stuff on their customers as genuine butter must be comparatively small, but, inasmuch as they are dishonestly injuring their own class and calling, every legal penalty should be more stringently enforced against them than against other rascally dealers in bogus dairy products. The Green Mountain State is not the only one in which the cat-o'-nine-tails should make intimate acquaintance with the bare backs of such rascals.

A NEW DANGER TO OUR CATTLE.

A CABLEGRAM from Liverpool, on April 28, announces that foot-and-mouth disease has just been discovered among the cattle landed at Birkenhead from the British steamer, Lake Manitoba, which left Portland, Maine, on April 16th and arrived in the Mersey on April 26th. As this disease, owing to its extremely contagious nature, is more dreaded than any other by English farmers, stringent precautions, we are needlessly told, were at once taken to prevent it from spreading. During the last six months we have heard of a couple of cases in which this disastrous disease was supposed to have made its appearance among our native cattle; but in each instance investigation decided that the report was unfounded and, a short time back, Professor Law, our best veterinary authority, wrote a lengthy article proving that no well authenicated case had ever been found here. A few months ago we announced the arrival at this port of a herd of infected Jerseys which were quarantined on the discovery of this disease among them. Have other infected animals brought from the United Kingdom or the Continent, been allowed to pass without having been subjected to the detention authorized by law? We have had occasion, more than once, to censure the carelessness shown in such matters, and if the disease is in reality among our herds, its presence there *must* be due to this carelessness. But is the disease here? Mindful of the nature of the evidence on which the existence of pleuro-pneumonia among imported American cattle was announced at Liverpool two years ago, and also of the eagerness of the British agricultural interest to discover some pretext for the enforcement of a more stringent embargo on importations of live cattle from this country, we are not prepared to accept the announcement of the Birkenhead veterinarians as conclusive proof of the nature of the malady discovered in the shipment by the Lake Manitoba. Should their diagnosis prove correct, however, and should the disease have really established a foothold among our herds, it is not improbable that a vigorous agitation will be promptly started across the Atlantic looking to the entire exclusion of importations of live cattle from this country. Considerable as would be the consequent injury to our cattle interests, it would be a mere trifle in comparison with the loss from the spread of the disease among the vast herds throughout the country.

SORGHUM.

WITH regard to the several kinds of sorghum illustrated in our pages this week, little can be said as to their relative value for the production of sugar and sirup in the Middle and Northern States. The sorgho industry has not yet progressed far enough. Experiments are needed. Though none may prove better than the well-known "Minnesota Early Amber" or the "Orange" cane, yet further crosses may show that there is a wide margin for further improvement. The relationship of these canes to what is variously known as Dhouro, Durra, Doura, Guinea Corn, Jovaree (in India), Nagar (in China), Chicken Corn, Rice Corn, Egyptian Rice, etc., is very close. That illustrated—on page 302—with a drooping panicle, is evidently a variety of Sorghum cernuum which itself is probably a variety of S. vulgare. The spreading, compact, large or small, upright or drooping forms of the heads, as represented, are not sufficiently distinctive to entitle them to be considered distinct varieties, much less species, since we have seen in our own plants, raised from the seeds of the same head, differences approaching to those which appear in the engravings. We may therefore presume that this common sorghum varies the same as Indian corn varies or perhaps even to a greater extent. The different sorts also vary greatly in saccharine properties. Most kinds sent up but one stalk from a seed, though it often branches, developing several seed heads differing in size from the smallest of those illustrated to a foot or more in length and weighing two pounds. Heads of this weight are not unusual in California, a specimen of which lies beside us, sent to this office by Mr. Saunders of that State.

The saccharine properties of the variety which we have called the Rural Branching Sorghum are not ascertained. The surprising amount of stalks and leaves produced from a single seed would, however, give it the preference over all other tried kinds even though less rich in sugar; while for ensilaging we know of no other forage plant that promises to be of more value since in this climate it may be cut twice and thus produce a heavier yield than any of which Indian Corn is capable. That, also, it will luxuriate on poor soils; that the stalks are rarely (never, we should say) broken or lodged by the wind, and that they are sweeter, less woody, more succulent than those of maize are further items to its credit. The only item to its debit that we have been able to discover is its sluggish growth in the early part of the season and the necessity, therefore, of raising it upon clean land. We shall await with a keen interest the reports of the thousands to whom we have sent trial packets.

NO MEDDLING WITH THE TARIFF ON WOOLS.

THE United States Supreme Court recently decided that imported worsted stockings are legally liable only to a duty of 35 per cent. on their value, instead of the compound duty of 35 per cent. on their value and 50 cents a pound on their weight, which had previously been charged on them according to rulings of the Treasury Department. Basing its action on this decision the Treasury Department, under date of March 29, issued a circular directing Customs officers in future to assess duties of only 35 per cent. *ad valorem*, instead of 35 per cent. *ad valorem* and 50 cents per pound, on what are technically known as "knit goods," including caps, gloves, leggins, mitts, socks, stockings, woven shirts and drawers, and all similar articles made on frames, of whatever material they may be composed, except silk and linen. This ruling has given rise to a great deal of well-founded agitation among the manufacturers of this class of goods in New England. They say that the removal of the 50-cents-a-pound tax on imported articles will enable foreign countries to undersell them in our home markets, and that, should the ruling be maintained, they will have to sacrifice their establishments here and go to Canada to make their goods, because there, owing to the low price of the materials, they can manufacture the wares so much more cheaply that by importing them into this country they can make a much better profit, after paying the import duty of 35 per cent. *ad valorem*, than could be realized by manufacturing the goods here. They insist that the great cost of such goods made here is mainly due to the high tax—averaging 70 per cent.—on all imported fine wools entering into their production, and that nearly all the wool employed in making "knit goods" is foreign, and most of it necessarily so, owing to the inadequate supply of domestic wool of that sort.

They declare that they cannot continue to give employment to thousands of hands in this country unless either the former tax on imported knit goods is reimposed, or the duty is lowered on the imported fine wools necessary for their manufacture. The Supreme Court's decision related to worsted stockings only, and there is grave doubt whether it covered other sorts of knit goods, as the Treasury Department has assumed. Owing to the vigorous remonstrances of the manufacturers, the Secretary of the Treasury has suspended his late ruling and will give a final decision on the question in a few days. Should this decision admit the goods at the lower rate of taxation, then we insist that the tariff shall be promptly revised in the direction of imposing a heavier duty on imported knit goods, for we cannot for a moment consent to any lessening of the duty on imported fine wools to the injury and discouragement of American wool producers. Many of the political papers are urging such a measure, and their arguments are not without weight, but they would be equally powerful if directed against any form of protective tariff, and so long as this exists we shall insist that it shall protect the wool raiser as well as the wool manufacturer.

BREVITIES.

FROM good seeds only can good crops grow.

THE Army-worm has been found at the Rural Farm and in its neighborhood several times during the Winter.

THOSE about to plant our Argenteuil and Dutch asparagus seeds are advised to read Mr. Goodell's note in another column.

POA ANNUA, the Dwarf or Early Meadow Grass, blooms this year April 23d. This can never become valuable for pastures, we presume, but it is the first to lighten up lawns in the early Spring.

BEES should be high-priced this season, as the past Winter has destroyed a great number of colonies in all parts of the country, according to a large number of reports gathered from a multitude of our "exchanges."

ONE oleomargarine dealer declares that good oleomargarine is better than a medium grade of butter. Well, why not sell it as oleomargarine and color it blue, red, green—anything but golden yellow. Then it would have a fine chance to popularize itself upon its own merits.

IN the monthly report of the New York Horticultural Society for April appears an interesting essay on the cultivation of mushrooms, by Mr. Samuel Henshaw. We regret that we cannot find space to republish it in our columns. It is probable that the obliging Secretary, Mr. James Y. Murkland, 12 Cortland Street, N. Y., would furnish copies to those of our readers specially interested in mushroom culture who apply, inclosing stamp for postage.

THE American farmer has gained as a dairyman the trifle he has hitherto lost as a hog-raiser by the European trichinosis scare. With short rations of American pork our trans-Atlantic customers are bound to have full rations of American cheese—hence a large increase in our exports of that commodity. During the month of March our exports of it were worth $455,562 against $196,450 in the same month last year, and for the three months ending March 31 we sent abroad the worth of $2,358,472 against, $1,458,200 in the same period in 1880.

LAST year the appropriation made by the Legislature of this State for the support of the State Fish Commission failed for lack of the Governor's approval, and we expressed our regret at the unwise policy that withheld it. The same misfortune is likely to occur again from the same cause this year, and regard for the best interests of the farming community as well as of the public at large, makes us still more emphatic in disapprobation. Rarely has public money been appropriated to an object so beneficial to the people as in this case. If properly supported, the labors of the Commission must soon render large tracts of unproductive water as profitable, acre for acre, as the richest land, and add to the diet of the people in all parts of the State a healthful and palatable variety of food. Strong advocates as we are of the most rigid economy with the people's money, we are decidedly of opinion that a failure to grant the present appropriation would be an unwise and short-sighted parsimony.

IN the struggle between the American Hog and the governments of Europe the American Hog is very likely soon to prove victorious through its own multitudinous merits, the vigorous diplomacy of its friend, Secretary Blaine, the good sense and love of its trans-Atlantic admirers and the rashness and inconsiderateness of its trans-Atlantic defamers and antagonists. Already the French lovers of good pork are "crying for" the American article and vilifying their government, as only Frenchmen can, for having deprived them of the luxury. Already Austria has been taken sternly to task for excluding hog products from this country, while admitting those from other lands, despite the treaty obligations to place this country, commercially on the same terms as the "most favored nation." Hints at claims for damages to our trade through violations of treaty obligations may soon become demands, not with regard to Austria alone but other countries also that have in the same way rashly declared war against the American Hog.

LAST Thursday that dignified body, the Senate of this State, grew really unbecomingly hilarious over what was facetiously styled a bill about "Bugs and Humbugs." For years it has been customary to put into the Supply Bill an appropriation for the work of an entomologist in the State Museum of Natural History at Albany. The duties of the position have for a long time been quietly performed by Professor Lintner, and to make the position permanent a bill was this year introduced by lawyer Fowler providing for the office of State Entomologist with a salary of $2,000 per annum. Seldom has an appropriation of $1,000,000 aroused such a manifestation of feeling. Lawyers, manufacturers, store-keepers, and all the nondescript tribe of "politicians" began at once to harangue vociferously, if not wisely, on the agricultural interests of the State, while some of the veteran leaders of the Senate, according to immemorial custom whenever the welfare of the farming community is discussed, showed their wit and humor by appropriating antiquated jibes and stale jokes about entomology, its multitudinous classifications, sesquepidalian nomenclature, bifalutin' pretensions and inadequate performances. Finally, the debate waxing personal and political, agriculture and its needs were forgotten, and the bill was shelved. What a fuss is always made over any trifling agricultural appropriation, not in this State alone but in others also and by the General Government, while millions are constantly voted for all sorts of other purposes without a murmur!

*A DREAM OF PARNASSUS.

The Era of Cheap Books, and what the Immortals think about it.

I slept where the moon, serenely bright,
Shone full in my face through a Summer night;
I dreampt I was in a Land of Light,
With Fielding and Moore and Shelley and White,
And Shakespeare and Milton—a goodly sight!—
With Addison, Dryden, and others, quite
Too numerous to mention;
And there the worthies, one and all,
Whom we the "classical authors" call;
Beneath the shade of Parnassus tall,
On Pegasus Place, in Helicon Hall,
Were holding a big convention.

Virgil was sitting beside Voltaire,
Boccaccio chatting with Dumas, pere,
And Pope curled up in the corner there,
While old Sam Johnson was in the chair,
Wall-eyed and grim, with carroty hair,
And he said, "Of course you are all aware,
Of the latest earthly advices:
The publishers seem to be going to smash
Beneath the great 'economy' lash,
For the Book Exchange is cutting a dash
Exceedingly reckless and awfully rash
In selling for almost nothing for cash,
And ruining regular prices!

I hold in my hand a letter from four
American publishers who feel sore,
And they speak for a score, or possibly more,
Who live by a traffic in printed lore,
I read: 'We pray from this earthly shore—
Ye authors of old attend us!
O, give us a lift in this hour of need,
For the publishing business is going to seed;
The Book Exchange is making with speed
As many books as the folks can read,
And selling disgracefully low, indeed;
It cheapens your fame—for you we plead!—
Ye talented ghosts, defend us!'"

"What word shall we send to this earthly band?"
Then Scott, with GOOD LITERATURE in hand,
Arose (Amid cries of "Take the stand!")
And said, "This scheme will possess the land;
No good is the Harper or Scribner brand.
While Alden shows that he can command
The brains of sage and scholar:
A shilling for Pope—good binding on;
The same for the poems of Tennyson;
Six cents for your Pilgrim's Progress, John;
For the Iliad, thirty cents; and Don
Quixote for half a dollar!"

Then Chaucer said, "I am rather old,
But I am mighty glad this day to be told
How cheap my Canterbury Tales are sold,
And the poets and wits of the Queen Ann fold,
Steele the bright and De Foe the bold,
Berkeley the sober and Swift the scold,
From the time of Sir Walter Raleigh;
Shakespeare's works, and Smollett's and Sterne's,
Bacon, Bollingbroke, Byron and Burns;
And Babington Lord Macauley."

Charles Dickens said, "'Twould be foolish to let
Good luck of mortals cause regret;
For the price of a theater-ticket they get
Milman's Gibbon—the perfect set—
Dante and Virgil, two shillings net,
For a dollar Adam Smith on Debt,
And Mill on the Laws of Nations;
And I see by this wondrous circular
Set up by the Book Exchange that for
Three cents you get the Seven Years' War
For a dime King Henry of Navarre,
And for thrice the price of a good cigar
Will Shakespeare's inspirations."

Then Goldsmith rose and expressed it thus:
"It is simply a case of de gustibus,
But I see no reason for all this fuss,
For publishers never did much for us,
While needy, Summer and Winter;
Therefore, confreres, I hold this view:
The high-price houses are doubtless blue,
But unto the man our thanks are due
Who sends our thoughts each palace through,
And into the humblest cottage too,
For the Many are always more than the Few
And the People are more than the Printer!"

A slight shade rose—'twas Edgar Poe—
Who said, "I've been talking here with De Foe;
We agree, and the ancients have told us so,
That who makes two printed leaves to show
Where only one did formerly grow
Is as good a man as we want to know;
And this letter here, from the realms below,
Reveals its earthly animus;
I move it be not received!" About
A thousand voices removed all doubt,
Ben Johnson and Halleck and Hood spoke out,
Kit North and Irving and Father Prout,
'Mid a storm of cheers and a mighty shout,
And the motion passed—unanimous!

* This unique production is from the pen of one of the most widely celebrated of American humorists, who, in this case, seems disposed to add to his fame by assuming the even more widely known name, "Anonymous." The Manager of the American Book Exchange wishes it to be distinctly understood that he is not responsible for either the titles, rhymes, or price! The far-sighted poet who is able thus to report the convention on Parnassus has, perhaps, also had a vision of some future catalogue and got the facts mixed with announcements already made. A corect catalogue of our present list of publications may be had upon application to the Headquarters of the Literary Revolution, No. 764 Broadway, New York.

[Louisville Home and Farm.]

Frank O. Herring, Esq., of the Champion Safe Works 251 and 252 Broadway, New York, reports the use of St. Jacobs Oil for a stiffness and soreness of the shoulder, with most pleasant and efficacious effects.

Scientific and Useful.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN NO. 55, APRIL 5, 1881.

543. Night soil. Received March 15th, from William Burr, Fairfield.

This sample represents the material gathered from village privies during cold weather in the Spring season. For comparison the analysis of a sample from a large quantity taken in the village of New Canaan in 1859 is given.

Chemical Analysis of Night Soil.

	Fairfield. 543.	New Canaan.
Water	53.06	66.74
Organic matter*	14.62	17.68
Sand, soil and coal ashes	29.76	8.59
Potash	.21	.65
Soda	.26	
Lime	.82	2.27
Magnesia	.60	
Iron oxide and alumina	1.79	3.69
Phosphoric acid	1.41	1.38
Sulphuric acid	.39	
Chlorine	.08	
	100.00	100.00
*With nitrogen	.74	.87

No closer agreement could be expected in two samples of this material than is seen in the above analysis. The larger quantity of lime found in the New Canaan sample might have come from a sprinkling of oyster shells or the like. The large admixture of sand, soil and coal ashes is what can hardly be avoided.

The most valuable fertilizing elements of the night soil, viz., nitrogen, phosphoric acid and potash, may be bought in other forms for 20 cents, 9 cents and 7 cents per pound respectively in the fertilizer market. The highest commercial value of these ingredients in 100 pounds of night soil, 543, is as follows:—

Nitrogen	0.74 x 22½ cents	= 16.6 cents.
Potash	0.21 x 7 "	= 1.5 "
Phosphoric acid	1.41 x 9 "	= 12.7 "
Total		29.8 "

The other substances present do not materially add to the value, and the commercial worth of the night soil is not more than 30 cents per 100 pounds, or $6 per ton, on the most favorable reckoning.

Maize Ensilage.

Sample sent by B. C. Platt, of Suffield.

ANALYSIS.

	Fresh.	Water-free.
Water	82.09	
Ash	1.04	5.84
Albuminoids	1.27	7.07
Crude fiber	5.76	32.15
Free acid*	0.66	3.69
Nitrogen-free extract	8.84	49.34
Fat	0.34	1.91
	100.00	100.00

* Calculated as acetic acid.

BULLETIN NO. 56, APRIL 15, 1881.

549. Bone saw dust, manufactured and sold by the Holyoke M'f'g. Co., Holyoke, Mass.

550. No. 1 Peruvian guano, sold by Seth Chapman, 170 Front Street, New York.

551. Tortoise-shell sawdust, manufactured and sold by F. S. Johnson, Plainville, Ct.

All the above were sampled and sent to the station by J. W. Hemingway, Plainville, Ct.

	549.	550.	551.
Nitrogen	3.72	5.57	14.72
Soluble phos. acid		3.22	
Reverted phos. acid		4.23	
Insoluble phos. acid	25.67	8.62	trace.
Potash		2.40	
Estimated cost per ton	$41.00	$50.15	$32 38
Cost at Plainville	$37.00*	$60.40†	$30.00

—*At Holyoke, $35.00 per ton.
—†At New York, $2.90 per 100 lbs. =$58.00 per ton; at Plainville, $3.03 per 100 lbs.

Peruvian guano, as sold here three years ago under guarantee, was an excellent and cheap fertilizer, as that could be depended upon when purchased from agents of the Peruvian Government. Now the case appears to be otherwise. The Chincha Island high-grade deposits are exhausted and the material that is now put upon the market is of variable and often of inferior quality.

The complete analyses of the sample 550 is as follows:

Organic and volatile matter	29.77
Sand and insoluble matter	10.15
Iron oxide	1.08
Lime	13.58
Magnesia	2.10
Potash	2.40
Soda	11.39
Phosphoric acid	16.18
Sulphuric acid	8 14
Chlorine	6.75
	101 54
Deduct oxygen equivalent to chlorine	1 54
	100.00
With nitrogen	5.57

S. W. JOHNSON, Director.

Veterinary.

PREVENTION OF CONTAGIOUS DISEASES OF ANIMALS.

D. E. SALMON, D. V. M.

BEFORE active measures can be adopted for the prevention of a disease, it is very plain that we must know its nature, we must know if it is contagious; we must know how the germs are scattered, how they are preserved, how taken into the system, how destroyed and how to enable the animal body to resist them. Without such knowledge it is absolutely impossible to make headway against a disease; and with it we must employ rational measures based upon it before practical results are obtained. When a person is sick we call a physician, learn the nature of the disease and receive a prescription with directions for treatment, but the patient is not benefited unless the directions are carried out.

So with contagious diseases of animals: hog cholera has been demonstrated to arise by contagion, and preventive measures founded upon the nature of that contagion have been recommended, and if these recommendations are not put into practice, it certainly can be no more the fault of those who made the investigations than the refusal of a patient to take medicine is the fault of the physician who prescribes it. And yet only a few weeks ago, Mr. L. B. Wing, President of the Ohio State Board of Agriculture, in an address at the Inter-State Agricultural Convention on Contagious Diseases of Farm Stock, is reported, on good authority, to have said:

"I haven't much faith in the present financial value to the farmer of the work of the scientists. Various learned gentlemen have been appointed, from time to time, to investigate the causes of and suggest a remedy for the hog cholera. Their researches are probably of interest to themselves and to science, but if there has been any abatement in the losses from this cause, it is not in the least degree to be attributed to anything they have suggested. So in this matter of diseased cattle, it is proper that these gentlemen should investigate the nature and cause of the disease; but it will require strong practical and what physicians call 'heroic' treatment, to rid ourselves of this scourge."

What are the facts in regard to hog cholera? Why, before the investigations of 1878, there was no certainty that hog cholera meant any particular disease, and many of our leading agriculturists contended that pneumonia, enteritis, dysentery, charbon and many other diseases were all classed together as cholera, and that this term was simply the expression of the losses from all the various diseases to which swine were subject. Agriculturists were widely divided as to the existence of any contagious disease to which the name cholera was applied. In other words, the general knowledge of this subject was so slight as to discourage the most simple precautions towards preventing the ravages of a contagious disease.

Now who can doubt, from the results of these investigations, that the great majority of deaths among hogs in the various parts of the country, is caused by one and the same disease, and that that disease is intensely contagious? Further, it is shown by these investigations that this disease generally, and probably always, results from contagion; that in a number of States, it was never known till introduced from infected districts.

Are such facts as these of no financial value to the farmer? Is it possible that since the contagiousness of this disease has been made so apparent, our large hog raisers have not profited by the suggestions to separate the healthy hogs from the sick ones and place the former on grounds that are not infected? Is it possible that no precautions have been taken by the owners of healthy herds to prevent the sick animals of neighboring farms from mixing with or coming near them? I cannot believe that our intelligent American farmers have so neglected their interests. But suppose Mr. Wing is right; is the work of the scientists of any less value because their suggestions have been in no respect heeded? A general plan was marked out for exterminating the disease from the country, but as the first step has not been taken to test the practicability of that plan, I cannot see how its value can be so readily determined.

Turn to cattle diseases, if you please, and how could "heroic" measures be adopted without the assurance from scientists that pleuro-pneumonia is a contagious disease; that it arises exclusively from contagion, and that the virus in stables may be destroyed by certain agents known as disinfectants? And who but scientists are able to go into a stable where there are chronic cases of pleuro-pneumonia and unerringly pick out the affected and dangerous animals, though their coats are glossy, their general appearance and appetite good, and their yield of milk from ten to fifteen quarts a day?

And yet Mr. Wing hasn't any faith in the financial value of such facts, nor does he believe that the abatement of such diseases is due to any suggestions of the scientists. Mr. Mr. Wing may honestly hold such views; there are some things that cannot be accounted for, but it is hardly possible that any considerable number of intelligent farmers coincide with him.

The Apiarian.

KING BIRDS AND BEES.

THAT sap sucking question started by Gen. Noble reminds me of a mystery which unaided I have been trying to solve. A friend of more experience than myself remarked that the king birds did no harm to the bees as they caught only the drones. After watching their operations a few days, I resolved to get at the bottom facts, and with gun in hand I brought down a bird then busily engaged in intercepting bees as they were returning to the hive; transferred the same to a dissecting table, but was much surprised to find neither drone nor worker stored away in its crop. Repeated examination resulted in the same way.

Now is its digestion so powerful that all traces of a bee disappear in a few moments after being taken, or does it give the bee one loving embrace for the good that is in it and cast its lifeless body to the ground? C. L. S.

We are of the opinion that the king bird catches not only drones but workers and queens also. Examination of the king bird's crop scarcely ever reveals the presence of bees except in such a condition as to be quite beyond identification. A gentleman once noticed a king bird catching bees and, on close observation, saw small particles drop to the ground which proved to be both the bees' extremities, and he concluded that the bees were caught in such a manner as to secure the honey-sac only. If this be true, search for bees in the king bird's crop would be in vain.—EDS

Literary Miscellany.

A VOICE OF SPRING.

WHEN in early Spring the branches
Don their livery of green;
When amid the springing grasses
Early violets are seen;
When each bird and bough and blossom
Brimming over with glee—
Voices of the early springtimes,
Hours of sadness bring to me;
And I dream of other springtime,
And a day of long ago,
When beneath the open window
Little feet went to and fro,
When amid the dreamy silence
Came a step upon the stair,
Came a sudden gleam of brightness
From a baby's tangled hair;
Then a shower of blossoms
And a laughing voice said low:
"Violets are blossomed, sister,
And I knew you loved them so!"

Spring has come again—the meadows
Dotted are with violets blue,
But a little voice is silent
And a little heart so true,
Underneath the early blossoms,
Slumbers all the springtime through.
Thus when bird and bough and blossom
Brimming over seem with glee,
Voices of the waking Summer
Hours of sadness bring to me;
For each waking bird and blossom,
As I listen whispers, low:
"Violets are blossomed, sister,
And I knew you loved them so!"

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

CHAPTER XV.

(Continued from page 294.)

Having arrived at the barn the sheaves were rapidly unloaded on an elevator, which was also a drier, and in their passage up and across this they were thoroughly deprived of moisture. A threshing machine received them from the elevator, and the straw, being threshed and bound again without the direct aid of human hands, was borne away to its appropriate quarter, while the grain, thoroughly winnowed, was carried down by a shute into the granary.

Grass was treated in a similar manner, being taken directly from the mower, artificially dried, and stored in the barn without having once touched the ground.

This is but a sample of the labor-saving and time saving methods by which farming industry was carried on in this country. Every new operation which I saw was a fresh source of wonderment to me at the marvelous perfection and ingenuity which was displayed in the construction of the implements and machinery for carrying on the work of the farm. While the completeness of arrangement in the farm buildings and in the ground alloted to each crop seemed to indicate that convenience had become a veritable art among this people.

The farm buildings were located by the side of the railways, which divided the section into two equal parts. They were built most substantially of stone, and like the houses, they were fire-proof. There was a barn appropriated to each variety of grain, one to the hay intended for city use; the other to that to be consumed on the farm. Connected with this barn were also the stables where the animals of the farm were confined. There was a building appropriated to the storage of vegetables, and a most wonderful house for preserving fruit. This art had arrived at such a degree of perfection among this people that the season of every variety of fruit was perpetual, and the fruit itself had every desirable quality developed to perfection, while there were many most excellent varieties among them which are entirely unknown to us.

The amount of fruit consumed by this people was truly marvelous, which is not strange when we reflect that a dish of strawberries, cherries, peaches or grapes could be had for the asking every day in the year. It was fruit at breakfast, fruit at lunch, and fruit at dinner. In fact, fruit was the universal and only dessert among this people.

I must not forget to mention the building which was appropriated to domestic fowls. It was most complete in its appointments, a regular palace for its kingly and queenly occupants. Kings or queens every one of them would certainly be among the best bred fowls which are known to us. I wondered why the art of singing was denied them, they looked so beautiful, yet I fancied that there was something superior in their crow and cackle to correspond with their high breeding.

The cows, the sheep, in fact, all the domestic animals of this country were perfect models of beauty and utility. The cows in particular attracted my attention. They were the only animals which were raised to any extent in this part of the country. Sheep were raised almost exclusively in the mountainous districts, and horses being used chiefly for driving, there were few required among the farmers, while the race of swine which are the source of so large an industry among us, I found entirely extinct among this people. Each section being the source of milk and butter supply to its particular ward in the city, quite a herd of cows became a necessity to it, and such wondrously beautiful, gentle and high bred creatures it had never been my pleasure to look upon. When I came to see them milked, stood amazed at the quantity of this fluid which was drawn from them, no less than at the manner in which it was drawn.

One man had charge of the cows at the milking. There was a pail for each cow, or rather a tub, for it was twice the size of an ordinary milk-pail. These

were tightly covered with a sharply sloping cover through which four India-rubber compressors protruded which were operated by a little implement directly under the cover that was wound up like a clock and gave the necessary motion to the compressors. A pail was set under each cow in turn, the compressors were adjusted to her teats and set in operation. By the time the last cow was reached the first one was milked, and so nicely were the cows trained that when their milk was completely drawn from them they would step aside, leaving the tub sitting where it was placed.

Thus when the attendant had adjusted the milking machine to the last of the ten cows, all he had to do was to go back to the first and collect the milk from each in turn. The milk-house was near the stable and there the milk was taken at once and disposed of. That which was intended for the city was placed upon a platform which was so arranged that it could be submerged to any required depth in a spring of the coldest water, while the butter and cheese milk had each a room appropriated to them, where it was cared for in a manner which to my mind was high art as compared with the manner in which butter and cheese are commonly made in my country.

Lest I weary the reader, I will conclude my observation on the wonderful farming of this country by some statistics which will give an idea of the productiveness of the soil, and the high condition of every department of this industry among this people. On reflection, however, I know that I would not be believed by one in ten of my readers, and as I have an inborn disinclination to talk to the incredulous, I will let the matter pass.

CHAPTER XVI.

A TRIPLE WEDDING.

SOCIAL life in these little farming communities was as pure, refined and exalted as it was possible for it to be. We naturally look to the city for culture and refinement, and we expect to discover in the people of the country more or less of unsophisticated simplicity of manners, together with a want of familiarity with the progress of events in the world at large. But though I was ill qualified to pass judgment in these matters, I could not discover that the people of the country were one whit behind those of the city either in refinement of their thoughts and feeling, or the accuracy and extent of their information on every subject which could interest people of culture and intelligence. While their social intercourse was marked by a thoughtful regard for each other's feelings and a spirit of obliging and self-sacrificing interest in each others welfare and happiness to which even the courtesy and good feeling among the people of the city, which had so won my regard, seemed somewhat stilted and formal. This was probably owing to the facts that society in the country was more circumscribed, more isolated and that it was bound together by a community of interest which did not exist among the people of the city. Moreover, communication between city and country was both rapid and complete, and the expense of traveling was ridiculously small, so that the people made frequent visits to the city and thus familiarized themselves with city life and the many objects of interest which are to be found only in the great centers of population.

It was my good fortune while here to witness the marriage of three fair daughters of this happy little community. It seems that in this country marriage days come quarterly like some church ordinances in my own. It is customary for the minister to remind the people of the approach of marriage day, when it is at hand, and to request that any who desire to be united in the bonds of wedlock may present themselves on that occasion. From this it will be understood that the marriage ceremony is always performed in the church.

I have read a burlesque on the parade which is usually made over the marriage ceremony in my country, where Jane, who is washing when the minister arrives, dries the suds off her hands on her apron, and runs out to find John, who is working in the field. They stand up at once and are married, and as soon as the ceremony is over Jane returns to her wash tub and John goes back to his plow.

The marriage ceremony in this country is not characterized by the rude simplicity which is here portrayed, but it is simple enough when compared with the display which is usually made over it among the people of my own land.

If there is a marriage to take place, when the day comes round the people assemble in the church. The couple, or couples—for sometimes four or five couples are united on the same occasion—arrive at the appointed hour, dressed in their ordinary best suits, and accompanied by the relatives of each. They are welcomed by a chant from the choir, which recounts the joys of domestic life.

In the ceremony which I witnessed the three couples stood up before the desk of the minister after the chant was finished, while he made a brief address to them on the nature of the obligations which they were about to assume. Then, addressing himself to each couple separately, he repeated a form of vow to which they severally assented, whereupon he pronounced them husband and wife. Then invoking the Divine blessing on the new relations which they had assumed, the ceremony was concluded.

The organ now pealed forth a joyful air, and the choir sang an appropriate selection while the newly-married pairs marched down the aisle, followed by the relatives who formed their respective households. First their parents, second their grandparents, third their great-grand-parents, and fourth their parents of the third remove.

This was to me the most touching and interesting part of the whole affair. The parent rank was full—six stalwart men in the prime of manhood moving by the side of as many noble women. The grand-parent rank was full, though a generation had whitened their hair somewhat, but had not taken from their lively expression of countenance, their erect carriage, nor their elastic step. The great-grand-parent phalanx, upon some of whom time seemed to have begun to press heavily, was also full, save one—an old dame, whose face looked peculiarly sad and pensive, moved down the aisle with a vacant place beside her. Of the great-great-grand-parents there were but three, two women and a man. Bent in form, feeble in step, and oppressed with the infirmities of age, it seemed a matter of no little effort for them to hold their place in the procession.

What a picture of human life, thought I, is here presented! Surely, human existence in the present world, is but a procession in which those who have marched longest, fall farthest to the rear, while the young and vigorous ever occupy the van, instructed by the wisdom and profiting by the experience of those who must soon be left behind to death and forgetfulness.

Upon reaching the side-walk, the brides and grooms were met by a company of children, who scattered beautiful white flowers before them, as they led the way to the pavilion, at the entrance of which the newly wedded pairs stood and received the congratulations of the whole populace, who had followed them from the church. A simple lunch was here spread out, of which all the people partook, and the remainder of the afternoon and evening was spent in social enjoyment. Promptly at nine o'clock the chimes from the village church rang out, and the hymn of praise being sung, the company dispersed, and the bridegrooms led their brides away to their new homes

"Is this all there is to your weddings in this country?" I asked Mr. Glinden, as we walked homeward.

"Is'nt it enough?" he asked in reply. "What more is necessary?"

"Why, in my country," said I, "this would be thought a very tame affair, even for a single wedding, but for a triple one it would be regarded as niggardly, indeed.

"In the first place, among people of social standing, the groom would be richly dressed, and the bride would be arrayed in the most expensive apparel. She would be accompanied by from two to six bridesmaids, in like manner, expensively dressed, while all the relatives and friends of the couple would make it an occasion for a grand display of jewels and costly clothing. There would be an expensive feast when the ceremony was over, a great wedding cake, and dishes rare and rich, which no skill of such a little village as this could supply, but which must be the work of some experienced artist of the great city. Then there would be an array of imported waiters to serve the feast, and an imported band of musicians to supply another prominent feature of the occasion. The bride would also be the recipient of costly wedding presents. And after all this ostentatious parade was over, the couple would make a wedding tour of one or perhaps several weeks before settling down to the joys of home and wedded life."

"I remember of reading about old-time weddings," replied Mr. Glinden, "which were even grander than your description, and I must confess that to my mind, such expensive displays are an evidence of a no very flattering degree of mental development in the people of that time. They show a regnant vanity and love of applause which are unworthy the true dignity of man's nature, because their gratification is sought in the pomp and parade which only wealth can give. They also had a tendency to induce a popular sentiment in favor of costly display on these occasions which had an evil effect on many a young couple who could ill afford to do it.

To be continued.

NEW PUBLICATIONS.

Down South.—By OLIVER OPTIC. The fifth and last volume but one of the "Great Western Series." Boston: Lee & Shepard.

This narrative continues the history and experiences of the young yachtman and his Western crew into the "land of flowers," and although the action of the story is confined entirely to Florida, the resolute, straightforward hero and his companions appear as much at home as though sailing on the blue waters of Lake Michigan. Some new characters are introduced and share in the excursions and adventures of the party on the St. Johns River, Ocklawaha and Indian Rivers, besides a trip to the Lake country and shorter runs up the smaller streams of the State. The story is made interesting by numerous incidents and bits of information pertaining to the country. Some successful alligator shooting, and an attempt on the young captain's life, are facts noted in the adventures.

How we Fed the Baby.—By DR. C. E. PAGE. New York: Fowler & Wells, Publishers.

This little book will be welcomed by many mothers. As the health, growth and happiness of the child depends greatly upon the proper care of its digestive organs, all information tending to throw light upon this subject should be appreciated. Many children, no doubt, suffer unmeaning torture from those most deeply interested in them, occasioned by ignorance of necessary laws of health. The experience of the author will serve to instill the spirit into parents' minds, which, in all probability, will develop into a degree of practice.

Poems of Many Years and Many Places. By Wm. Gibson, Commander U. S. Navy, Boston. Lee & Shepard, Publishers. Price $1.50.

This little volume has been preceded by "A Vision of Fairy Land and Other Poems," by the same author.

The first impression received is of the tastiness of its binding. Further examination presents (as the title suggests,) a diversity of poetical subjects. Repetition of thought is happily avoided in this little casket of literary gems.

The Longfellow Birthday Book.—Arranged by CHARLOTTE FISK-BATES. Boston: Houghton, Mifflin & Co. $1.25.

The exterior and interior of this little volume invite the eye and mind to more than a passing notice. The illustrations serve to increase its attractiveness, being pretty embellishments of its pages. A fitting souvenir for a birthday gift.

For Women.

CONDUCTED BY MISS RAY CLARK.

ARBUTUS.

JOHN G. WHITTIER.

I WANDERED lonely where the pine trees made
Against the bitter east their barricade,
And guided by the sweet
Perfume I found, within a narrow dell,
Amid dry moss and dead leaves at my feet,
The trailing spring flower, tinted like a shell!

And bending o'er it not irreverent
I thought of lives thus lowly clogged and pent
Which yet found room,
Through daily cumberings of deep decay and deaf,
To give to heaven the sweetness of their breath,
And to the earth the beauty of their bloom.

"GATHER UP THE FRAGMENTS."

MARGUERITE.

"There, you pretty purple worsted, I've saved you every stitch,
For if we are wasteful, we never can get rich."

These lines, from the little kindergarten girl in St. Nicholas, I hear Gertie repeating when she is taking special care of something, and it pleases me well, for I believe we, as Americans, are very apt to throw away the threads, thinking that they do not amount to anything.

We need to be more careful about the little things. Christ's command was, "Gather up the fragments *that nothing be lost*," and sometimes I wonder if the whole secret of success does not lie just in "Gather up the fragments."

The other day a successful merchant sat near me at a friend's house. The lady picked up some pieces of well-worn, snowy muslin that had been left over after binding up a wound, and threw them in the open grate and passed out. "That was not right," said the merchant to me. "Oh, it wasn't much," I answered; "hardly worth going to the rag-bag to deposit." "But the principle it involves is immense," he answered. "Directly under the table where we receive the mails is a barrel. The order from the Post Office Department is to 'cast all wrappers around packages receivable at this office into it; also registered envelopes, etc.' It seems like a small matter, but when one thinks of the amount of waste paper in all the Post Offices in the United States they find the aggregate great. Another barrel stands under my private desk. I fill it in about a week. The value of paper in it amounts to, say, twenty cents. I am conscientious, too, about anything being put in mine that belongs in the other. 'Faithful in little, faithful in much.'"

Oh, what a stingy man! I hear you exclaim. I protest against the charge. He is careful, but not avaricious, as his family, his church and the poor around him can testify.

Another successful merchant in one of our large cities pointed out to an observer two clerks who were in his employ. One, he said, "cuts the strings when he opens a package, the other unties them." The former he prophesies will be a clerk all his life, while the latter will eventually sell his own goods.

This idea of being careful should be taught in the nursery, and if the money spent in sugar-plums should be given to the children, to be used for benevolence or to be laid up for them in time to come, it would be more profitable.

What! says some one; I never have anything to deposit in bank but pennies and nickels. Very well, begin with them, and give one-tenth of the increase to the Lord.

Mr. Fawcett, the blind Member of Parliament, whose personal misfortune makes him quick to apply sound common sense to the misfortunes of others, has issued a bill in the British Parliament, authorizing Post Masters to issue blank forms containing places each the size of a penny stamp. Any person or child returning it, filled, will be credited in the postal savings bank for the amount. A penny any one can save, and once invested in a stamp the owner becomes a bank depositor.

Some one says, "Away with the stingy rich and the improvident poor." Herein lies the secret. The wealthy, as a rule, gain what they have by prudent foresight and keep it by thoughtful care. Some poor despise the small economies and think the ones higher up the ladder are above them. Not so. Mrs. A., wife of one of our comfortable men, takes pleasure in using her own and her husband's cast-off garments for the children, making handsome suits. Mrs. B. scorns these little economies, declares remodeling clothes is something she abominates and knows is poor policy. Her children do not look as well dressed as her neighbor's, for the new material is inferior to the old in quality. Suddenly sickness comes in Mrs. B.'s family and the death angel takes a lamb. The father's purse is empty, so they borrow money of Mr. A., (who, thanks to his wife's economy and his own good management, has it to lend).

Thus it goes on and on. One might write a book about it, and even then the story would not end.

A GOOD BEGINNING OF THE DAY.

"HURRY, Mabel, or you will not be ready to eat breakfast with father; he has to go away to the upper town to work on a house this morning, so is obliged to leave earlier than usual."

In a minute the little bare feet were out on the warm carpet, and the process of dressing went on rapidly in mother's cosy room, where there was always a fire in cold weather.

"We'll keep the house warm and snug up stairs and down, Susan, if we can't wear much finery; don't you say so?" said father. Susan was of the same mind and a cosier little home for a working-man you could not find anywhere. The helpful fingers of the older sister soon made both tidy and sweet as two pinks and then they tripped down the stairs and made a rush for the first kiss from father. He had a good strong arm to wind around each and thus they carried him (or he them, it was hard to say which) out to the breakfast table.

"This is the kind of drink to keep the cold out," he said as he passed his cup again to be filled from the steaming, fragrant coffee pot. "I think if all of our men had such coffee at breakfast and such a home they wouldn't stop at the dram-shop on their way to work."

The excellent breakfast was eaten with its accustomed good cheer and there was time afterwards for a Psalm and an earnest, humble prayer for God's blessing upon them through the day. Then the substantial dinner was packed in the handy pail with compartments, and while he was buttoning his rough, warm coat and drawing on his buck-skin gloves, Mabel came dancing up and saying: "Can't I walk just up to the corner with you, papa?"

"Isn't it most too cold deary? but just as mother says."

"If you will wrap up warm you may," said mother. The thick, wadded sack and warm knitted hood were on in a minute and Mabel tripping along happily over the crisp snow. The corner was quickly reached when father stooped down for a good-by kiss, and then both went their way for the day. It was a happy way to begin it, and left each heart in the best possible frame for continued enjoyment.

I see a carpenter go to his work every Summer morning accompanied by his little girl "as far as the corner." Then he kisses her and she trips back to her home. I do not know anything further about them but I feel sure he is a good father, and that they have a happy home. OLIVE.

FASHIONS.

DOTTED and flowered Swiss muslin dresses will be worn again.

Black Chantilly lace is coming again into vogue.

The poke bonnet in its modified shape is a decided favorite.

Satin is still the most popular material for the dressiest toilet.

Colored lace mits in every style will be more worn this season than ever before.

Steel buckles are shown for wear with the new steel laces used for dress trimmings.

Flowers and feathers will again be mingled in bonnet trimmings.

Ginghams of all kinds, plain, plaided, checked and striped, will be worn.

Lisle-thread gloves will be as fashionable this summer as they were last.

Boots laced up the instep are coming largely into favor for the promenade.

Shirring is seen upon skirts, bodices, tabliers, scarfs, mantles and bonnets.

Muslin and lace fichus and collars bid fair to take the place of linen collars.

Dark-red holly berries are very effective on simple dresses of pure white organdie.

Massed wreaths of daisy buds on flexible stems are exceedingly pretty and graceful.

Leg-of-mutton sleeves appear on new toilets.

Shrimp, a yellowish pink, is among new colors.

Breakfast caps take on square shapes both in front and back. They are made of rows of plaited white lace mounted on a net crown, three rows being turned each way from the crown and the join hid by a small jabot. The only trimming is a pair of very small rosettes made of double Surah and placed on the left side.

For a young girl a pretty toilet is of lavender-colored surah. The round skirt is trimmed with three narrow-pleated flounces. Over this skirt there are three draperies of brocaded lavender surah; the middle drapery is edged with fringe. On each side there is a band of plain surah, embroidered with lavender and white beads; the draped back width is of brocaded surah. The basque-bodice has square pockets and revers of the same.

Children's dresses are still made in the sack-princess style, but the fronts and back, instead of being plain, are gathered full into the neck and continue full down to the bottom, while a band confines them round the waist. Underneath is the usual kilt skirt, which may be made separately or sewn to the edge of the polonaise, forming but one dress. Instead of a band a sash may be worn round the waist, which is tied at the back a little to the left side.

In wash dresses for the warmer season, the princess shape is to be most general. A very pretty costume is made of pale pink percale, figured with tiny sprays of flowers in their natural hues. The overdress is caught up in the back with bows of pink and white percale. The underskirt is of pink linen, flounced up the front to the waist with narrow plaited frills edged with tiny scallops in white button-hole embroidery. The overdress is bordered with a gathered ruffle to correspond with those on the skirt front. A graceful little fichu is added, trimmed all around the edges with a similar ruffle.

CORRESPONDENT'S CORNER.

RURAL SISTER:—In reply to a communication in last issue, we would say that we have endeavored to vary the spirit and letter of the columns as much as space would allow but suggestions and questions are acceptable, as our pleasure is the interest of our friendly patrons.

The subject of etiquette is one that allows of much individual applications as to propriety. Circumstances influence decision of right or wrong, but true politeness is one of the surest guides to good manners. Ward's Etiquette and American Code of Manners (the latter a late edition), are good books of etiquette from which no doubt you will obtain answers to your queries. Information may only meet your case in the main, your personal judgment will supply the rest.

CAN you tell me what will remove dandruff from

the head and make the hair grow? Are there not simple remedies that will answer the purpose as well as expensive hair restoratives? Carbolic acid is good for diseases of the skin; will it injure the hair if it is made very weak or put in oil?

MRS. I. T.

ANS.—A weak solution of borax or ammonia is excellent for cleansing the head and hair, and a tea made of rosemary will promote growth.

While not feeling confident enough to recommend the use of carbolic acid, we would say that our own judgment favors it.

No matter what your feeling or ailment is, Hop Bitters will do you good. Prove it.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

HOW TO BIND THE RURAL.

GEORGE SINCLAIR.

ANY agricultural paper that is worth its subscription price is worth preserving. An article that we pass by as being of no special value to us

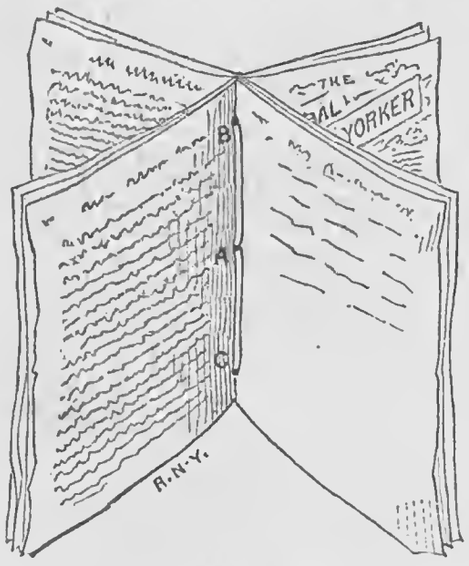

FIG. 239.

now, may contain items of information that will be of great service to us at some future time.

The farmer who receives the RURAL every week and takes care of it has an ever increasing fund of practical information. But it may trouble him somewhat to find any particular item when he wants it if his papers are thrown together loosely; then, too, the leaves get ragged and torn from frequent handling. It is a great convenience to the reader to have the papers bound, and any one can bind his own RURAL at the cost of a very few cents per volume.

If you would have a neat book you must begin to take care of your paper as soon as it comes—keep it neat and clean. A piece of newspaper large enough for outer leaves or covers should be sewed on at the time you sew and cut the papers; this will answer a good purpose and may be torn off at any time.

It is a good plan to sew the papers together in pairs, as in Fig. 239, when you are ready to bind. Open them at the middle, place the backs together, pass the thread through both papers at A, back again and through at A, down on the other side to C, then back to A and tie.

Take three pieces of tape, or three strips of strong cloth half an inch wide; give them a coating of paste and dry them.

Sew the papers to the tapes, passing the thread around the tapes and through the papers inside of the threads by which they are fastened together. Round the backs a little and give them a coating of thick glue. For covers, take two pieces of pasteboard a little larger than the leaves, glue the tapes to the inside of the covers, glue a piece of cloth over each tape to hold it firmly. For the back use a strip of strong cloth wide enough to lap onto the covers an inch or more and long enough to turn in and fasten on inside covers. Cover the boards with dark cambric, letting it lap well on inside around the edges.

Cover inside with white paper.

This makes a cheap but neat binding. Colored leather for the back and marbled paper on the covers will make a more stylish binding.

The work is all done with common glue.

Put your book under a firm weight for a few days.

I have just finished binding a lot of agricultural papers and feel well paid for my trouble. If I had attended to it at the end of each year, several val-

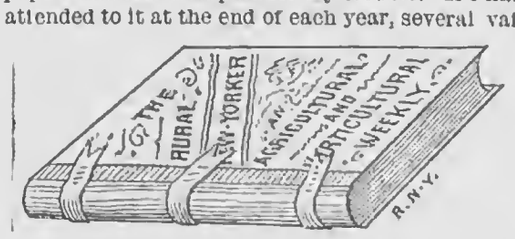

FIG. 240.

uable numbers that are now missing would have been saved.

Fasten a small tin can inside a larger one by passing a couple of wires through the top of each and you have a good glue pot.

Paste-board boxes to make covers of may be had of any dry goods or boot and shoe merchant for the asking.

ASPARAGUS.

ANNIE L. JACK.

THIS season of the year is noteworthy. The budding lilacs and flowering bulbs, the tender grass and fresh leaves brighten the days. The housewife finds amid the cares of the dinner-table a pleasant variety. Crisp lettuce, spinach and cress infuse added brightness to the meal, and that choice, healthful vegetable, asparagus, is with us for six or seven weeks. Cut every morning fresh from the garden, it is indeed a luxury, a dainty dish, and can be prepared in so many ways that children care but little for meat while it lasts. Mrs. Henderson, in her "Dinner Giving," gives the simplest way of cooking as follows:—"Tie the stalks in bundles, keeping the heads one way, and cut off the stalks so that they may be of equal length. Put them into well-salted boiling water and cook until they are tender. While boiling, prepare some thin slices of toast, arrange the asparagus, when well drained, neatly upon it, and pour over a white sauce, as for cauliflower. Time of cooking asparagus, about eighteen minutes."

The points of the shoots, cooked like peas, form a very choice dish and a novelty. As a breakfast dish, or for children, it is very nice cut into small pieces the size of peas, with an ounce of butter, a tablespoonful of cream, the same of gravy, and a little pepper and salt. Boil in just as much water as will cover it first, then pour this off and add the above ingredients, also three well-beaten eggs. Stir over the fire a minute to set the eggs, and pour over slices of bread that have been dipped in boiling water and butter. As a blood purifier and a diet to supply albumen, asparagus is a valuable article of food, containing more of this element than anything except eggs.

COOKING VEGETABLES.

To have vegetables in perfection they must be gathered for the day's use before sunrise while they are cool, and then kept cool in a cellar or in cold water till the time for cooking them. If, however, they are stale when brought to the kitchen, cut off all the stems fresh and put them in cold water till wanted. Boil in soft water to preserve their color, but if only hard water can be got, add a little soda. Salt the water, let it boil, put in the vegetables and boil briskly; then take them out as any delay after they are done spoils them. To get rid of snails, slugs and worms, which sometimes lurk among the leaves, wash in warm salt water, but at once put them in cold water to maintain their crispness. Beets must not be cut or the color and flavor will boil out. Turnips must be boiled in their skins; potatoes must be put in the pot filled with cold water three hours before boiling, then set on to boil in the same water. If these directions are carefully followed, many people will come to a knowledge of the capabilities of an important branch of food but little understood by nine out of ten.

CHIEF COOK.

ROBBINS' WASHER.

THE Bissell Manufacturing Co., writes to us as follows:

"If you will notice the directions and notes given below, you will perceive that it is only through negligence and carelessness that clothes ever rust or turn yellow.

When the washer is in operation, always raise the lid by placing a stick across the boiler, or leave it off entirely.

In every instance give full time to the operation of the washer.

Dry the washer thoroughly immediately after using by placing it on the top of the stove.

If the cover is kept closed, the effect of the alkali will yellow the clothes, while, if it is raised or removed so as to admit the air freely the effect will be to bleach the clothes thoroughly.

The washer must not be allowed to cool while wet. Take it in pieces and dry thoroughly the moment it is removed from the boiler. With this care it will last a life-time."

From our own experience with this washer, we must believe that where it does not give satisfaction it is because the person using it *does not follow directions*. And to this we may add that many women expect too much of the machine.

Reply to Mrs. Wager Fisher.

First, I would say some persons think themselves possessed of sufficient independence to act in such small matters as they please. Second, if the knife is clean enough to cut the food without contaminating it, the rule that forbids its being carried to the mouth is one of extreme folly. Finally, fathers and mothers who have handed down to their grown-up daughters any claims to superiority must have many qualities that such daughters would do well to notice, admire and cultivate. And by so doing they would cultivate the heart, so that such a small mannerism as drinking from a saucer could not materially affect them. Grown daughters who would allow themselves to feel *mortified*, must be lacking in good sense, in natural affection, and in true nobility of soul. From such deliver us. E. M. W.

COLORING RECIPES.

To Color Yellow.

GET a half bushel of hickory bark; boil it in brass or copper with water enough to cover the bark. When the strength is out, take out the bark and put in one-fourth of a pound of alum. Put in your rags, keep them hot one hour, then, take out and dry.

To Color Cotton Blue.

Dissolve one ounce of copperas in hot water; put it in a tub or kettle large enough to hold the goods, let them be in one hour then take out and rinse. Take one ounce of prussiate of potash dissolve it in water enough to wet the goods or rags, add one tablespoonful of oil of vitriol; stir well and dip one hour. Have the liquid a little warm.

To Color Green.

Put some of the yellow rags in this blue dye after you take out the blue rags.

MRS. F. A.

To Color Cotton Chrome-Yellow.

The directions given are for coloring 15 pounds of goods. Dissolve eight ounces of white sugar of lead in a tub with water enough to work the goods. In another tub, with same quantity of water, dissolve eight ounces of chrome. Put goods first into the sugar of lead water, take out, wring, shake and return. Do this five times. Then put through the chrome water in the same way. Return to the sugar of lead tub, treat as before, rinse well and dry. E. I. J.

It is impossible to remain long sick or out of health where Hop Bitters are used.

Miscellaneous.

Back Supporting Shoulder Brace

Is so constructed that it gives a strengthening support to the back, and draws the shoulders back so as to expand the chest, throwing the body into an erect and graceful position. Price $1.50 by mail. Give waist measure. Send for circular and illustrated price-list of

Hygienic Undergarments

to

Mrs. A. FLETCHER & Co.

News of the Week.

HOME NEWS.

MONDAY, May 2, 1881.

The floods in the West have been doing much damage since our last report. At East St. Paul, Minn., streets were submerged and at Carver, the inhabitants in the lower part of the town were obliged to flee to higher ground. The lowlands along the Mississippi were flooded. Much damage was done to crops and stock. Near Des Moines, Iowa, twenty families were kept out of their dwellings for several days. Near Quincy, Ill., a strip of highly cultivated land, from three to eight miles wide and 50 miles long, was completely submerged. The Missouri River at Atchinson, Kan., was over 22 feet above low water mark, and the flood there equals the notable one of 1844. At Nebraska City, Neb., about 400 persons were rescued from the floods, whose houses were swept away and 8,000 head of stock were lost. At Kansas City, Mo., the waters rushed over the lower town so rapidly that the inhabitants could only flee for their lives without being able to remove their household goods. It is said that fully 6,000 people in Missouri were driven from their homes.

A bill has been introduced into the New York Legislature requiring telegraph and telephone wires in the city of New York to be put under ground. With the new system of electric lighting, which will be undoubtedly introduced in all cities of considerable size, there will be an additional reason for getting the wires out of the way. In Germany the wires have been put under ground with manifest advantage.

We have to record this week the death of two eminent men of letters—John G. Palfrey and James T. Fields. The former, the historian of New England, died on the 26th inst., aged nearly 85 years. He was born in Boston May 2, 1796, and graduated at Harvard in 1815. He was at one time editor of the North American Review and also at various times held office under the government. He has written a large number of books on a wide range of subjects.

James T. Fields, poet, lecturer and publisher, died in Boston on Sunday evening, the 24th inst. He was born at Portsmouth, N. H., Dec. 31, 1817. He studied at the Portsmouth High School, but did not receive a collegiate education. He was for some time a member of the publishing firm known as Tichnor & Fields, Boston. He was a poet of considerable reputation, a lecturer of acknowledged power and grace, a man of most genial manner.

A sensible bill has recently been introduced into the Massachusetts Legislature, which provides that before a liquor saloon is opened for the sale of intoxicating liquor the consent of a majority of the property owners in the vicinity shall be obtained. It is on the ground that a liquor saloon partakes of the character of a nuisance.

President Garfield received a miniature bale of cotton the other day from an ardent admirer at Fort Worth, Texas. It was neatly bound with polished brass strips, and marked as if ready for shipping. It was accompanied by the following letter: "By this mail I send you a bale of cotton to enter your cabinet of curiosities. The fortunate people out here are free from general elections for two years, and have devoted their time to increasing the importance of their king—cotton—and enhancing the value of his empire—Texas.

Vermont is the only State that has not a single Chinaman. North Carolina and Delaware have each one, and Alabama four. The largest number in any Southern State is 435, and Louisiana is the State. Sugar growing has brought them there. The other States and Territories in which they are most numerous are: Pennsylvania, 170; Illinois, 214; Utah 518; Arizona, 632; New York, 942; Montana, 1,764; Idaho, 3,378; Nevada, 5,423; Oregon, 9,515, and California, 75,122.

Contracts have been made to carry 60,000 emigrants from Norway and Sweden to Hull, whence they will proceed to Liverpool and thence to America.

On the 25th inst. the statue of the late Admiral Farragut, U. S. N., was unveiled at Washington with imposing ceremonies. The statue represents Farragut with a marine glass in his left hand, his foot on a block and tackle and supposed to be standing on the Hartford. President Garfield, Gen. Maynard and Senator Voorhees made the addresses of the occasion. The statue cost $20,000, and Vinnie Ream was the sculptor.

The question of free canals was settled, for the present, in the State Senate on the 27th inst. Mr. Forster's resolution amending the Constitution so as to abolish all tolls on the Erie canal and providing for its maintenance by a tax on the people, failed to pass. The prevailing belief is that a free canal is not so much needed as an enlargement or increase of its capacity, but the present Constitution does not permit the State to make any improvement beyond keeping it in repairs.

Illinois affords a slight indication of what may be expected when the women vote. They are asserting their new rights mostly in temperance issues. In one town in Illinois over a thousand votes were polled by the women, and in another all their candidates were elected by a majority of 500.

The executive committee of the World's Fair Commission held a brief session on the 27th inst. No business was transacted, the regular public meeting of the commission being adjourned until next Wednesday. It is stated that T. F. Talcott, one of the active promoters of the project, has resigned from the commission. Talcott is reported as saying, that the transportation companies wanted to reap without sowing. Their policy was disheartening, and he washed his hands of the whole affair. The citizens had raised a million, which was enough to show their earnestness.

The sum of $1,630,000 is required to pay the salaries of the members of the House of Representatives and their mileage. In addition to this the last House voted itself $125 for each member for newspapers and postage stamps, making an additional $37,725. The clerk disbursed on account of salaries to stationery clerks $221,449 last year, exclusive of $25,000 which the Treasury Department paid direct to the stenographers. During a recess the persons who receive compensation are only about one hundred less than at other times. The cost for the Senate is about $600,000 a year, nearly $400,000 going for salaries and mileage.

Secretary Blaine recently authorized the preparation of working drawings and estimates of the erection of the monument to George Washington at his birthplace in Virginia. The sum appropriated was $30,000.

The developments of the Star Route mail service jobbery promise to open one of the most discreditable chapters of our interior political history. For the people to be robbed of millions of dollars by rascally contractors and their confederates is bad enough, if that were all; but when the stolen money goes, as is charged, to swell a corruption fund and to buy votes by wholesale, the climax of outrage is reached and the infamy becomes, as it were, monumental.

The prohibition law in Kansas has not gone into effect till to-day, yet in most towns saloons are already closed, and there was not to be an open bar in the State at the beginning of this month. The Governor of the State says that many of the saloon keepers have removed to Missouri, "but for every saloon keeper that goes out of Kansas on account of the prohibitory law a sufficient number of sober, industrious, energetic families come into the State to build a school-house."

There is a movement on the part of certain persons who profess to be governed by a desire to improve the condition of the colored race in America to found a colony in New Jersey, where all the industrial pursuits will be taught to colored men, with a view of their becoming qualified to fill responsible positions in factories of all kinds.

The flood of immigrants across the State to the West is as great by the Erie as by the Central. Last week the Erie carried 2,661 immigrants into Buffalo, 2,071 of whom went West by the Great Western Railroad.

After June 1st postal cards will be unmailable if anything but the address is written on the address side. An order to this effect was issued recently by the Post Office Department.

Good news! The Senate, it is reported, will soon take up the executive business, for which it was called together. The unopposed nominations will be at once confirmed, the Chinese treaty will be at once considered, and the intolerable proceedings of the past few weeks will be brought to an end. Can it be!

North Carolina is agitating the temperance question. A Prohibition Convention was held on the 27th inst., about 450 delegates being present, representing every county in the State. State, district and county committees will be appointed to push the work, and the campaign against intemperance promises to be a lively and aggressive one. The popular vote on prohibition will be taken on the first Monday in August.

A Miserable Little Woman.

A lady writes: "Looking back to the time when I commenced using your Compound Oxygen, I can scarcely believe myself to be the miserable little woman I was. I had not had one day's good health in almost seven years, and was going down every day. Can now work with delight; am still gaining in flesh. *My case seems somewhat tedious, but none the less sure.*" Treatise on "Compound Oxygen" sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

AGRICULTURAL NEWS.

Upon motion of Sir. H. Maxwell, the British House of Commons, April 1, after prolonged debate, resolved, by a vote of 75 to 59, to put the trade in adulterations of butter and substitutes for it under strict governmental supervision ...A bill enacting severe penalties for adulteration of butter and cheese is before the Illinois legislature. It also provides for a State inspector of these commodities..... The London Times reports that in the small county of Bedfordshire 15,000 acres have been put out of cultivation by reason of agricultural distress. .....The Welland Canal has been opened to-day..... ..Last Thursday the Girard Point Grain Elevator, situated near the junction of the Schuylkill and Delaware Rivers, Philadelphia, with a good deal of the surrounding property, was destroyed by fire along with its contents—67,000 bushels of wheat and 30,000 bushels of corn. Total loss about $700,000

The Texas wool clip is a fortnight later than usual.....A canning factory is projected at Poughkeepsie, N. Y., mostly for tomatoes..... The St. Louis Grand Jury last Wednesday made a report to the Criminal Court of 17 indictments against Robert L. Lindsay for connection with the Missouri land swindle, recently unearthed, nine against John Brady, and four against Herman Schuster, also connected in the land frauds..... Two of the largest and handsomest maple groves in this State are at North Harpersfield, Delaware County. They contain 4,200 trees, and will furnish seven tons of sugar. In 1875 there was 200,000 pounds of sugar made in the town of Harpersfield, and it is estimated that the production this year will exceed that enormous quantity.....At Blidah, Algeria, may be seen eucalypti, only five years old, 60 feet high.....A skeptical Frenchman writes to the Prefect of Police at Paris that all the asserted discoveries in regard to trichinæ are mere inventions of vegetarians, and he offers to prove it by living three days off nothing but pork that is alleged to be diseased, if the Prefect will supply the meat—a Gallic mode of suicide..... A resolution has been introduced into the Arkansas Legislature to hold a U. S. Convention of farmers in St. Louis next October.....That project of the Freedmen's Oklahoma Association, promising 160 acres of the public land to every freedman that settles in Oklahoma, has been declared illegal by the Commissioner of the General Land Office in Washington. The government which prevented Col. Carpenter and Capt. Payne and their white followers from occupying the Choctaw Indian reservation is not likely to be more complaisant to the colored "man and brother."..... Special efforts are being made for the success of the meeting of the Mississippi Valley Cotton Planters' Association at Memphis, May 25. Delegates are invited from all the Cotton States, and from various manufactories of this country and England interested in agriculture or cotton manufacture. It is proposed to make the Memphis gathering a tender for awakening popular interest in the exposition at Atlanta in October..... ... The bill introduced into the Massachusetts Senate, allowing the alumni of the Agricultural College representation on its Board of Trustees, has been defeated by means which the editor of the Haverhill Gazette, who was present, characterizes as "a disgrace to the trustees and the Senate."..... Gen. Le Duc has published a pamphlet showing why he should "stick," by showing the good he has done.....The Illinois Agricultural College, at Champaign, has now 280 students and a newly-elected Regent, Dr. Peabody..... ..Iowa has $5,000,000 worth of real estate exempt from taxation under the Timber Culture Act.....That beet sugar company at Franklin, Mass., will try the experiment another season. The property of the old company has been sold to a new one for $60,000. Contracts are to be made at once for a supply of new beets, and the probabilities of complete success are thought to be stronger than ever before.....Flax culture is growing rapidly and largely in the West. .....The Russian Government announces that the grain crop of the old Caucasus is almost certain to prove a failure; that locusts have begun to appear in incredible numbers in all districts upon the Caspian Sea; that no such visitation has been known before, and that in one district 39 tons of locusts' eggs were destroyed. The Government also points out that in the event of the grain crop failing (and Tiflis merchants indorse the same view), the United States will have to supply the grain, which they can do cheaper than the planters represented by the merchants of Odessa and Tanganrog.....With regard to the prices of wool, it is safe to say that no important improvement is likely to take place in the near future, owing to the nearness of the new clip, and the large supplies of foreign and domestic still available on the seaboard. The 1881 clip of California is held at San Francisco at prices too high to tempt Eastern purchasers in the present condition of their market, and all indications point to correspondingly extreme views on the part of growers in the South and West..... The New York State Legislature has appropriated $15,000 for the support of the State Fish Commission.....A Swiss colony has been established in Laurel county, Tenn. Cattle breeding, cheese making, tanning and wine growing are the industries which the settlers will become interested in. The colony is aided by a company of capitalists who planted a very successful Swiss colony at Highland, Ill, about 1830. Tennessee is to be congratulated upon so industrious and hardy an accession.....Seth Green states that he is convinced, on investigation, that an acre of water can be made to produce as much food as an acre of land. He adds that the improved acres of land in New York State are valued in the aggregate at $1,221,472,277, or $76.94 per acre, on the average. At this rate of valuation, the 647 inland lakes in New York State, covering an area of 466,457 acres, if properly stocked with fish, would be worth $35,889,200 as sources of food supply.

During the past week extraordinary depression has prevailed here in the line of ocean steam freights, which fell to quotations the lowest made in this market in a long period, leading, however, to freer movements, and, toward the close, a slight revival of firmness. Grain hence, by steam, for Liverpool, which went down 2½@2¾ pence per bushel, closed at 2¾d. bid; for Glasgow at 5d; for London at 4d; Bristol, Avonmouth and Cardiff at 5@5¼d.; Hull at 3⅞@4d., Havre at 11@13c., Antwerp at 4@4¼d., Rotterdam at 4⅛@5d., Bremen and Hamburg, on prompt shipments, at equal to 5@5½d. per bushel.....Owing to the low rates of freight, dealings in apples on export account have been lively here the past week. On the basis of 2s. 6d. to 2s. per barrel freight, contracts were made for 10,000 barrels to all ports against 3,100 barrels last week.....The arrivals here of hops since September 1, 1880, have been given at about 84,250 bales, against about 76,100 bales the preceding season; exports hence, in the same time, about 40,700 bales, against about 42,500 bales in the corresponding period in 1879-80.....

From European advices of April 11, we learn that in Germany Spring work was late, and the Wheat plant generally backward, but strong and healthy. In Holland vegetation was backward, and the Winter barley suffered from the severe frosts. In Roumania the weather had been favorable, and the growing crops were reported as being in healthy condition. In France the young wheats continued in a backward condition, but the greater part of the Spring sowings had been satisfactorily accomplished. In the United Kingdom there had been a week of dry and scorching east winds, which brought vegetation to a standstill. The wheats were looking very brown, but held their own fairly well. They were late for the time of year; not more forward than generally is the case the first week in March. On light soils the weather was injuring the wheat plant at the roots

A General Company of Preserved Food and Salted Provisions has just been formed in France. Its object is to form "preserving" establishments at home and abroad, and especially in the Danubian regions where there are great numbers of beeves, hogs and sheep whose preserved flesh it is proposed to introduce into France. Under Ministerial letters this Company is entirely exempt from taxation for three years—wonder whether its formation has had anything to do with the embargo on our "preserved" hog products!.....

An Important Statement.

[Boston Globe, March 22.]

Most of the readers of this paper will remember an article published in our columns some time since regarding the remarkable case of Mr. B. F. Larrabee, of the New York & Boston Dispatch Express Company. Mr. Larrabee had been given up to die by a number of our best physicians, his trouble being Bright's disease of the kidneys in its most aggravated form. To-day he is as well and healthy appearing a man as can be found upon our streets, and a goodly portion of his time is spent in answering letters and inquiries regarding his case, and in telling of the wonderful power which saved his life, restored his health and has kept him well ever since. These are facts which any one can readily verify by communicating with Mr. Larrabee.

In this connection there is an important fact which we specially desire to state. When we published the account of Mr. Larrabee's remarkable recovery many people said: "Oh, that is paid for." People seem willing to read column after column about the sufferings of humanity and the horrors of disease, but as soon as a newspaper, in the interests of its readers and humanity, points out a pure and valuable remedy for alleviating these sufferings or of curing these diseases, they say: "Oh, that is paid for." This is all wrong. We know whereof we affirm regarding Mr. Larrabee's case, and knew it at the time we published it, and the present case of Dr. Whitney, which follows, is of precisely the same nature We have friends who have been cured, and from personal knowledge we affirm as we do. The newspaper is the servant of the public, and as such should study the public needs. Bright's disease has ever been Considered an absolutely fatal complaint, but from the remarkable cases which have come under our observation we do not hesitate to pronounce it curable, even in its final stages. These are facts which the public are entitled to know, and as such we publish them. The following editorial, copied from the Marlboro (Mass.) Times, we give entire for the benefit of our readers:

"Dr. Alston W. Whitney, of West Newton, who was recently in the Massachusetts General Hospital to be treated for Bright's disease, is now at home, and what is rather remarkable for a regular old school physician is doctoring himself with a patent medicine, to wit: Warner's Safe Kidney and Liver Cure. And it is doing him good, too, and strong hopes are felt by all his intimate friends that he will soon be almost as good as new. We don't advertise the Safe Remedy, and so what we say of it is not a paid-for puff, but we cannot forbear saying that we consider it a most remarkable medicine for the relief of all urinary, kidney and liver troubles, and we have known of its having wonderful and most astonishing remedial effects in some chronic cases of derangement where all other specifics had failed. We have had occasion to recommend its use in several cases, and have never known anybody to use it that was not *immediately* and permanently benefited."

FOREIGN NEWS.

Across the Atlantic the United Kingdom, the first place we come to, is still chiefly interested in the "Irish Question" in home affairs, while in foreign matters the Eastern Question has been temporarily over-ridden by interest in the Tunisian Question. Gladstone's Irish Land Bill does not content the Irish agitators, though its provisions are so liberal to the tenantry as to greatly displease both many of the Liberals, headed by the Duke of Argyle, who has resigned from the Cabinet in displeasure, and all the Conservatives, headed by Sir Stafford Northcote, who has succeeded Earl Beaconsfield as head of that party. It is doubtful if the extreme Irish party would be satisfied with any land measure that fell short of making a free gift of the land to the tenants—and then some of them would want donations to stock, till and fertilize it, the last preferably with the carcasses of the late landlords. Arrests still continue in Ireland under the Coercion Acts, chiefly of loud-mouthed nobodies, although it is now announced that Mr. John Dillon, M. P., and the other prominent members of the Land League will be promptly added to the number of prisoners. Dublin has just been "proclaimed"—that is, announced by the Government to be now subject to the Coercion Act, so that there, as in the other "proclaimed" districts, anybody may be arrested without charge and imprisoned without trial until the term for which the act was passed expires. The "proclamation" of Dublin causes "intense excitement," we are told by this morning's cable. .....The "Eastern Question" having been *temporarily* settled by the acceptance by Greece of Turkey's *ultimatum* with regard to its concessions of territory, the "Tunisian Question," as foreshadowed in our editorial of a few weeks ago, has taken the foremost place among the possible causes of a European embroglio. Tunis, under a ruler entitled Bey, is nominally a part of the Ottoman Empire, owing allegiance to the Sultan, but usually paying to him neither that nor anything else in the shape of revenue or reverence. On its Western borders, adjoining the French dependency of Algeria, live a bigoted Moslem tribe known to the "Frankish Infidels" by the name of Koumirs. They have always been hostile to the French in Algeria and showed it a few months ago by killing three of 'em. Of late Italian and French influences have been diplomatically contending in Tunis and the latter, formerly all-powerful, has been much weakened by its rival. The murder of those three Frenchmen by the semi-savage Koumirs has been seized upon to replace the "losable" French influence by "tenable" French domination. So war nominally against the Koumirs really against the Bey, was declared a couple of weeks ago, and a body of 40,000 picked French troops have surrounded "Koumirland," and seized upon the chief frontier points on the way to Tunis. The Bey, *in extremis*, appealed to the harrassed Sultan who blustered a

trifle as usual; Italy was "agitated" so that the ministry was overthrown for allowing the French to begin the war. The succeeding Ministry has done nothing to check it, however, yet it has just received an overwhelming "vote of confidence." France will "push things"; Italy will grumble anyhow and if she can get powerful "backing," like Bismarck's, for instance, will go to war; Turkey will continue to protest and the future will show the end of it all.

Kidney-Wort is a remedy which removes foul humors from the blood, and creates healthy action in every organ. Torpid kidneys and liver lead to gravel, diabetes, constipation, piles and rheumatism. Kidney-Wort is the surest and safest remedy now to use.—Rocky Mountain News.

LYDIA E. PINKHAM'S VEGETABLE COMPOUND is a remarkable remedy for all those painful complaints and weaknesses so common to our best female population. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Why do Hop Bitters cure so much? Because they give good digestion, rich blood and healthy action of all the organs.

BURNETT'S COCOAINE

Promotes a Vigorous and Healthy Growth of the Hair.

It has been used in thousands of cases where the hair was coming out, and has never failed to arrest its decay.

USE **Burnett's Flavoring Extracts**—the best.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, April 30.

Boston.—The following are the prices paid by receivers: BUTTER—New Northern — Vermont dairy lots, choice, 24@25c; New York dairy lots, choice, 23@24c; fair to good, 15@20c; New Western—Choice creameries at 28@30c, do. fair to good at 22@27c, ladle-packed choice at 21@22c, do. fair to good at 16@18c; old butter—Creameries at 18c, Fall made dairy at 18c, choice dairy at 16@18c, common to good dairy at 10@15c, and Western ladle-packed 10@15c. CHEESE—Northern factory—choice 13¼@14c ₩ lb; fair to good at 11¼@13c, anti skim at 8@11c; Western factory—choice, 13¼@14c; fair to good, 11@12½c; skim, 7@10c. EGGS—Eastern at 16@16½c, Northern 16@16½c, Western 15½@16c ₩ doz. BEANS—Northern hand-picked Pea at $2.50@2.55 ₩ bushel; do New York at $2.45@2.50; do. common to good $2.25@2 40; medium choice $2.40@2 50; common to good $2 20@2.30; Yellow Eyes $2 10@2 50; Red Kidneys at $1.90@1.70. Canada Peas 75c@$1. 10 ₩ bushel for common to choice. Green Peas at $1.25@1.70. APPLES at $1 @2 50 ₩ bbl. Cranberries at $3@6. Onions, Red, $3@3 50, White $3 75@4 ₩ bbl, and Bermuda $2.25@2 50 ₩ crate. PROVISIONS—Have been unsettled with a fair demand. Quotations: PORK, extra prime, at $13.50@14 ₩ bbl; mess at $17@19; Boston clear at $21.60@22, and backs at $22.50@23 ₩ bbl. BEEF is steady; we quote Western mess at $10@10 50 ₩ bbl; extra mess at $10,50@11 50; and extra plate at $13@14; Beef Hams at $17.00@18 50, and Beef Tongues $26@27 ₩ bbl. Smoked Hams steady; we quote Western smoked at 10½@11½c ₩ lb; Boston at 10½@11¼c, and 11½@12c for fancy in bags. LARD at 12¼@12½c for Western kettle rendered, and 12¼@12½c ₩ lb, for Boston rendered. Hogs at 6¾@7¼c ₩ lb live weight, and 8¼@8½c ₩ lb for city dressed. SEEDS—Calcutta Linseed is now nominally $2 05@2 10 ₩ bushel. There is a good demand for Grass Seed. We quote Clover Seed at 8@9c ₩ lb for Western and New York; Timothy at $2.75@2.80; Red Top at $2.05@2.15 ₩ bag; and Canary Seed at $1.50@1.75 ₩ bag.

Chicago.—WHEAT active but unsettled; No. 2 red Winter, $1.04@1.05; No. 2 Chicago Spring, $1 00¾@1.00¾, cash; No. 3 do., 90@95½c.; rejected, 73½@80c. CORN steady with a fair demand at 42½c., cash; rejected, 38½c. OATS quiet and weak at 35½c. RYE strong at $1.14. BARLEY dull at $1.05. FLAX SEED, $1.15. PORK quiet but steady at $17 40, cash and May; $17.42½ June; $17.52½ July. LARD in fair demand but lower, at $11.20@11.22½, cash and May; $11.27½, June; $11.35, July; $11 40, August. BULK MEATS steady and unchanged. EGGS, 11½@12c. BUTTER—Creamery, choice, 32@33c.; creamery, fair to good, 29@30c.; dairy, choice, 25@27c.; dairy, fair to good, 20@24c; packing stock, 13@15c; grease, 8@10c. CHEESE—Full cream, 13@14c.; part skim, extra, 10½@11c.; part skim, fair to good, 8@9½c.; part skim, hard, 6@7c.; low grades, 3@5c. SEEDS—The offerings are generally light; clover steady, with prime seed quotable at $4.40@4 50, and mammoth at $5@5 40; Timothy rules steady, with prime salable at $2 80 and choice seed at $2 90; flax is a trifle weaker, selling at $1.17@1 17½, delivered; Hungarian continues firm at $1.55@1.75 for German. HOGS—Demand moderate; mixed packing, $5 75@6 05; light, $5 85@6 10; choice heavy, $6 10@6 40; prices 5@10c lower. CATTLE—common to fair shipping, $4 60@5 10; good to choice, $5 40@5 65; butchers' steady at $2 50@4 50; stockers and feeders, $3 20@4 80; extra feeders, $4 90@5 20. SHEEP—Market strong and brisk; common to medium, $4 90@5 30; good to choice, $5 60@6 25.

Cincinnati.—WHEAT in fair demand; No. 2 Red Winter, $1 12. CORN steady; No. 2 Mixed, 47½c. OATS firm; No. 2 Mixed, 40c. RYE dull; No. 2 at $1 22. BARLEY scarce and firm, No. 2 Fall held at $1 15. PORK firm at $17 50. Lard in fair demand at $11 20@11 25. Bulk-meats firm; Shoulders, $5 75; Clear Rib, $8 55. Bacon firm. Shoulders, $6 75; Clear Rib, $9 37½; Clear Sides, $9 75. BUTTER—Prices have suffered a farther decline of fully 2@3c ₩ lb on all grades during the week. All butter should now be sold packed. Fancy Creamery sells at 29@30c, prime do at 25@28c, choice Dairy at 23@25c, choice Western Reserve at 20@23c, prime to choice Central Ohio at 17@18c, medium do. at 13@15c and inferior is dull at $10@12c ₩ lb. CHEESE—There is a moderate supply of choice cured factory offered and it sells at 12½@13c, but prime to choice Northwestern is selling at 10@11¼c ₩ lb. Some new Ohio factory is arriving, but it is poor and unsalable. SEED—Clover and Timothy are dull and nominal but Millet is in active demand, scarce and higher. Prime to choice Clover sells at 7½@8c ₩ lb, and Timothy at $2 65@$2 75 ₩ bushel from store. Round lots on arrival would not bring these prices. Flaxseed is steady at $1 10@1 12½ ₩ bushel. German Millet sells at $1 90@2 00, common Millet at $1 40@1 50, and Hungarian Grass at $1 25 ₩ bushel. Hogs quiet; common and light, $4.50@$6; packing and butchers' $5.50@6.35.

St. Louis.—WHEAT No. 2 Red Fall $2.06⅞ cash; $1.07@1 07⅛ May; $1.06@1.07 June; $1.01@1.01⅝ July, 98¼c. August; 97½@97⅝c. all the year; No 3 do $1.02⅛ bid; No. 4 do 92c. bid. CORN dull at 42¾@43c. cash; 42⅛c. May and June; 42⅝@42⅞c. July; 43⅛c. August. OATS firm at 35⅜@35⅝c. cash 34⅞c. May; 32⅜c. July. RYE $1.10 bid. PORK quiet; jobbing at $17.60. Lard dull at 11⅛c. bid. Bulkmeats firm with a fair demand for car lots; shoulders $5.70; clear rib $8 60; clear sides $8 80@8.85. Bacon firm; shoulders 6¼c.; clear rib $9.20@9 25; clear sides $9 50. Hogs fairly active; Yorkers and Baltimores $5 85@6; mixed packing $5 75@6; choice to fancy $6 15@6 35; pigs $5@5.40. CATTLE Supply very light; little doing; prices weak on heavy grades—quotations the same as those last given. SHEEP steady; wooled $4 60@5 70; clipped $3.75@4.50.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 30, 1881.

BEANS AND PEAS.—Another advance is noted in beans and the high prices do not check the demand for home or export use. Very choice medium and marrows are held at $1.75 for small trade. Red kidneys do a shade better for selected. Prime green peas have a fair sale, poor lots neglected; prime Wis. $1.57@1.60; Southern B. E. peas $3.10@3.20 per 2-bu. bag, an advance.

Medium and marrow beans, prime, $2 65@2.70; other $2.50@2 60; white kidney and pea $2.30@2 60 red kidney, prime $1 60@1.65, other, $1.40@1.50; black or turtle soup $1.45@1.50; Lima, $5@5.50 nominal.

MAPLE SUGAR.—The demand is over for steady purposes and the light supply is quoted easy. Sugar 7@10c.; syrup 10@11 lbs. to gallon, 60@$1 in can.

BUTTER.—The market is in a broken, unsettled condition and prices show a marked decline. Supplies have come forward faster than could be used, with quotations where they were a few days ago and what accommodation that has thus formed has produced the decline. Consumption will increase if prices favor retailers, and dealers look for an active trade especially as quality favors buyers in almost all cases. Common butter is hardly looked at while good to prime table stock is quoted where it is. Exporters are doing a little more but the demand is not a feature.

New Butter.—Creamery, choice Western and Pa. 24c. other, 23@23c; sweet cream, 22@23c.; State half tubs, choice, 21c; fair to prime, 17@20c. Welsh, choice, 20@21c.; other 17@19c.; very common or stale new 14@17c.; Western imitation creamery 17@21c.; do dairy 15@19c., factory 15@17c.

Old Butter ranges 25c.

Receipts for week 20,365 pkgs.

Exports do. 1,150 do.

CHEESE.—Receipts have increased moderately only and prices have tended lower on new with 13c. the outside rate. Old has been held steady. Exports the past week have been 17,890 boxes. Quotations are for

New at 13c. for best full cream; 11½@12½c. for fair and good lots; do. full-skimmed at 4@6c. old as follows fancy at 13¾@14c.; fine and prime, 12¾@13¼c.; do. fair, at 12@12¼c.; do. half-skimmed, 8@9c. Ohio factory, fine, 13c.; do. good to prime, 11¾@12¾c.; do. fair to good, 10½@11¼c.; do. poor to fair 8@10c. Skimmed creamery, 4@6c

Receipts for week, 16,796 boxes.

Exports for week, 18,391 boxes.

Liverpool cable, 70s.

Steam to Liverpool, 17s.6d.@22s.6d.

COTTON.—Trade has been slack this week and prices varying slightly; latest prices are for

May, 10.40@10.5 c.; June, 10.58@10.59c.; July, 10.67@10.68c.; August, 10.74c.; September, 10.46@10.47c.; October, 10 11@10.12c. November, 10@10.02c., December, 10@10.02c.; January, 10.10@10.12c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Receipts for the week, 16,300 bales, Exports do. 13,718 do.

DRIED FRUITS.—Apples have a good inquiry and rule firm in price. Peaches are wanted at steady prices and small fruits generally are quiet but firm. Quotations are for

Evaporated apples at 8½@9c. for prime and choice stock, sliced apples at 4¾@5¾c. for good to choice North Carolina, 4@4½c. for V., apples, 4@4½c. for Tenn do. 4½@5c. for State do; 4½@4¾c. for western, Ohio and Mich. Peaches at 23@25c. for evaporated peeled; 13½c. for unpeeled do; N. C. peeled at 19@22c.; for the better qualities of new and 12@13c. for old; unpeeled peaches at 5¾@5¾c. for halves and 5½c. for quarters. Plums at 15@16c. Blackberries at 9c. for prime. Cherries at 15c. Raspberries at 24@26c. Whortleberries 11@11½c.

Receipts for the week, all kinds, 330 pkgs.

Exports dried apples, 3,925 pkgs.

EGGS—Receipts for week, 14,115 bbls.; do. last week 11,820 bbls. The market has fallen into a cheaper position and can hardly recover again at this part of the season. Since our last best fresh are 5c. off per doz. Duck and geese are also lower. Southern here are not turning out good with warm weather at both ends of the line of shipment.

Near points, 16@16½c.; State and Pa., 15½@15¾c.; Western, 15@15½c.; Southern, 15c.; poorly packed and small run 14@14½c.; goose 27@28c. duck, 20@21c.

FLOUR.—Offerings are larger and prices weak at a decline in sympathy with wheat.

Latest prices are: $3.80@4.50 for very inferior to strictly fancy superfine State and Western; $4.10@4.65 for poor to choice extra State and Western, odd lots and lines; $4 65@4 85 for choice to fancy do.; Inferior to good white wheat, trade and family extras, $4.50@5.50; good to choice do. at $5.50@6.35, (very choice up to $6.50 and fancy at $6.75) red and amber winter wheat inferior to choice trade and family at $4.50@6.25; round hoop Ohio, $4.20@4 85; and trade and family brands of do. at $5.00@6.25, the latter for very choice; St. Louis $4.75@5.65 for inferior to good extra, $5.65@6.50 for good to very choice, and up to $6.75@7.00 for very fancy brands; Minn. clear, inferior to very choice at $4.50@5.85; Minnesota "straight," poor to very choice, at $5 40@6.75, and patent inferior to fancy at $5.75@8.00; city mill extra at $5.55@5.70 for the West Indies; do. for England at $4.50@4.75 for poor to choice spring wheat; do. trade and family extras $5 70@6.75 do. for South America, $5.75@6.00, the latter for very choice; No. 2 at $3 00@3.75 for very poor to very fancy.

Receipts for week, flour, bbls. 110,600; corn meal, do. 4,605; wheat, bush., 903,530, corn, do. 559,250; oats do. 469,700; rye, do. 3,672; malt, do. 55,000; barley, do. 79,710; beans, do., 2,960 rice, pkgs. 828.

Exports for week, flour, bbls. 77 500; corn meal, do. 7,575; wheat, bush., 1,005 054; corn, do. 472,151; oats, do. 2,239; peas, do. 6,650, beans, pkgs. 497. rice do. 610.

CORN MEAL.—Quoted at $3,25 for Brandywine and $2.75@3.25 for yellow Western.

FRESH FRUITS.—Exports of apples for week 7,265 bbls.; since June 1st, 180,300 do.; same time last year, 85,800 do. Apples are plenty and dull for most grades. Some well kept Spys are retailing for $2.50. Baldwins and Russets range at $1.25@2.25. Cranberries quoted without sales at 75c.@$1.50. Hot-house grapes, black Hamburg, $2@2.50. Strawberries are very variable in condition; prime are worth 40@50c. ₩ qt., but many sell at 25@35c.; sift lots, 6@10c. Peanuts begin to move and prices are a shade better. Va. hand-picked 4¼@4¾c.; other, 3¾@4½c; shelled 3@3½c; pecans 7@8c.

GRAIN.—Wheat closed weak after an active week's business, with shipments for the week of 1,035,000 bush.; latest prices are for

No. 1 white at $1.23¾@1.24¼; do. April at $1.23@1.23¼; do. May at $1.19¾@1.20¼; do. June at $1 18@1.18½; No. 2 white at $1.21¼@1.21¾; ungraded white $1.20@1.23. No. 1 red at $1.23¼@1 30½; No. 2 red at $1.26¼@1.27½; do. April at $1.25¼@1.27¼; do. May at $1.21¾@1.22¾; do. June at $1.19¾@1.20¾; do, July at $1.18@1.18¾; No. 3 red at $1.23¾@1.23½; do. steamer at $1.12; ungraded red at $1.10@$1.29. No. 2 Chicago Spring at $1.24¾@1.25; No. 2 Northwest at $1.23.

Rye at $1.10@ .15.

Corn has been active and higher, but closed weak, with sales of

New York No. 2 at 63¼@63c; do. April at 63@64¼c., do May at 56¾@56¾c.; do, June at 54¾@54¾c.; do. July at 55¼c., No. 3 at 56¾@57¼c.; ungraded mixed Western at 57@64c; New York steamer mixed at 59½@60c.; New York yellow at 63c.

Oats have been in liberal demand and closed at for

No. 1 white at 53c.; New York No. 2 white at 50c.; No. 3 white at 48c.; New York No. 2 at 45¼@46c.; do. April at 45½c.; do. May at 44¾@44¼c.; do. June at 44¾@45c.; do. July at 45c.; NO 3 at 45c.; ungraded white Western at 46@51½c.; ungraded mixed Western at 44@46¾c.; No. 2 Chicago at 46c. asked.

HAY AND STRAW.—Offerings continue liberal of low grades for which prices are easy; prime hay is in fair demand, small receipts and firm. Quotations are as follows:

Prime timothy hay at $1.10@1.15 ₩ 100 lbs.; medium timothy at 95c.@$1.00 do., shipping grades at 85@90c. do.; clover mixed at 95c.@$1.00. clover at 80@85c. do. Straw—No. 1 rye at $1.05@1.10 ₩ 100 lbs.; No. 2 rye at 65@70c. do.; oat and wheat at 60@60c. do.

Exports for week, 2,314 bales; since Jan. 1, 1881, 26,237 do.; same time last year, 33,800 do.

HOPS.—Exports for the week only 220 bales. There is a dull shipping demand and moderate trade from brewers, but prices hold steady. Quotations are for

	Cents per lb	
New Yorks, crop 1880, choice	22	@23
Do. medium	19	@20
New Yorks, crop 1880, low to fair	12	@15

Pacific coast, new	19	@23
Bavarians	30	@35

Receipts for week, 938 bales.

Exports do., 280 do.

BEESWAX.—A small trade noted and a steady market, quoted at 25@25½c.

POULTRY AND GAME.—Prices are strong but the demand is limited to special buyers at this sum. Some remote packers begin to ship in ice.

Turkeys, prime fresh and frozen 18@19c.; good 16@18c.; large coarse 13@14c; chickens Spring 60@70c; Winter 50@55c; yearlings 18@20c.; good prime lots 16@17c; fowls, d. p. 15@16c.; scalded 13@16c. Capons, large, 28@30c.; small 25@27c. Ducks, choice, 25c.; other, 15@22c. Squabs, white, $4 ₩ doz. do. dark, $2.25@2 50.

Squab active in the absence of much game.

There is not much activity in hye as wants are small and about supplied by dressed. Prices are quite easy at the close.

Fowls, 12@13c.; roosters, 7@8c.; turkeys, 13@14c.; Spring chickens per pair, 75c.@$1.75; ducks, 87c.@$1.12; prime, 60@80c., other geese, $1@2; pigeons, 35@50c.

Game is of no moment. A few English snipe and plover, $1.75@2.

PROVISIONS.—Hog products have been more freely offered and prices weak.

Mess pork quoted at $16.00 for old and $17.75 for new, $17.25@17.50 for May delivery. Bacon at 8¾@9c. for long clear and 9¾ for short clear. Lard—Western steam at 10.62½ for May, 10.60@10.63½ for June, 10.67½ for July. Stearine at 13¾ Tallow at 6¼@6 9-16 for prime.

Receipts for week, beef, bbls. and tcs. 865; pork, bbls. 1,352; cut-meats, pkgs. 12,317; lard: do. 6,498.

Exports for week, beef bbls. and tcs., 1 130 pork, do. 3,878; cut-meats, lbs. 1,760,958; lard, do. 1,470,148.

SEED.—Clover is quiet at 8¼@9c. Timothy is inactive at $2 80@2 90.

TOBACCO.—Exporters have bought very moderately and the home trade has been without much animation with prices held steady. Quotations are for

Iowa, Ill., and Western X and XX, 34@36c.; No. 1, 40@42c.; No. 2 and common, 32@35c.; combing, 40@43c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, April 30, 1881.

BEEVES.—Receipts for the week 12 621 head; do. last week, 12,503 do. The later markets have been poor for drovers; some of them complained of losing $25@50 per car load. Butchers took fair quantities but trade was not animated enough to stiffen prices. Some trash, in the shape of poor steers, rough oxen and stags, were closed out at 8¾@9¼c., to dress 55@56 lbs., but sales generally of decent to strictly prime steers were from 9¾c., to dress 56 lbs., to 11¾c., to dress 57 lbs.; and a number of distillery and corn-fed bulls changed hands at 4¾@4¾c., live weight. The yards were not entirely cleared.

COWS AND CALVES.—The market has been a tame one even with light receipts; a good range is $30@55; selected singles from the quality now arriving, $60.

SWINE.—Receipts for the week, 28,016 head; do. last week 19 703 do. Western live corn fed have declined a shade within a day or day two. Prime light State hogs are doing well, other weights only steady.

Live corn fed $6.25@6.50 per 100 lbs.; city dressed State pork light, 8¾@9c.; medium, 8¼@8¾c.; heavy, 8@8¼c.; city dressed Western, 8½@8¾c.

VEAL CALVES.—The market has been heavily supplied during the week and prices for live or dead have ruled as at our last.

Live choice fat 6½c; fair to prime 5@6c.; poor 4@5c.; Mt. Holly, 6@7½c.; buttermilk 3@4c; hog dressed calves extra 8¼@9c.; fair to prime 6½@8c; poor 4@5c.

SHEEP AND LAMBS.—Receipts for week, 16,958 head; do last week 27,462 do. Supplies were very light and sales were quick. Unshorn sheep sold at $6.50@6.75 per 100; clipped $5.25@5.75; clipped yearlings $6.50. Spring lambs $3.50@6.50

FARMING FOR BOYS AND GIRLS—NO. 21.

HENRY STEWART.

Cultivated Crops.

If one should doubt the useful effects of cultivating crops, let him leave a few rows of potatoes or corn in a field to grow up with weeds, or with the soil hard and beaten with rains, or baked with the sun, and notice the effect as compared with the other rows that have been worked with the cultivator and the hoe. Every farmer knows how poor will be the crop unless it is well cultivated, and every farmer's boy knows it, too, although he may not very well understand the reason for it. It matters not what crop it may be; it may be corn or potatoes, or it may be an apple tree in the orchard or onions in the garden. A farmer who grew the largest crop of potatoes ever known, and received a large premium for it, said his success was owing to the fact that he hoed the crop every day. This may be true, because there is no doubt that without this constant stirring of the soil the manure used would not have been fully prepared for the complete nourishment of the crop; for the effect of the frequent cultivation of the soil is very varied. In the first place, it enables the air to circulate in the soil; next it enables moisture to penetrate to the roots; then it helps to attract moisture in a dry season and also helps to retain it in the soil; lastly, it prevents the growth of weeds. Let us consider how these effects are produced.

It is well known that when earth is moistened and spread and plastered and packed down tightly, the air will not penetrate it. We have heard of mud cabins, and many of us have either lived in log houses that have been chinked with mud, or we have known persons who have lived in them, and these houses are very warm and comfortable, although poor and humble. They are warm because the cold air is kept out, but if the mud becomes cracked and open and full of crevices, through which the wind passes, all the warmth and comfort is gone. It is precisely so with the surface of the soil. When this is beaten down and plastered and packed by the effect of rain storms and wind, the air cannot pass through it. The moisture-laden breezes blow over it without adding a particle to allay its drouth; the rains fall upon it and flow away without sinking into it; the hot sun dries and bakes it, and it is unable to support the life of a plant; because where air goes moisture goes with it—the air is never free from moisture. A cubic foot of air will dissolve or hold in suspension a cubic inch of water, but the power of air to hold water varies with its temperature. Very hot air will hold the most water, and as the air cools the moisture becomes condensed and appears as mist, gathers in drops on the leaves, grass, twigs of trees and the surface of the ground as dew, or falls in rain. Now, when the surface of the soil is loosened by cultivation and becomes warmed by the sun, the air in it is warmed, and dissolves moisture from as far below as the warmth reaches; then, when the soil is cooled in the night, and the air shrinks in cooling, air from without goes into the soil, carrying more vapor with it. This vapor is condensed and absorbed by the soil, and every warm Summer's night millions of gallons of water may be thus carried into the soil on a moderate-sized farm, and the crop is refreshed.

But this constant circulation of air has another effect. It meets with organic matter in the soil and this is acted upon by the oxygen of the air and decomposed. The air deprived of a part of its oxygen has then a surplus of nitrogen and we have reason to believe that in this oxidation of organic matter, nitrogen is left free and forms nitrates in the soil, and these have a most useful effect upon plant growth. So the circulation of air in the soil has both these useful effects. Then when a shower falls upon the loose soil how fast it sinks into it and becomes absorbed. This water forces out air and as it sinks and becomes absorbed, fresh air returns again so that the effect of the water is to help the air to exert its effects. And when this water has become spread through the loose soil and the space is then re-occupied by air, the great heat of the sun does not penetrate so far, to dry out this water, as it would if the soil were hard. So that the loose soil acts to let the water in and to keep it there when it has entered. Thus by cultivating the soil we keep it moist and make it fertile. We are manuring it in fact, for this tillage, in effect, produces elements of fertility in the soil that would not exist there without it. Therefore when we say tillage is manure, we only state a fact. Lastly we prevent weeds by cultivation. If we were to give a horse a feed of oats, and a dozen or two of rats should come and help him to eat them, as indeed some farmers permit them to do, that horse would become poor and thin. He would not thrive, because he had not enough food. It is precisely the same with a a hill of corn or potatoes. If we permit a dozen or two of weeds to feed with it, it is robbed of a portion of its food and becomes poor and weak. And it is to avoid this that we carefully cultivate these crops. Many farmers suppose this is all that they do by their work, but the other effects pointed out are far more beneficial to the crop and of far greater advantage to the soil.

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

ALICE P. ADAMS.

The Citrus Fair.

"I AM so glad you happened to come in March," said Violet, "for the fair is next week, and I'm sure you will like to go."

"What kind of a fair is it? asked Daisy.

"Oh, it is not our regular display," said Mr. Erman, "where everything is exhibited, from a huge squash to a patchwork quilt; that comes in October, when it is out of season for oranges. So they determined to hold a Citrus Fair at Los Angeles this Spring, so that the people of Southern California might have an opportunity to compare the oranges and lemons of different localities. It is our first attempt at anything of the kind, but I think that everyone is determined to make it a success."

The fair opened Tuesday afternoon, and on Monday Mr. and Mrs. Erman and Bertram took a wagon-load to Los Angeles and stayed nearly all day arranging and setting in order. On Tuesday the whole family set off in the two-seated spring wagon.

"You haven't been in Los Angeles since the day you came, have you, Daisy? And that is two weeks ago. But you won't see much of the city to-day. Does the pavilion look very nice, mamma?" questioned Violet.

"I am not going to tell you anything about it. Surely you can wait a little longer, as we are almost there; and then you will like it all the better if you do not know just how everything is arranged."

Los Angeles is pre-eminently a city of hills, and on one of the loftiest hights the Horticuttural Pavilion is situated. This is a large building surmounted by two towers, and when finished the city will have just reason to be proud of it. In the meantime the indefatigable managers of the Horticultural Society are each year pushing the work toward completion.

Mr. Erman drove slowly up the winding road, but the summit was reached at last, the horses were cared for and our little party found themselves within the Pavilion.

"Oh, oh!" cried Daisy half under her breath.

"I supposed they would have a good many oranges in boxes and some on the tables, but I never thought the building would look like this," remarked Violet with her superior knowledge.

Well, it *was* a beautiful sight. Fruit and flowers seemed to be the order of the day. In the center was the sparkling fountain with plants tastefully disposed about the basin. Each pillar was twined with Monterey Cypress and English Ivy, intermingled with snowy callas, and everywhere was piled the golden fruit, which was arranged according to districts or settlements. "Where shall we begin? asked Daisy, "for I want to see every bit of it."

"You'd better commence with the San Gabriel display," said Bertram. "That is the most tastefully arranged, in my opinion, though I suppose I ought to say nothing, being an interested party. There it is," he continued, "just opposite the door at the further end of the building. Come and see how we have been working."

Certainly much time and labor had been expended, but the workers had the satisfaction of knowing that the result was well worth all their painstaking. In the center stood a Chinese pagoda made of oranges and sprays of English Ivy. Within it was an orange tree laden with fruit. Rustic hanging baskets filled with plants, and clusters of oranges were suspended from the sides. Noticeable among the latter was a cluster of seventeen Konah oranges exhibited by Mr. Erman—the largest cluster in the pavilion. Above the pagoda were the words "SAN GABRIEL," made of limes strung on wires—a pretty change from the ordinary placard

On either side of the pagoda were tables bordered with green and adorned with flowers, where plates of fine fruit were displayed. One table was for Mr. Erman exclusively, and on it were arranged many varieties, from the Dwarf Mandarin orange, hardly larger than the end of my thumb, to the Navel and Konah, thirteen and fourteen inches in circumference. And over all was the delightful fragrance of the orange blossoms, for they were lavishly used to adorn the golden fruit.

"Did all these come from our place, Bert?" asked Violet.

"Everything, my beloved sister, except the paper on the table; I believe that was procured at the printing office. But come, don't spend your whole day looking at our own productions. I know Daisy wants to see what other people can do."

On the other San Gabriel tables were to be found various additional fruits. There were the Japanese persimmons, some last year's pomegranates which well displayed their "keeping" qualities, large glossy citrons, some twigs bearing green almonds freshly picked from the tree, and huge pear-shaped oranges, nearly a foot in diameter, which elicited an exclamation of wonder from Daisy. "What *can* those be, Bert?"

"They are called the Pumalo orange, but are not fit to eat. People grow them for ornamental purposes." ("Delicate little ornaments they are," put in Violet.) "Then just beyond you see the Shaddock, which is round, although it belongs to the same class. Those are nearly as large as your head."

A little farther along were glasses of orango marmalade, and large glass cans of preserved lemon peel and citron. The latter was very fine, cut in halves and thickly sprinkled with sugar.

"Doesn't that look as if it would be delicious? Now I would like to set my teeth in it! Where did it come from?" and Violet bent over the table as she examined the label. "It's from Mrs. Dickson. I'm going down there before long and ask her to let me taste it, and get the recipe for mamma."

Farther on they found factory-preserved citron, but it was not as fine-looking as the confection prepared by their neighbor from San Gabriel.

"Now let's go to the Pasadena 'show,'" said Violet. "We know so many people there, and they always take so much pride in putting their best foot forward."—[To be continued.]

THE YOUNG QUERIST.

WILL G. M. R., Canada, and E. J. A., Guilford Centre, N. C., please send full name and address.

R. V., Bucklin, Mo., asks if the carnations sent out in the Seed Distributions are the garden carnations or the ever-blooming varieties.

ANS.—You can leave them out of doors or take them in the house as you choose. They are "ever-blooming" and with you will prove quite hardy.

J. W., New York, wishes to know if the Japan Red Bud is to be covered for the Winter immediately after transplanting from the pot.

ANS.—Our directions on this point were a little obscure. After four leaves appear transplant the plants but do not cover them until they are liable to be frost-bitten in the Fall. Then cover for the Winter.

The greatest nourishing tonic, appetizer, strengthener and curative on earth. Hop Bitters.

Miscellaneous.

KIDNEY-WORT

DOES WONDERFUL CURES! WHY?

Because it acts on the LIVER, BOWELS and KIDNEYS at the same time.

Because it cleanses the system of the poisonous humors that develope in Kidney and Urinary Diseases, Biliousness, Jaundice, Constipation, Piles, or in Rheumatism, Neuralgia, Nervous Disorders and Female Complaints.

SEE WHAT PEOPLE SAY:

Eugene B. Stork, of Junction City, Kansas, says, Kidney-Wort cured him after regular Physicians had been trying for four years.

Mrs. John Arnall, of Washington, Ohio, says her boy was given up to die by four prominent physicians and that he was afterwards cured by Kidney-Wort.

M. M. B. Goodwin, an editor in Chardon, Ohio, says he was not expected to live, being bloated beyond belief, but Kidney-Wort cured him.

Anna L. Jarrett of South Salem, N. Y., says that seven years suffering from kidney troubles and other complications was ended by the use of Kidney-Wort.

John D. Lawrence of Jackson, Tenn., suffered for years from liver and kidney troubles and after taking "barrels of other medicines," Kidney-Wort made him well.

Michael Coto of Montgomery Center, Vt., suffered eight years with kidney difficulty and was unable to work. Kidney-Wort made him "well as ever."

KIDNEY-WORT

PERMANENTLY CURES KIDNEY DISEASES, LIVER COMPLAINTS, Constipation and Piles.

It is put up in Dry Vegetable Form in tin cans, one package of which makes six quarts of medicine. Also in Liquid Form, very Concentrated, for those that cannot readily prepare it.

It acts with equal efficiency in either form.

GET IT AT THE DRUGGISTS. PRICE, $1.00

WELLS, RICHARDSON & Co., Prop's, BURLINGTON, VT.

(Will send the dry post-paid.)

STOCKBRIDGE MANURES

SEND FOR PAMPHLET.

These manures are the richest fertilizers now manufactured, and the best substitute for, and costing *much less* than guano, which is now practically out of the market. Unlike guano, they *are not stimulants* and *exhaustive*, but *permanent* and *lasting*, being composed of bone, potash, etc. You can draw at one load enough for 3 to 5 acres, or as much plant-food as is contained in 20 loads of ordinary straw manure. Corn, potatoes, hay, etc., are bringing such good prices that it will pay to use the Stockbridge extensively. If there is no local agent near you, send to us.

BOWKER FERTILIZER CO.

New Publications.

"FOR ORGANISTS."

ORGAN GEMS. ($2 50) By F. L. DAVENPORT.

ORGAN SELECTIONS. ($1.50) By PETERS.

BATISTE'S ORGAN VOLUNTARIES. $2.50.

BATISTE'S LAST COMPOSITIONS. $2.50.

ORGANIST'S RELIANCE. (10 Nos., each $1.25. Complete, $6.) By EUGENE THAYER.

ZUNDEL'S ORIGINAL ORGAN COMPOSITIONS. ($1.25.)

In these six well-made books will be found a very large number of voluntaries, some classical some new and light, but all good. Organists will be glad to use the longer ones intact, and to adopt the shorter compositions as themes from which to vary.

Billee Taylor, price reduced to 10cents.
Olivette, price reduced to 50 cents.

Johnson's New Method for Harmony.

($1.00.) By A. N. JOHNSON. "The best book in the world" (for its object), was the commendation bestowed by an enthusiastic pupil on a former book by the same author. However that may be, this is his newest treatise, and can hardly be excelled for plainness of explanation, ease and thoroughness. It does not attempt Counterpoint, or any of the higher problems of composition; but confines itself to those things that every organist, every good player, and every composer of "the people's music," ought to know.

OLIVER DITSON & CO., Boston.

C. H. DITSON & CO. 843 Broadway, New York. J. E. DITSON & CO. 1228 Chestnut St., Phila.

HENDERSON'S HANDBOOK OF PLANTS.

BY PETER HENDERSON.

This new work is a concise yet comprehensive Dictionary of Plants—embracing the botanical name, derivation, and the Linnæan and natural orders of all the leading genera of ornamental and useful plants up to the present time, together with all important species and varieties, with brief instructions for propagation and culture; and on nearly all important plants, such as the Rose in Flowers, Strawberry in Fruits, and Mushroom in Vegetables, instructions have been given at length, which are a plain relation of the methods in use in our own extensive business.

Henderson's Handbook of Plants is a large volume of 400 pages, handsomely bound in cloth, and will be mailed on receipt of $3.00.

PETER HENDERSON & CO.

35 Cortlandt St. New York.

CLOVER

To every farmer sending us his name, we will send free *The Clover Leaf*, a 4 page, 28 column farmers' paper, full of valuable information on the culture and harvesting of clover for seed. When you write say where you saw this notice. Address BIRDSELL MANUFACTURING CO., South Bend, Ind.

PERSONAL ITEMS.

Mrs. Abraham Lincoln is now in Illinois, but will soon return to her former home in Pau, France.

Gen. Louis Von Benedek, the Austrian commander in the war of 1866, died at Gratz, Austria, Wednesday.

Vanderbilt has made another little investment of $5,000,000 in government bonds—part of the spoils of the late telegraph deal?

Dr. Kidd, who was Lord Beaconsfield's regular physician, has the largest regular practice in London, and is an eclectic. With the exception of this gentleman, it is a curious circumstance that all around the bedside of the dying ex-Premier.—Dr. Quain, Lord Burrington, Lord Rowton, James McClennan, his servant, and the two nurses—were Irish, "the sentimental and self-sacrificing race," as he has styled them.

[Freeport, (Ill.) Bulletin.]

There is now a substance which is both professionally and popularly indorsed and concerning which, Mr. J. B. Ferschweiler, Butteville, Oregon, writes: I have often read of the many cures effected by St. Jacobs Oil, and was persuaded to try the remedy myself. I was a sufferer from rheumatism, and experienced great pains, my leg being so swollen that I could not move it. I procured St Jacobs Oil, used it freely and was cured.

Why Do We Droop?

The vicissitudes of climate, the wear and tear of business, the griefs, cares and anxieties that beset us in every walk of life, sufficiently account for the premature debility and decay so common among all classes in this country. Strange, very strange it is, that with that potent vegetable invigorant, Hostetter's Stomach Bitters, within the reach of all, any one of us should forego the health, vigor and vital activity which its regular use imparts. Its effect upon the weakened stomach, the relaxed nerves, the torpid liver, the corrupted blood, the depressed spirits, is more salutary, refreshing and cheering than words can express. It is a medicine alike for the body and the mind, pure and wholesome in its composition, harmless in its operations, and permanent in its restorative results.

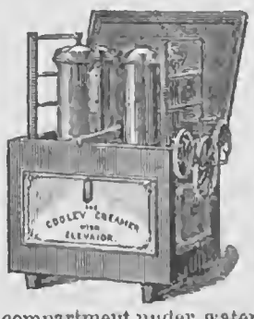
Box 841, Corning, N. Y.

COOLEY CREAMER.
GOLD MEDAL, PARIS, 1879.



Butter made by this Process was awarded **Sweepstakes** at International Dairy Fair, 1878, and **Gold Medal** at same Fair, 1879.
Gold Medal at Royal Agricultural Exhibition, London, 1879.
Manufactured in four styles and ten sizes.
The Regular.—The cans in this, removed to bench for skimming automatically
The Junior.—Skimming done automatically without removing cans. The Upright or Cabinet.—Has a compartment under water tank, the illuminated conical point of cans projecting into this compartment, skims without removing cans.
The Elevator.—Has a hoisting arrangement for raising cans out of tank. Milk drawn off automatically before removing cans form platform of elevator.
They require no milk-room. They raise all of cream between milkings. Impure air, dust or flies cannot reach milk set in them. The cans are submerged and water sealed in each style.
Each style has transparent panes for the purpose of determining when the milk is out, and cream about to flow. Our patents cover these processes.
No others have a right to use them.
Send for "Dairyman" giving particulars.

The Horseman.

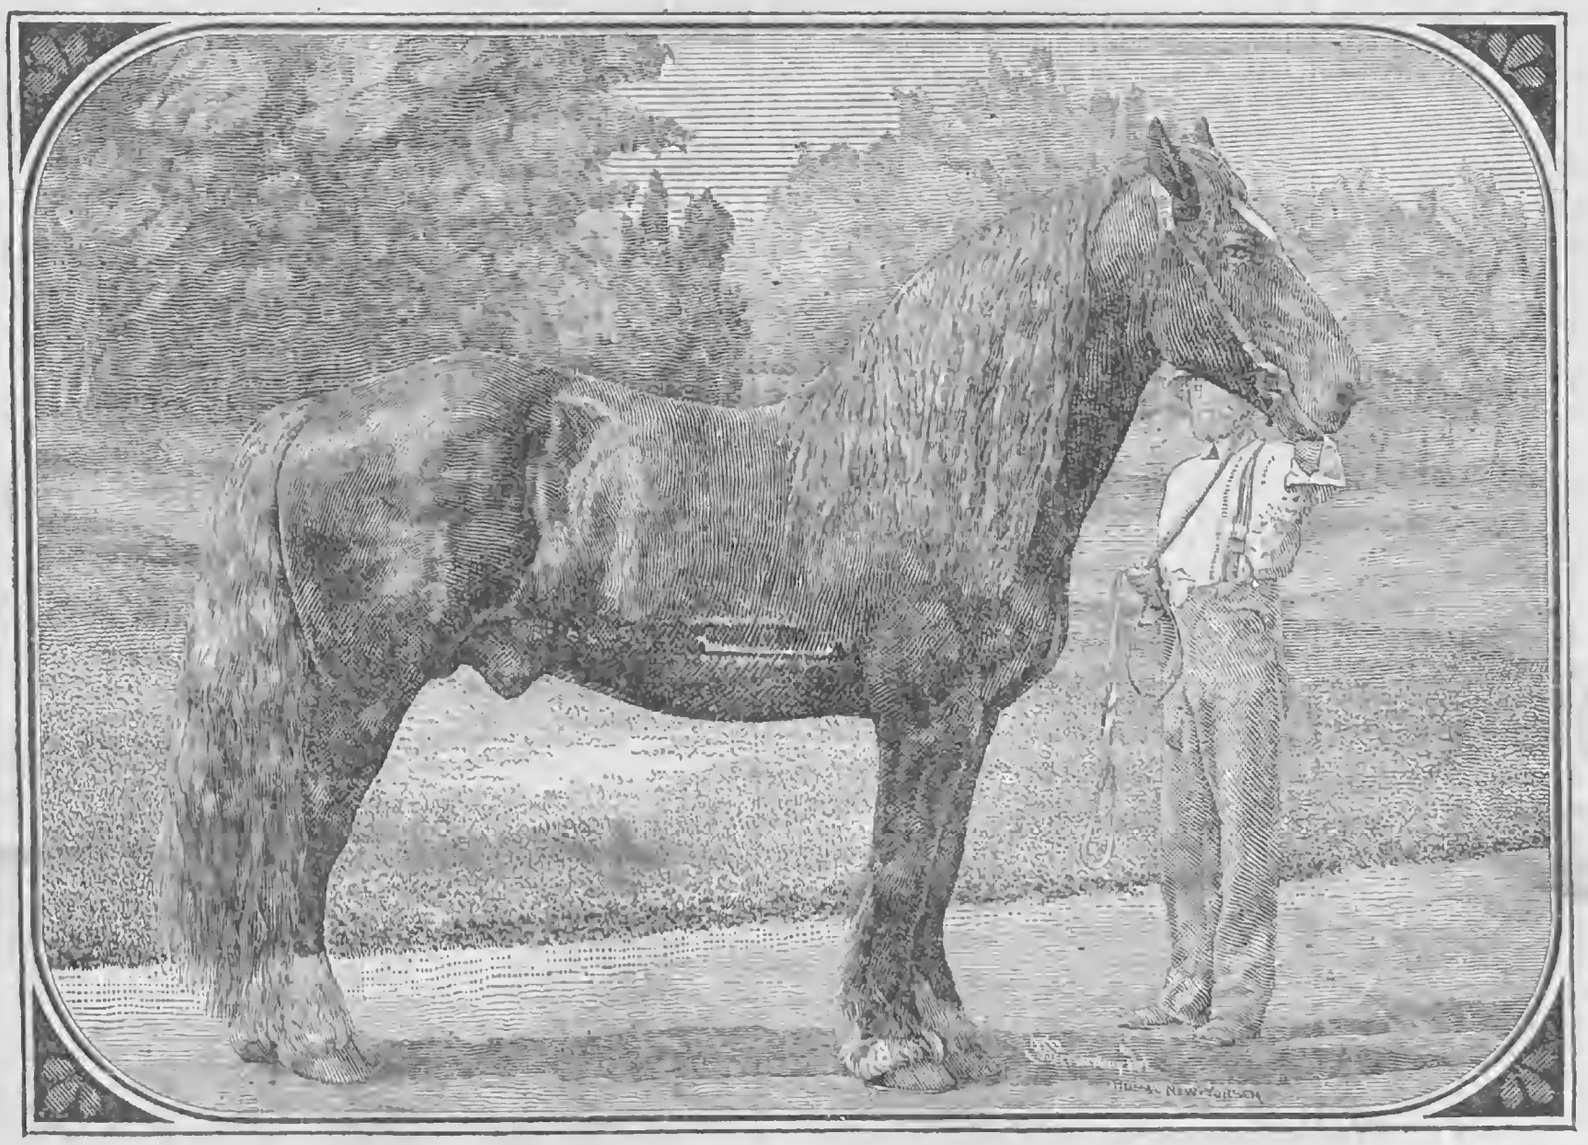
MOST PROFITABLE FARM HORSES.

AN interesting question to every farmer who rears even a single foal is, What sort of horse will it pay me best to breed? and the interest should increase with the number bred. In bringing up a colt or filly a fair measure of good feeding and care is, of course, needed to produce satisfactory results with any animal, and even with the best bred one the lack of these is pretty sure to disappoint any hopes of a profitable horse. Fair attention, however, being stipulated, what is the difference in the expense of rearing a horse which can either do excellent work on the farm or be sold for a highly remunerative figure, and one that will "eat his head off" on the farm and which cannot be sold for the cost of rearing him? The extra cost of service of a stallion good enough to beget the superior animal is a mere trifle in comparison with the higher value of his progeny on the farm or in the market. What sort of horse, then, will it pay a farmer best to breed?

Not a trotter, certainly. To train a horse, even of suitable descent and capacity for speed on the trotting track, so as to develop his powers in that line, demands much more skill, time and patience than are at the command of the ordinary farmer who attends properly to his legitimate duties. Moreover, even with the best management on the farm not one horse out of a score intended for speeding would ever repay the outlay upon it. Few of the large establishments specially devoted to the production of flyers, and possessing the best skill and conveniences, would make expenses if they confined their efforts exclusively to that line of business. No; the trotter decidedly is not a profitable horse for the farmer to breed; but carriage and heavy draft horses are. Both of these kinds are scarce in all our large cities, and the demand for them, being constantly greater than the supply, prices are always remunerative. Indeed, it is very likely that for years to come no sort of farm stock will be more profitable than horses of these two classes. The first should be from 16 to 17 hands high, and weigh from 1,200 to 1,300 pounds, and the second from 16 to 17½ hands, and not less than 1,400 or over 1,800 pounds.

The carriage horse should have a good share of thoroughbred blood in his veins, otherwise he will be deficient in the style, spirit, action and endurance which constitute the chief value of that class. In view of the small size of most of our draft horses, there is little doubt but the best way to remedy this defect is the employment of the best type of imported draft stallions. Among these the Percheron and the Clydesdale appear to be the best adapted to this country, either for the production of suitable heavy, pure-bred draft horses or for the improvement of our common native animals by crossing. Both of these breeds have been largely imported and tested in the Eastern as well as in the Western States, and both have many warm friends and supporters; but the Percheron, probably in great part through carelessness in selecting choice animals for shipment, appears to be losing ground, while its rival is steadily advancing in public favor. First-class Percherons seem to be rare among our importations of that breed; while a great deal of care appears to be taken to select only first-rate Clydesdales for importation.

In the RURAL of March 26th a brief sketch of the history of the Clydesdale breed was given, together with a short description of a typical animal. We here again present to our readers a likeness of a choice specimen of the breed, Donside Champion, one of the importations of Messrs. Smiths & Powell, of Syracuse, N. Y. Within the last 20 or 30 years constant study and care have greatly improved this breed in its native land, and removed nearly all the defects and blemishes which were to be met with among many of the Clydes of a quarter of a century ago. The principal objection still urged here against them refers to what in their native land is considered a sign of excellence—the hair on the back of their legs. This, it is said—and justly, too—has a tendency to superinduce "grease," and the English Clydesdale Stud-Book acknowledges that short, coarse, matted hair decidedly suggests the disagreeable ailment; but, as it also remarks, the high value set upon nice silky hair is on account of its being in all cases a certain indication of a strong, healthy bone. Of course, Clydes are also more or less liable to most of the other ails horse-flesh is heir to; but, all in all, we know of no breed of heavy draft horses more valuable on the farm, either as pure-breds or to improve our native horses.



DONSIDE CHAMPION.—From a Photograph.—Fig. 240.

Dairy Husbandry.

DAIRYING ON 24 ACRES.

AGRICOLA, Morris Co., N. J., writes: "I have a farm of 24 acres in six fields: Field A, four acres, good meadow, overflowed each Spring; fields, B and C, three acres each, poor pasture; field D., four acres, poor clay loam; E, three acres fair clay loam; F, four acres, excellent clay loam — 10-year-old sod plowed up last Fall. Rocks abundant all over. I desire to keep a dairy and stock farm, besides selling grain. I should replace grain for my cattle by cotton-seed meal. Will you oblige me by stating: 1. what system of rotation would you advise; 2, how many cattle could be kept on the above; 3. will it be advisable to soil the cattle and take the poor pasture fields into tillage; 4, what grain will pay best."

ANS.—Agricola has laid out the points for a small treatise upon agriculture. The possibilities of that little farm would astonish its quiet neighborhood. We shall not attempt to develop them all. A dairy and stock farm with large exports of grain from 24 acres! Yes, this is all possible. And our friend has shadowed the road that might lead to its accomplishment. The stock should be fed upon rich grasses, supplemented largely with that albuminous and phosphatic bye-product, cotton-seed meal; but not be restricted to this alone, (as nature and animals love variety). Let the food they eat than is generally supposed. If kept for growth or fattening, the toll taken is only to produce the extra weight of flesh and bones, or, if for the production of milk, it is only the nitrogenous and mineral substances of the milk that are supplied from the food and lost to the land, even if the milk be sold; and if only butter be sold, then only the bones and flesh of the young animals grown by skimmed milk are lost to the land. The food that is taken to supply the waste of the animal body is merely exchanged for the waste of muscle and bone, which passes into the droppings and is ready again to be converted into new crops of food. Nature is always forming new combinations and dissolving old ones, but the elements are all preserved, nothing is lost. When stock feeders shall learn to save and scrupulously apply all the droppings, both liquid and solid, from their animals, then will the land remain fertile for the coming generations; and when large amounts of nitrogenous and phosphoric food are purchased and fed to animals upon the land, its fertility will rapidly increase. And now to the questions.

The system upon this farm must be wholly the grass system; "all flesh is grass," and this is to be a stock farm. Turn no furrow in a field that yields a large crop of grass. Everything should be done to provide the fertility requisite to the growth of grass. Perennial grass is king. No other crop pays as much clear profit.

Let us examine this point. In the Woburn experiments, Timothy Grass grown on a clay loam produced, at flowering, a little over 40,000 pounds green per acre. This is what may be done on Agricola's land when all the conditions are the most favorable; but let us estimate one-half of this (20,000 pounds) or three and one-half tons of hay. This would have a value in the barn, on the average of ten years, of $15 per ton, or $53.50 per acre. The cost of cutting this and putting it in the barn need not exceed $7.50 per acre, leaving a profit of $45 per acre; or, if fed to a cow, it would furnish her a ration of 10 pounds for every day in the year. Three pounds of cotton-seed or linseed meal added to this would furnish a complete ration for milk, and ought to produce 2,800 quarts, which should bring, at the farm, $84. The manure, if estimated at two-thirds of the standard fixed by Dr. Lawes, would be worth $22.50, and would be much cheaper at that price than commercial fertilizers yielding the same amount of nitrogen, phosphoric acid and potash. The extra food beyond the hay would cost about $15, leaving $7.50 to be added to the product of the cow. If $20 are allowed to balance the labor account per cow, it would leave $70 as the clear product of the hay crop per acre, when fed to good milch cows, or if the manure is not counted, a profit still of $50 per acre. Now, if we estimate 40 bushels of barley, 60 bushels of oats, 35 bushels of

wheat or 50 bushels of Indian corn per acre, no such clear profit can be obtained from either of these. For feeding purposes the clover crop will pay somewhat better than Timothy, easily yielding in two crops three and one-half tons. In feeding this, 15 pounds of clover per day and eight pounds of wheat middlings, or five pounds of middlings and three pounds of corn meal, will make an unsurpassed ration for the production of milk, and one acre will furnish one cow clover for 465 days.

Orchard Grass and clover will give several cuttings, yielding three and one-half tons per acre, and which may be fed to equal advantage. Where the land is in good condition oats and peas drilled together (one bushel of oats with two of peas per acre) will produce a valuable crop to feed green or to cure into hay when in blossom. One acre will feed 12 cows 30 days, but it will become too ripe, and a portion must be cured for hay, in blossom. In seeding to permanent meadows seek a variety of grasses.

As this is to be a stock farm, when a field is to be seeded, instead of a regular grain crop, take one of the following methods: Sow Winter rye in the last of August or first of September. If it should grow rank in the Fall, turn the cows in an hour or two in a day and let them feed it off as evenly as possible, but not short. Seed it with Timothy and other perennial grasses at the time of seeding the rye. Early in the Spring sow six pounds of clover seed and run a smoothing harrow over it. This will help the grass seed and cause the rye to tiller. Cut this rye for green soiling, beginning before it reaches the head, and this part of the field you may cut again. The second cutting is often heavy. The Germans cut Winter rye two to four times, as they never allow the head to appear except at the last cutting. If land is plowed for a corn crop, this may be followed with rye the same year. By using the system of flat cultivation in the corn, rye may be sown among the corn at the last cultivation, and it will become well set before cutting the corn, and grass seed may be sown with the rye. If, on plowing up a meadow, a crop of oats and peas is first taken, rye may be sown after this crop is taken off. Rye is one of the best crops with which to seed to grass.

2. It will be seen from the answer to the first question that when these 24 acres are put in proper condition, 24 cows may easily be kept with the aid of a small amount of cotton-seed and linseed meal, middlings, etc. And, besides this, if butter is made, six to ten calves may be kept to eat the refuse milk, and these may be sold at $20 per head when six months old.

3. Soiling or stable-feeding will be absolutely necessary to success, and the means to do this are pointed out above. Winter rye, clover, oats and peas, fodder corn, millet, and the meadow grasses in their season, will be the soiling crops. That this system may be successful, there must be no failure in the saving of manure, both liquid and solid. And the best way to do this, in dairying, is to place the cows upon a self-cleaning platform, which will keep them clean and deposit the manure in a water-tight receptacle below. The old style of throwing the manure into piles, allowing it to soak into the ground, exhale into the air and be washed away by rains, will defeat the effort to enrich the land so as to raise those large crops. The liquid and solid should be carried to the field together, and applied in Fall and Spring as a top-dressing, and in the heat of Summer to the growing corn crop or the fallow and be cultivated in. Applied fresh to the growing corn, followed by the cultivator, the liquid will take an immediate effect, and all will be absorbed by the soil. We have tested this for several years and found it satisfactory.

The system of ensilage appears now likely to be a great aid to soiling, and will enable small stock farms to carry a much larger proportion of stock. It is, no doubt, quite possible, under this system, to carry 36 head of cows on these 24 acres, and get a maximum yield of milk.

THE DAIRY COW. NO. 32.

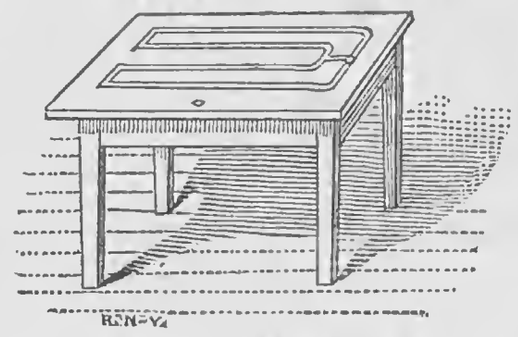
HENRY STEWART.

Home and Fancy Dairies.

The dairy of one or two cows may become a veritable creamery, if the owner wishes it. That is, it may be so arranged that to the family supply of butter may be added a supply of cheese of various kinds, to be eaten fresh or kept for future use. For there are times when the fresh cow gives more milk than can be consumed, and the waste of a large quantity of skimmed milk left after the butter is made, is a source of regret to the economical housewife. Instead, then, of throwing away this useful article of food, it may be made up into several agreeable forms and kinds of cheese. When a domestic calf is sent to the butcher, fattened for veal, the stomach should be recovered and preserved and made into rennet, as has been particularly described in a previous article, for use in cheese making. Some kinds of cheese may be made without rennet by merely coagulating the sour milk by heat, but the tender curd that may be cured with the soft, rich, butter flavor requires t be made with rennet.

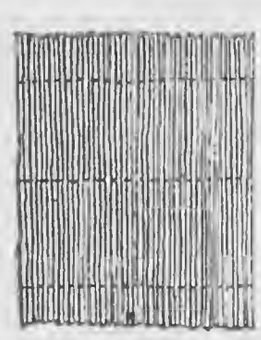
Pot Cheese.

The simplest form of domestic cheese is the "pot cheese." This is made of curd from sour skimmed milk gradually heated to 100 degrees, when the whey separates. The curd is dipped into a square of thin muslin gathered into a loose bag and hung up on a convenient hook or to a peg purposely placed in a hole made

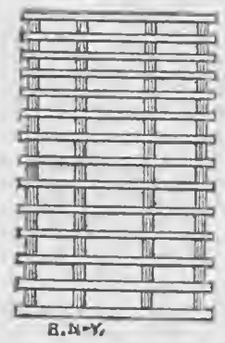


DRAINING TABLE.—FIG. 241.

for it near the edge of the draining table, Fig. 241. This is a common table with a white-wood or maple top, in which a few grooves are cut leading to a drain hole, as shown; a pail placed under the drain will serve to catch the drip from the table. The cloth containing the curd hangs from the edge of the table and drains into the pail. The curd may be pressed slightly in small hoops and sprinkled with salt on both sides; then placed on a mat made of green rushes sown together as shown at Fig. 242, and turned three or four times a day for four days and salted slightly once a day on each side. These cheeses may be kept for some weeks to cure and will acquire a very fine flavor. The curd may be kept in the cloth for two or three days and each day an additional quantity may be made until sufficient is gathered to make a cheese of several pounds, when the whole of the curd may be put together for a few min-



RUSH MAT. FIG. 242.

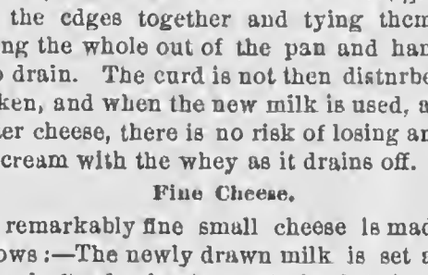


CURING FRAME. FIG. 243.

utes into warm whey and then put to press together. Curd may be made in the cloth, by laying this in the pan in which the milk is curdled, and when the curd is formed, gathering the edges together and tying them and lifting the whole out of the pan and hanging it to drain. The curd is not then disturbed or broken, and when the new milk is used, as for better cheese, there is no risk of losing any of the cream with the whey as it drains off.

Fine Cheese.

A remarkably fine small cheese is made as follows:—The newly drawn milk is set away to cool after having been strained twice and poured from one pail to another to air it thoroughly. After three hours it is slowly heated until the usual pellicle forms upon its surface. When the pellicle is firm enough to be lifted, the milk is removed and one teaspoonful of rennet is added and stirred in to 20 quarts of milk. The evening's milk may be skimmed and warmed in a separate vessel, to the right point, and then mixed with the morning's milk, and the rennet added. Or, by keeping the milk in ice water in deep pails, it may be preserved sweet for two or three days and then made into cheese; or the curd may be kept as above mentioned and added to the new curd, in which case the rich quality of the cheese may be preserved. The milk may be curdled in a large jar or tin pail or in several of them, and the curd may be carefully lifted with a common dipper or ladle, and placed at once in small cylindrical molds of tin, Fig. 244. Empty fruit cans, from which the top and bottom have been melted, and which have been cut down to four inches in length, will serve the purpose



TIN CHEESE MOLD.—FIG. 244.

very well. From five to six hours are required to form the curd. The molds are filled with the curd as they stand on the rush mats on the draining table before described; the whey gradually flows away and in two days the cheeses will have become firm enough for the mold to be lifted off from them. The cheeses are sprinkled with salt and left on the mats for three or four days, when they will be ready for the curing. This may be done on a shelf of narrow laths placed six inches apart. The cheeses are placed on a frame of laths shown at Fig. 243; the frame being kept on the shelf, but removed to the table when it is necessary to salt and turn the cheeses. The cheese during the curing should be exposed to abundant currents of air, for it is on this airing that the effect of the curing depends. It is this system of curing which gives the exquisite flavor to the small foreign cheeses, as the Roquefort, the Camembert, and others, and these are precisely the kinds that can be made very well in family dairies, or in other small dairies where a dozen cows are kept.

The cheeses in such a process of curing require to be turned every second day for three or four weeks. If mold gathers on them it is wiped off, and when moisture is perceived upon the surface this stage of curing is completed. The cheeses and the frame are then removed to a dry, close cellar, where they are kept for one month, being turned every second day. The cheeses at this period will have shrunk to one inch in thickness and three in diameter. If they are kept after this they should be wrapped in paraffine paper or tin-foil. The delicious English Stilton cheeses, weighing from eight to twelve pounds, and six or seven inches in diameter by nine or ten in hight, are made in this manner, but with the addition of cream to the new milk. The milk of Jersey cows, having 20 per cent. of cream, would make a very rich cheese, and if the curing were as well done, it would equal this famed English cheese.

Fancy Cheeses.

The Stilton cheese is one specially suited to a small dairy. It is made in the following manner, to which all its peculiarity is due:—A strong brine is made of salt and cold water and a number of sweet herbs, thyme, hyssop, sweet briar, marjoram, dill and savory, tied in bunches, are steeped in it with a few whole pepper-corns, for four days, when the clear liquor is racked off. The calves' stomachs are steeped in this brine for five days, when the rennet is kept for use. The morning's new milk is mixed with the cream of the previous evening's milk in a narrow, deep pail. The milk is heated to 90 degrees, and the rennet added. The pail is lined with a cloth, so that when the curd is formed it can be lifted out without breaking and placed in the mold. The curd is set in a warm, airy room. The mold is pierced with small holes to permit the whey to drain off without pressure; after a short time a light pressure is made upon the curd. When the cheese has sufficient consistence it is removed from the hoop and bound with a cloth, which is changed and tightened every day as the cheese shrinks. It is turned and wiped daily. When the crust is firm the cloth is removed and the surface of the cheese is brushed twice a day for three months. It is then placed in the curing-room, where it is kept to ripen for a year or 18 months. No salt is used in making this cheese. Veins of green and blue mold are formed in the cheese by thrusting into it thin skewers which have been rubbed with some old cheese in which the mold has been developed; the mold spreads from these places through the body of the cheese, giving it a peculiar marbled appearance.

Sage cheese is another kind that may be made in a small dairy. This is also known as green cheese. For a cheese of eight pounds two large handfuls of green sage and half as much parsley and marigold leaves are bruised and infused over-night in a portion of new milk. The colored milk is added to one-third of the milk to be curdled, and this and the rest of the milk are curdled separately. The curds are drained, scalded and broken in the usual manner of the Cheddar system, and the colored curd is then mixed, either evenly or in various shapes and devices, with the other curd as it is placed in the hoop. Much ingenuity is sometimes exercised in forming these devices by means of appropriate cutters and molds, and incorporating them with the white curd. The cheese is pressed and cured in the usual manner. Small green cheeses are made by bruising young sage leaves and spinach leaves in equal parts in a mortar and squeezing out the juice. The juice is added to the milk before the rennet is mixed, and the curd being formed, it is carefully broken very evenly, and put to press with gentle pressure for five or six hours. It is salted twice a day for five days and turned daily for 40 days, when it is ready for use. This is a delicious cheese when made of rich milk and skillfully handled. It is made of small size, weighing less than one pound.

The Herdsman.

NOTES BY A STOCKMAN.

Mr. Talcott is a very good defender of his views upon the question at issue between us, viz.: the merits of occasional and judicious close breeding, but he is a special pleader so far as he greatly extends my statements and makes me say more than I have said, so that he may have a more excellent chance to argue for his own case. He would make as good a lawyer as he is a breeder and a writer. Let us go back to the starting point and confine this question to what I really did state at the onset, and to the idea I intended to convey, and perhaps Mr. Talcott and I may shake hands and agree to differ in peace. I want farmers to believe that sometimes they need not fear to use a closely related male animal on their stock, for the reason that such close breeding has very often been found to be useful in perpetuating and fixing the good qualities of the parents upon the progeny. I don't advise farmers to go into line breeding to found new races or families, for then they may be "playing with edged tools" that have sometimes cut the fingers of professional breeders.

But when a farmer has procured a costly bull in the attempt to improve his dairy stock, or a high-priced ram for his flock, I would have him consider and believe that he will be safer in using this animal on his own progeny, for two or even three generations, than to cast aside his good animal and run the risks of bringing in another which may cause him to lose all he has gained. Further, I would have a farmer study the principles of breeding and its history, and act with knowledge and intelligence in this matter, rather than to imbibe a prejudice and find himself frightened and tormented with any bugbear (I think I once used this word in this connection) whatever.

It is said "a little learning is a dangerous thing." That is a poetical foolishness. The poet did not mean what these words convey, at least on the surface. He had to sacrifice sense to sound in a measure, or he might have said "ignorance is a dangerous thing," for that is the real meaning Pope intended to convey. We are in more danger from what we don't know than from what we do know, and I would therefore recommend every farmer, especially him who wants to improve his stock, to study the history and practice of breeding as well as the science and practice of feeding. The former is the foundation on which he must build; the latter the materials with which he builds. But let him be liberal in his views of things. Cannot we shake hands on this, brother Talcott? And by all means let us work together towards this end. There is too much work to be done by the army of Rural writers and teachers in helping the world of rural workers, to lose time over differences of opinion upon subjects which can never be reduced to rule and tape-line and arithmetic; and differences which can never be adjusted.

Shepherds ought to rejoice at the prospect before them, and yet "rejoice with fear and trembling." Consider the following figures: The last quarterly report of the Bureau of Statistics shows the quantities and values of raw wool imported into the United States from foreign countries from 1875 to 1880 inclusive. The totals are as follows:

Fiscal Year—	Pounds.	Value.
1875	54,901,760	$11,071,259
1876	44,642,836	8,247,617
1877	47,171,192	7,156,944
1878	48,449,679	8,363,016
1879	39,005,155	5,034,545
1880	128,131,747	23,727,650

An increase of nearly 90 million pounds and 19 million dollars' worth of wool in one year's imports. Nearly $24,000,000 are the prize which American sheep owners have to contend for, and with a handsome bonus in the shape of a tariff on foreign wool, we certainly ought to thrive. But let us make haste slowly and surely; it is wool and mutton we want; not fancy strains of this or that stock, but every-day sheep which can be kept at a profit with wool at 40 cents per pound. Sheep keepers should study the market reports closely and they will find that the staples of the markets are the domestic wools known as XX and XXX, which are produced by the Merinos and their grades and crosses.

The business of cattle herding on the Western plains has received a serious check the past Winter. Much has been told about this business that has been false and delusive. Reports of great fortunes made in it have been rife, but the fortunes have been made by those who have sold out to new-comers or by those few who began at the beginning and who have had a series of fortunate years; but

"The third day comes a frost; a killing frost,"

and now everywhere tales of disaster and ruin are heard. Among the losers, Mr. Groom, of Kentucky, deserves special sympathy. Unfortunately cast ashore and wrecked in his Kentucky ventures by the sudden fall of the tide of the Short-horn flood of some years ago, he went out to Montana as the manager of a large English cattle adventure, and the past Winter has once more ruined his business. Many others have lost their all in the same manner.

The whole business of cattle and sheep herding on the plains, so much vaunted as one of great profit, is wrong at the foundation. It is cruelty to animals on the vastest scale. To herd hundreds of thousands of cattle on the

open plains without shelter and store of food, so that at the best, thousands are lost during the Winter by starvation and exposure, and at the worst, in a severe Winter as the past has been, whole herds are left to perish for want of food and water and shelter, seems a great cruelty and an enormous crime, in which man's greed brings vast pain and suffering to the unfortunate animals. The glamour and delusion are now over and the costly reality will perhaps bring its own remedy.

THE worst sufferers are the pure Short-horn bulls that have been taken to the plains to improve the hardier natives. These are reported to have been all but extinguished, and the damage is not confined to the present losses, but will extend to future years for want of progeny the coming season. After all, it gives a secure promise to farmers that the rearing of breeders will never be taken out of their hands by the semi-savage, pastoral herding sytsem of the plains. It therefore opens up to the farmers a steady business of the most profitable kind, and one that lies at the very basis of successful and improving agriculture; viz: the production of choice beef animals by means of stall feeding or partial grazing, in conjunction with grain and root raising.

THE Short-horn, Hereford and the Polled steers and the dairy cow, are the chief stars of the agricultural firmament which are about to come into conjunction. The live stock interests of America promise to become permanently paramount. Hereafter it would seem that to know how to feed one's products will be of even greater importance than to know how to grow them; for if a man can feed them successfully, the growing question will take care of itself, being helped by the most important element of plenty of manure.

IT follows, then, that if we can increase our yield of corn and grow roots in abundance, Eastern and Western and even Southern farmers can compete with the graziers of the plains in producing beef, mutton and wool. In view of this, the efforts of the editor of the RURAL NEW-YORKER to popularize improved methods of growing corn have a most useful bearing upon this, the grandest agricultural industry.

Field Crops.

EXPERIMENTS WITH POTATOES AND WHEAT.

A FRIEND, writing from Ottoville, Ohio, says: "I send you a trial paper of Italian Rye Grass; it can be sown either in the Spring or Fall, but, if sown in the Spring alone some of it will produce seed the first season, whereas, if sown with oats or other small grain, it will not do so. It is of a more spreading habit than Timothy here. I send you some specimens of seedling potatoes also. I selected them out of about 1,000 seedlings, and I think they are all very good varieties. I saw a remark in the RURAL about the Mammoth Pearl Potato having been selected out of 2,500 seedlings. I am not disposed to dispute it in the least, because I selected mine in the same way, I should judge. In selecting from seed I took the largest and those ripe the earliest the first season, and planted one or more of each; the second season I selected the best and planted them, and from these the varieties I send you were selected. It doesn't require a large farm to grow a large number in this way; a small patch is sufficient. I have managed my experiments with wheat as follows: In 1877 I sowed two small patches adjoining each other, one with Smooth Ohio River Bottom Wheat and the other with Bearded Wool Wheat, selected seed. In 1878 I selected the best ears of both patches and sowed the grain from them close together again, and also a patch of Bearded Egyptian Wheat. In 1879 I had Bearded Wheat in the smooth and smooth in the Bearded patches. In the Fall of 1879 I sowed the best kernels of them close together, and in 1880 I had five distinct varieties out of three, none of which resembled the old kinds, but all had larger ears and were better filled and plumper kernels. Other varieties I have raised in the same way, but from different seed wheats. Moreover, I have three varieties I got from Europe, that I am trying to acclimatize. One of these does very well and stands the Winter well, but the others don't turn out well, yet they may after they become acclimatized. As yet I have not got beyond experiments."

REMARK.—It has been said, and we believe generally taken for granted, that wheats do not "cross," because the stigmas receive the pollen before the anthers appear outside of the pales and glumes. From several who have studied the matter we learn that there is good reason to doubt this theory and that different kinds of wheat *do* or may intercross.—EDS.

Reed Meadow Grass—Glyceria aquatica.

This tall grass grows three to five or more feet high, and thrives in wet grounds northward. The leaves are long, about half an inch wide, and flat. The panicle is much branched and is often 18 inches in length. The flowers appear in July. It may be sown on wet land, though it has seldom been tried in this country. The quality is thought to be excellent. The panicles of this grass are very ornamental and it is well worth cultivating for that purpose. The spikelets much resemble those of Briza, though they are much smaller.

PROF. W. J. BEAL.

SPIKELETS OF REED MEADOW GRASS.—FIG. 245.

What Shall be our Best Wheat?

Mr. Wysor, in a late number of the RURAL, attempts to answer this question, and probably does so satisfactorily for his locality. The RURAL has also, at different times, attempted to answer the same question. The two differ in conclusions, yet probably both are correct for their respective localities. No one kind will do well in all places. For this region (Northwestern Ohio) I think that the conclusions of the RURAL are about right. Clawson, Fultz and Shunmaker are the varieties commonly grown. Clawson is perhaps the most prolific, but it is more liable to spoil in the shock or bin and is almost always light in weight. Fultz is nearly, if not quite, as prolific as Clawson and is superior in every other respect. Shumaker is also well liked. I never like to depend on one variety only. This year I sowed both Fultz and Clawson. The Clawson will not be fit to cut until the Fultz is all harvested, thereby avoiding the waste always attending the cutting of overripe wheat. Why do not millers pay for wheat in proportion to its flouring qualities? The best flouring kinds are not usually prolific, but if sufficient difference were made in prices, farmers would as lief raise kinds satisfactory to the millers as to raise the Clawson, and then we might hear less complaint of poor flour. V. J. E.

Henry Co., Ohio.

[We should much like to know more of the flouring qualities of Shumaker. It is an admirable variety at the Rural Farm. EDS.]

REED MEADOW GRASS—GLYCERIA AQUATICA.—FIG. 246.

Farm Economy.

EXPERIENCE WITH ENSILAGE.

With others I was, last season, induced to experiment with ensilage. I built my silo 17x25 feet and eleven feet deep, so that it had a capacity for about 60 tons, and I nearly filled it from two acres of land. I experimented with different methods of sowing the corn—in rows, two feet, three feet, four feet apart and I used seed at the rate of from two bushels to one half bushel per acre. The conclusion I have arrived at is that I shall sow in rows four feet apart, and kernels from five to six inches apart in the row. I know it is cheaper to raise one five-pound stalk than five stalks of a pound each, and the larger you can get them the better they are, and the less liable to fall down. I put 230 one-horse loads into the silo readily, in the morning there was none left in the mangers. I fed once a day a ration of a bushel to each grown cow, together with one quart of cotton-seed meal, and hay once. After one week I gave ensilage only. I afterwards increased the grain to two quarts. Ever since I have fed 19 head of cattle, equal to 16 grown cows, exclusively upon ensilage, and I never had my cows look as well as they look this Spring, and the young stock which have had ensilage without grain have grown nicely. A few days since my "help" took a short vacation, and in the morning there was no ensilage out (I take it out 12 hours before using it so as to have it ferment), and I fed them hay which they refused and bellowed until they received the usual portion. The milk is unusually sweet, and the butter is very satisfactory to customers. I know I make more from the same number of cows than I ever did before, and that of better quality. I had enough ensilage to feed the stock to May 1st.

One piece of good land, well prepared, gave me a return of 60 tons to the acre by weight and measure. The stalks weighed from seven to eight pounds and were 14 feet high. I think my silo cost me, filled, nearly $500, and contained ensilage enough to keep one cow six years with a fair amount of grain, and this year with hay at $25, per ton, it is quite a help.

Bloomfield, Conn. D. W. THRALL.

Horticultural.

GARDEN HINTS.

SPRING work in the garden is backward this year; for that reason I find great advantage in having my plans laid during the Winter; seeds and necessary tools purchased, and, last but not least, manure and fertilizers all prepared. These form the ground-work of all good gardening; manure first and good cultivation afterward, is my rule. I use this year on one acre of ground about eight tons of stable manure which will cost me a dollar a ton. For fertilizers I shall pay:

8 tons stable manure	$8.00
400 lbs. of superphosphates	7.40
20 bushels of wood ashes	4.00
15 " of hen manure	3.00
Total	$22.40

With this amount of fertilizer I expect to carry through a double crop worth $500, and leave the ground in as good condition as at present. Where is the bank that will pay such a dividend? Truly the earth is kind to the husbandman. You will say I look entirely on the bright side—and I know of no reason why I should not. I am going to take the RURAL'S advice and put my seed in better prepared soil than ever before, for I have always noticed that it is the poorly prepared soil that suffers most from too little as well as from too much rain. I find there is a chance for a good deal of study in laying out an acre of ground, to plant to a variety of vegetables where two crops are expected in one season. Small vegetables that cannot be cultivated with a horse, should be separated from those that can. I leave a strip through the center of my garden, about one rod wide by 20 rods in length, which is occupied with beets, onions, salsify, parsnips, etc. The rest of the garden can be cultivated with a horse. I believe in planting hardy vegetables as soon as the ground can be worked after the first of April. I would not plant in February or March even if the ground was dry, as it would get entirely out of condition before the seed would germinate. Last Spring I planted some peas on March 5, and although they were three or four days earlier than those planted in the middle of April, they were not nearly as satisfactory a crop and did not stand the May drought as well. The soil had become hard, had become too good a conductor of moisture, had, in fact, conducted all the moisture from below off into the air. My theory is that if the soil near the surface is loose and broken, it acts the same as a mulch and prevents the moisture, that is continually coming from below, from passing off into the air except through the leaves of the plant.

[Stones, sticks, lumps of earth, etc., lying upon the surface arrest moisture. Sand arrests moisture. The pulverization of most productive soils, according to *our* theory, serves to *increase* evaporation, and the pulverized earth does *not* act as a mulch. More moisture (rain and dew) is admitted, and, as capillary action is more active, more moisture returns and passes off into the atmosphere. This theory, which we first advanced several years ago, as the teachings of a series of experiments, was widely discussed at that time. Eds.]

Raising radishes is an easy matter, if the right kind of soil can be obtained. A light yellow, sandy soil, about the consistency of molding sand, I consider the best, and the best fertilizer in my experience is wood ashes. The radish bed should be entirely free from stones, and no kind of stable manure should be used. The soil should be in condition to pack firmly together without being lumpy or inclined to bake. If these conditions are observed, the radishes will be of a handsome shape and ex-

tirely free from worms. They must not be planted in the open ground until the weather is settled and warm, as rapid growth is absolutely necessary in order to have first-class radishes. I usually mark the rows off about eight inches apart, cover the seed by drawing the back of a rake crosswise of the rows, and then pat the bed down with a shovel or spade, after which I dust the bed with wood ashes or soot, as this will protect the bed from the ravages of the Turnip Fly, which will sometimes penetrate the soil and destroy the seed as soon as sprouted. I have tried a good many varieties but still prefer the Long Scarlet.

Oneida Co., N. Y. ADELBERT WAKEFIELD.

LOSSES AND PLEASURES OF HORTICULTURAL EXPERIMENTS.

IN my horticultural pursuits I look to every possible source for light, and, taking the last year for an example, I have found the lessons from the RURAL NEW-YORKER more profitable on the culture and varieties of small fruits than those of any book or paper which is devoted to this special subject. I think every investigating amateur must lose in experiments, while his neighbors who go plodding in the beaten track do a safer and more profitable business. But I am sure I find more enjoyment, even in my failures, than I could possibly find in their dull routine. I lost $50 in planting Sharpless Strawberries before I found, from my own experiments, and from the later teachings of the RURAL NEW-YORKER, that this variety is of as little value for field culture on light soils as Great American or Jucunda. From the advice of the R. N-Y for 1879, I thought it was the coming berry, but I have gained enough knowledge of the adaptation of soil and varieties to more than compensate for the loss by the Sharpless. It cost me $800 to learn how to ship and handle evergreens, and even a small bed of lilies (five by twelve feet) has cost me over $30, and but one variety (Lancifolium) is left. I have tried nearly every tree and shrub in the market, which is considered hardy for this latitude, and have retained not over one-half. So, in the greenhouse I have discarded nearly one-half of my purchases as worthless. But in all these experiments I have no regrets for my failures, and should feel disappointed if there were no new trials to be made.

The Special No. of the RURAL on shrubs and trees was excellent, but in some respects it was incomplete, particularly in mentioning the hardiness of varieties. For instance, the Rose of Sharon will not stand our Winters at all, and the Tecoma radicans, the Deutzia, the Japan Quince and even Prairie Roses must be protected in severe Winters or there will be no blossoms. One would infer from the reading that Akebia quinata, Aristolochia Sipho, Magnolia glauca, Mahonia and Daphne Cneorum were hardy in this climate, where we have peaches (seedlings) nearly every year—100 miles directly west from Chicago. All the Japan Evergreens I have tried do well, but I think Retinispora plumosa (not aurea) is the finest of all. Irish and Swedish Junipers are eventually winter-killed, but the Pyramidal Arbor-vitæ is a good substitute. I have had no trouble in planting the tulip-tree, persimmon or chestnut. G. W.

Rock Falls, Ill.

REMARKS.—At the Rural Farm the Rose of Sharon (Hibiscus Syriacus) is winter-killed. The soil is gravelly and dry. At the Rural Grounds it has stood unharmed 20° below zero. Soil, clayey and moist. The Trumpet Flower (Tecoma radicans), Deutzias and Japan Quinces are never seriously harmed. We should certainly suppose Akebia quinata, Aristolochia Sipho (Pipe Vine) and Magnolia glauca would prove hardy in Illinois—even in the Northern boundary.

Floricultural.

A LILIPUTIAN FLOWER GARDEN.

A FEW years ago my husband leased some property near his place of business. As it was to be our home a few years, I determined to have a flower garden. About 14x23 feet was my limit, and I was told it was too small for anything, especially as it faced the north, and a two-story building shut out the eastern sun and threw on it a blinding heat in the afternoon. Late in May even it was damp and cold. But I began, marked out my plan, gathered cobble-stones to underlie the walks, and carried, in a tin pail, sand to cover them and prevent weeds from growing. As I had no rose-bush, I decided to obtain a small, dead peach tree and trim it to suit, and then transplant it into the center plot, A. At the foot I planted Madeira and Cypress Vines, which soon clothed the dead branches, and many a one inquired, "What is that beautiful tree?" A wreath of pansies, B, and a border of turf taken from the watercourse along the sidewalk, finished the center. Every bed was bordered with turf, cut with a table-knife in narrow widths, and kept trimmed with a pair of common shears. But the crowning feature was the motto; one year it was "Love at Home;" another year, "Home, sweet Home," and last, "Welcome Home." This was also made of the same sort of cut turf, trimmed with shears, and many a blister my borders cost my hands.

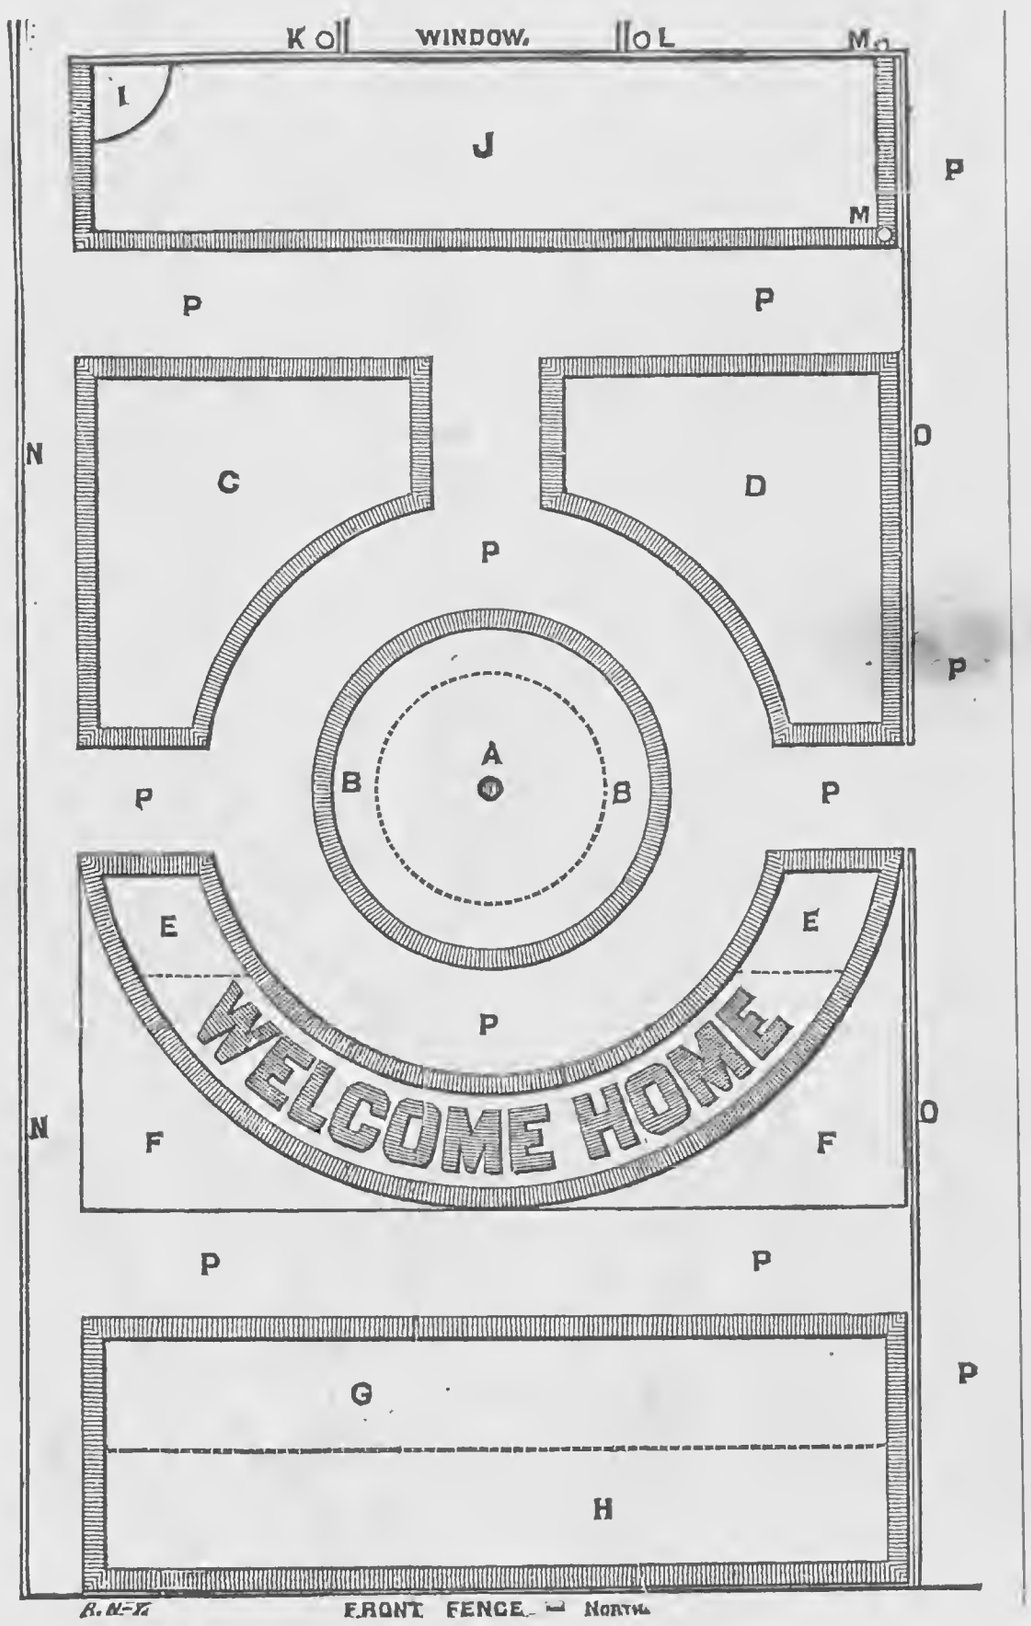
One Spring I was contemplating omitting it and having a bed of flowers instead. A little boy was looking over the fence.

"What motto are you going to have this year, Mrs. C.?"

"I don't know about the motto," I replied; "it makes more work than the flowers."

"Well," said he, "it's the prettiest part of the garden, and I'd rather help you than not to see it." So I took fresh courage. After the letters were all made, the fine sand sifted and spread between, little "Pansy Puller" said, "When brother comes home, he'll think that it's meant especially for him." Some months afterwards, as I was trimming off the fading pansies, some one said, "You're fond of flowers?" I looked up, and a sun-browned man was looking over the fence. Disinclined at first to answer the stranger, upon second thought I replied, as I picked a handful, "Yes, would you like a few?" and looking up in his face I met the laughing eyes of that long absent boy. "Was that motto put there for me?" So the little girl was right.

The vines, climbing on strings against the brick wall, N, prevented the glaring heat and refreshed the eye. The mignonette, H, under the fence, did not tempt little hands in passing, as brighter flowers would have done, and was just as sweet. Half a block east of us was a large hotel, on the same side-walk, and the hacks and omnibuses always showed their occupants looking our way.



PLAN FOR FLOWER BEDS.—FIG. 247.

A morning-glory trellis, O, walled in our garden on the west side, and then came the path from the front gate to the house and back-yard. This also was defined by a morning-glory trellis 56 feet long—our western boundary. Beautiful in the morning, shading our yard all day and inviting the hummingbirds all Summer, it was a continual delight. This joined a Summer bower, 12 feet square, of morning glories and scarlet runner beans, where the little ones kept house. An old Scotch gardener told me I had a wonderful amount of beauty in that small space, and the flowers were all common ones too. Where the two honeysuckles, M, M, are designated is the east side, and on the west side opposite, six feet distant, were two more which grew over an arch, thus forming a pretty entrance to the door-yard from the path. MRS. A. J. C.

Salt lake City, Utah.

A, Bed six feet in diameter, with dead peach tree in center for Cypress and Madeira Vines to climb on. B, Wreath of pansies. C, Jessamines and violets—mixed colors. D, Verbenas—mixed. E, Candy-tuft. F, Portulacas mixed. G, Larkspurs, pinks, bachelor's-buttons, marigolds and forget-me-nots. H, Mignonette bed. I, Canterbury Bells. J, China Asters—mixed. K, Madeira Vine. L, Ivy. M, Honeysuckle. N, Trellis of Sweet Peas trained against two-story brick building. O, Morning-glory trellis. P, Walk, two feet wide. The shaded portion represents a turf border six inches wide.

Plant Freezing.

As a jar of sirup or other dense liquid will resist frost longer than one of thin and simple water, so it has been found that the contents of the cells in plants do not congeal until after all the watery liquid in the spaces between the cells is frozen, and much of the watery part of the contents of the cells has exuded through the walls and become ice. If the frost continues beyond a certain limit the thick protoplasm within the cell succumbs, the cells themselves are ruptured and the injury is beyond remedy. Decay sets in. This explains why a degree of frost which throws the stems and leaves of a plant out of their normal form, as we see in celery on a cold morning in October, does not necessarily destroy the tissue, but allows the plant to recover on thawing, the cells reabsorbing enough of the water to mix with the condensed but unfrozen protoplasm. It also shows how much more danger of mortal rupture there is when the whole tissue is yet gorged with watery sap than if it is comparatively dry and at rest. W. G. W., SR.

The Vineyard.

THE SECRETARY GRAPE.

HAVING several times seen disparaging remarks about the Secretary Grape in the RURAL NEW-YORKER and in other papers, I beg space in the columns of the RURAL to correct some misstatements about it. I desire to see the Secretary and every other grape pass for just what each is, and nothing more. Some time ago I noticed in the RURAL a paragraph announcing that the Secretary was a failure at the Rural Grounds, and that it was intended to pull it out. This was not strange to me, for being so close to the sea, it could not reasonably be expected that anything in the grape line would succeed there except the iron-clads, and varieties that are perfect failures there in most cases succeed inland on soil and in situations favorable to the grape culture, and though this grape is a failure, it does not follow that it is so in other localities. [The Rural Grounds are 11 miles from the sea.—EDS.] To a certain extent this adaptability of a variety to special soils and situations holds good with all other grapes. The Catawba with me ripens to perfection nine times out of ten; while with my neighbor, less than a third of a mile from me, it fails to ripen three times out of five, and so it is, in my opinion, with most varieties. A variety that is successful in one locality often fails in another. Practice has long since proved this, and the only way to learn how a variety will succeed is to try it.

I also notice in the RURAL of April 16th a paragraph saying that W. C. Barry pronounces the Secretary a great failure, the fruit being small, the quality not so good as that of the Clinton, while the vine is styled a miserable grower, the foliage poor, etc. Mr. Barry does not say where it is a failure. Now I wish to say, in reply to Mr. Barry, that with only ordinary care and culture the fruit of the Secretary will compare favorably with that of the Catawba for size, and its quality is certainly better, and is so considered by Mr. Downing, who pronounced it one of Ricketts's best in quality, and it was so pronounced four or five years ago by others of the highest authority. Its habit of growth is somewhat slender, and the wood is short-jointed, and, as for hardiness, it stood 18° below zero the past Winter without protection. The foliage is somewhat inclined to mildew in bad seasons, but not more so than that of the Delaware and some of Rogers's. As for its quality, Mr. Barry is certainly mistaken. J. G. BURROW.

Fishkill, N. Y.

The Apiarian.

HOW TO HANDLE BEES.

SOME persons who would like to keep bees are dissuaded by the fear of stings, but they would not hesitate had they seen some experienced bee-keeper handle his bees. The worker bees are all armed with a dreadful sting—a weapon feared by everybody, and which was designed by nature to protect their race against extinction. Yet this weapon is but an instrument of defense. A bee, far from its hive, will never sting unless hurt. It is only near its habitation that a bee volunteers an attack, and only when it fears that its abode will be disturbed. Quick motion near the hives, such as running or walking fast, or fast movements of the arms are often considered menaces by the bees; hence it is always safer to locate the apiary in a secluded spot, far from frequented thoroughfares.

An experienced bee-keeper is rarely stung if he takes the trouble to use the usual means of quieting the bees before disturbing the interior of the hive. The best, I would say the only, medium to be used in the dealings with bees is smoke. There are now several good kinds of smoke, invented by Yankee geniuses, especially contrived to quiet bees. A few puffs of smoke at the entrance of the hive and a few more on the frames as soon as they are partially uncovered, are generally sufficient to pacify bees to such an extent that they allow the entire removal of their combs without the menace of a single sting. I say *generally*, for there are exceptions. Some colonies are more irascible than some others. Hybrid bees are noted for their anger. By hybrids I mean a cross between the peaceful Italians and the common bees. At times the most gentle bees cannot be easily controlled. Smoke is very offensive to bees; as soon as they smell it their instinct seems to inform them that they can be compelled to abandon their hive. Then they fill their sacs with honey, so as to have a provision of food to last till they find a new lodging; and as a bee well satiated, like a man after a good meal, is always of good temper, you can demolish the hive without a single sting.

But sometimes there is no honey in the hive, or there is so little of it that it is impossible for all the bees to reach it immediately. At such times the operations with bees are more difficult, and it is only with caution that you can open the hive. It is then necessary to give the bees some sirup and to wait until they have filled their empty stomachs. We can therefore say that when bees are harvesting honey they can be handled with the greatest facility, even, most of the time, without using any smoke; while during the time of scarcity they are more irascible. The quality of the honey harvested seems also to have some influence on the temper of bees. During the Spring crop, in April, May and June, they are very peaceable, while when they harvest the darker grades of honey, in Summer, they are more easily irritated.

There are some points that every bee-keeper should always keep in mind:—He should avoid carefully to stay in front of the hive, I mean in the line of flight of the bees. Every motion around the apiary, or while opening the hives, ought always to be slow, and every operation

with bees be made calmly; for a quick motion or a small jarring of the hive can be misapprehended as a menace by the bees, who would have remained quiet but for this unhappy accident. An irritated bee, unless very angry, announces its anger by quick flight around the head of the intruder. This anger is easily discernible by the strident sounds that the bee emits, being altogether different from the gentle humming of a bee going into the fields after honey. As soon as he hears this menacing language a skillful bee-keeper lowers his head, sends some more smoke inside the hive, and waits till the anger of the bee has subsided before resuming his operations. C. DADANT.

Industrial Implements.

A SUCCESSFUL IMPLEMENT FOR CULTIVATING CORN.

THE accompanying illustration shows a rlding corn cultivator at work. This machine is made by Edmiston & Waddell, 281 Greenwich St., New York City. The advantages of this riding cultivator, or, as it is more commonly called, sulky cultivator, have been demonstrated to the entire satisfaction of thousands of practical farmers all over the land.

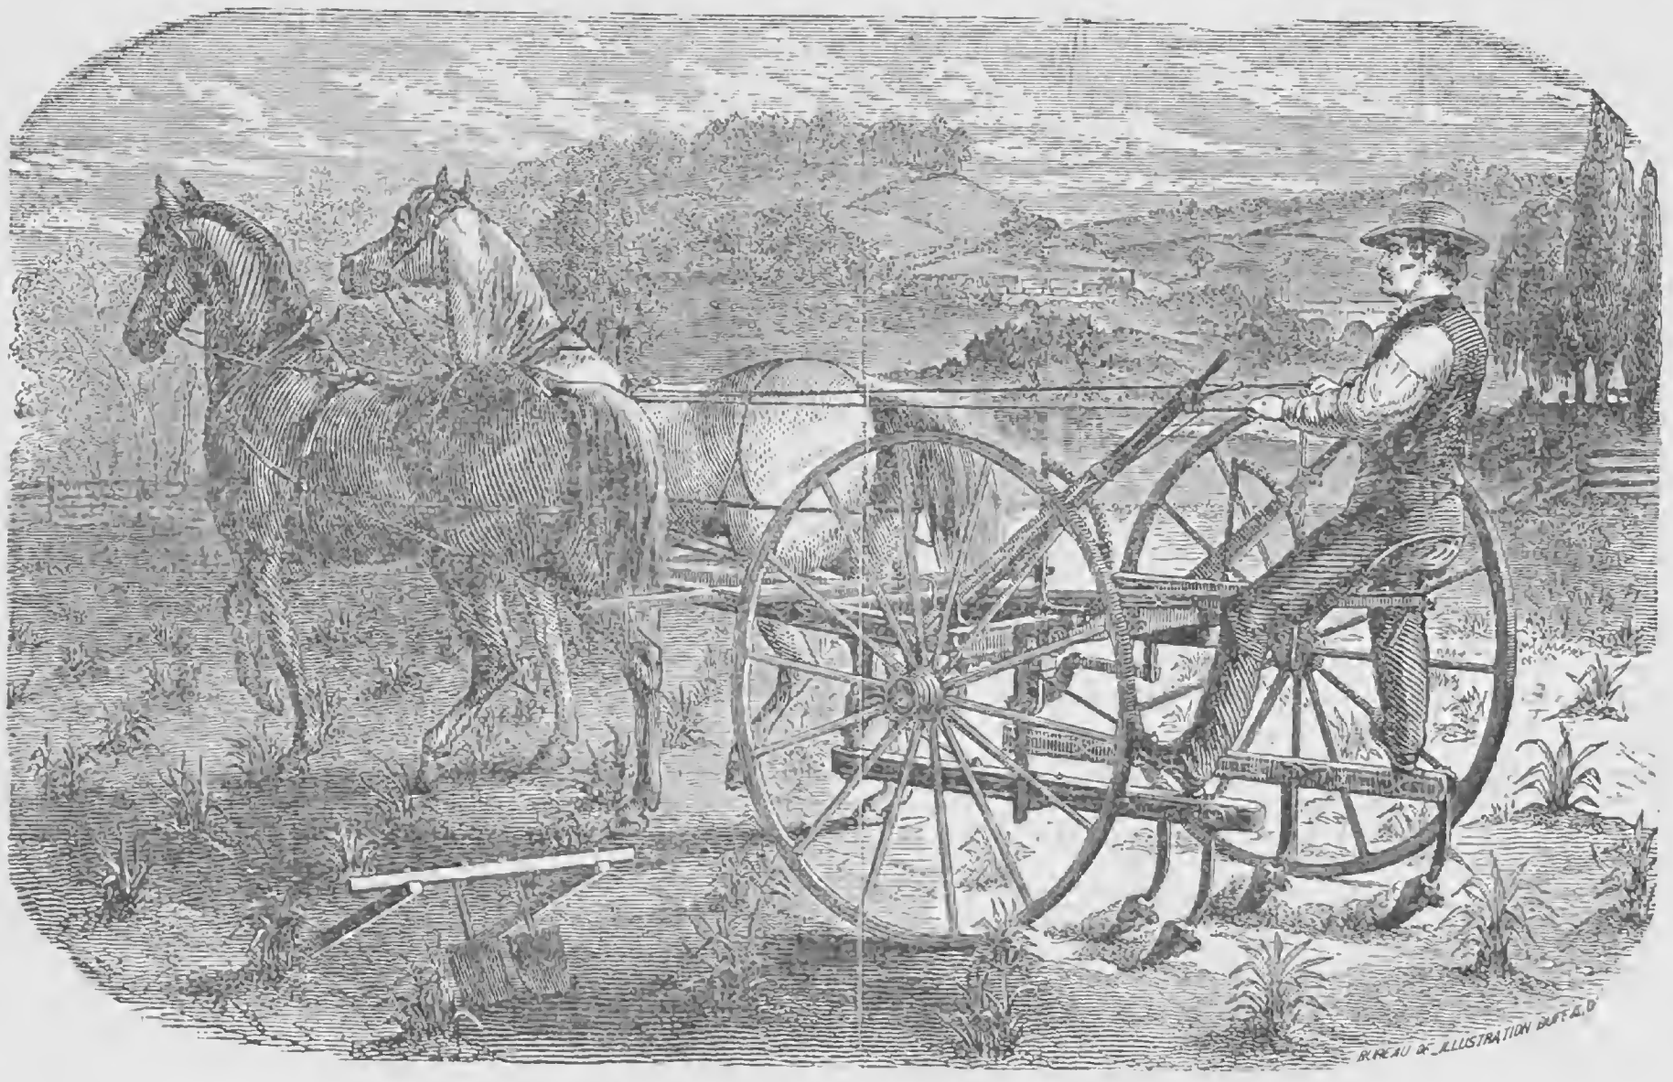
The construction of the machine secures strength and lightness both of the working parts and draft. The drag bars, or beams, to which the shovels or teeth are attached, are connected with the main frame by wrought-iron hangers and a substantial self-adjusting device which admits both of a lateral and vertical movement of the beams. These always move in a horizontal plane when moved from right to left or *vice versa* while the machine is at work. They are under the easy control of the driver, enabling him to dodge hills that are out of line and avoid plowing them up. The beams are so well balanced that they are easily managed by the feet without weariness to the legs. They are raised and lowered by long, easy-working levers which are within a few inches of the operator's hands. Each side can be raised or lowered or held in any desired position without in the least affecting the working of the other side, a feature that all corn raisers understand, where there are dead furrows or uneven surfaces to cultivate.

The shape and pitch of the shovels, the length of the beams and their connection with the main frame at a sufficient distance from the shovels, all tend to make the plowing deep. Its depth, however, is under the control of the driver by means of the raising levers.

A further adjustment to regulate the depth of plowing is afforded by the standards to which the shovels are attached, which can be instantly raised or lowered on the beams. The shovels can also be veered to throw the dirt to or from the corn, or moved nearer or further apart.

Farmers who have used sulky cultivators testify that they are most economical and profitable machines to have on the farm. By their use the farmer can raise better corn, because his fields are better and more thoroughly cultivated; he can raise more of it, because his ground is cultiva'ed deeper and hills out of line are not plowed up, and because shiftless or careless field hands cannot prevent this machine from doing good and thorough work, and by cultivating more rapidly he can give his corn more attention and go over it oftener than without the machine. A pair of shields are furnished with this machine, each of which works independently of the other and with the drag bar to which it is attached. They are held to the drag bar by a neat patented device, which allows them to be adjusted to suit the work to be done and to be instantly detached or put into position. This device effectually prevents the covering up of the small and young plants when cultivating. Moreover, the owner of such a machine can raise corn cheaper because it is so simple and so easily handled that a boy old enough to drive a team can plow corn all day with it and be fresh and able to do the chores at night, thus doing in one day what a man would take two days to do under the old method.

The machine is also specially adapted for preparing ground for seeding, or for cultivating in seed sown broadcast. For this purpose an additional shovel is furnished, and when the cultivator is used with five shovels in seeding, the ground is left almost, if not quite, as smooth as when harrowed. It is also excellently adapted for marking out corn rows. For this work the cultivator is used with four shovels; one row is marked at a time, and the furrow receives the same outside plow on returning, the rows are kept of uniform width, and with the four plows the ground under and next to the seed is still better pulverized. For the cultivation of cotton a pair of sweeps are furnished with each machine, all ready for work, and which can be attached to the machine very easily, each sweep having a standard of the same size as the shovel standard, and which fits into the casting on the beam. The sweeps take the place of the rear shovels. The machine has also been used with considerable success in the cultivation of tobacco and potatoes. K.



RIDING CORN CULTIVATOR.—FIG. 248.

Miscellaneous.

BOOKS, CATALOGUES, ETC.

LANDRETH'S RURAL REGISTER AND ALMANAC for 1881—67 pages, illustrated. Sent gratuitously to all who apply to D. Landreth & Sons, Philadelphia, Pa. The frontispiece presents a bird's-eye view of their home seed-farm, 500 acres in extent. This is but one of four farms worked by this firm, and not, in area, the largest. The Register is full of practical and valuable information.

SORGO HAND BOOK. A treatise on Chinese and African Sugar Canes, varieties, culture and manufacture. By the Blymer Manufacturing Co., Cincinnati, O. Sent without charge to our subscribers who apply to the above firm.

What Others Say.

DR. FENNER says that it is easy to show by facts and figures that as much imitation butter may be made from the offal fats of the beef alone, in the United States, as will exceed all the present dairy product, by three or four times. Besides, it may be, and is, made from the fat of the swine, or lard, which places its possibilities almost beyond computation. It can be produced at a profit for nine cents per pound and ought to be retailed on the market for ten to fifteen cents per pound to those, if any, who wish to eat it.

GREEN OATS FOR FODDER.—Mr. W. A. Armstrong offers his testimony to the excellence of the fodder made from oats cut when green. He has fed many crops cut when the grain was nearly full, a period indicated to the eye by the gray appearance of the field. At this stage there is almost completed growth, but the ripening process has not begun, the sap is in the stalks and the heads almost formed. After wilting in the swath a few hours in good weather—a longer time in poor weather for curing—the oats are bound in sheaves of moderate size and at once set up, two-by-two, in shocks where they are left until dry enough to draw in, the degree of curing being dependent somewhat on the conditions of storage. If the sheaves are to be put on scaffolds and not packed to a great depth, little care need be taken to secure thorough curing in the field. Now, as to value, oats so gathered, he thinks, are worth more for feeding milch cows than the best hay, if made a part of the daily supply. He has never fed exclusively on oats. Cows in milk, and doing well on good hay, will at once show increased yields, when given a suitable allowance of oats cut green and cured in the way here described, and they will eat all the straw as cleanly as they consume the best hay. The fodder is good also for horses, better than ripe oats for horses not steadily employed, for they keep the coat good, and digestion unimpaired.

LANDRETH'S Rural Register says that the Public School law passed in Austria in 1869, provides that "in every school a gymnastic ground, a garden for the teacher, according to the circumstances of the community, and a place for the purposes of agricultural experiment, be created." The school inspectors of each district are instructed "to see to it that in the country schools *school-gardens* shall be provided for agricultural instruction in all that relates to the soil, and that the teacher shall make himself skillful in such instruction." The general law declares, "Instruction in natural history is indispensable to suitably-established school-gardens. *The teachers must therefore be in a condition to conduct them.*" Contrast this thoughtful care with the system, or rather want of system, for the finer instruction of the mind pursued in the public schools of our rural districts!

THE Farmer, of England, speaking of a patent egg box, says that the idea is to fit boxes, trays, and such like articles, with spring holders which will hold the eggs securely, notwithstanding variations in size, at the same time preventing injury from ordinary shaking and concussion. Several forms of the holder in question are claimed, some being for retaining the egg in an upright position, and others with the ends parallel to the bottom of the box. For cheapness and simplicity, however, nothing will beat the card-board trays now coming into general use.

THE Germantown Telegraph says that the French preserve eggs by greasing the surface with a mixture composed of four ounces of beeswax and eight ounces of warm olive oil.

IT is somewhat surprising, remarks Coleman's Rural World, that up to this time there have been no fruit or vegetable canning establishments in the West or South. The West affords such a good field for the consumption of such goods, and also offers the supplies in abundance and in great variety—every advantage, in fact, that the management of such enterprises could desire.

MR. REYNOLDS says about two-thirds of all our sugars imported from abroad is beet sugar, but to manufacture this successfully there have to be from five to ten thousand acres of beets raised to furnish a single factory and a capital stock of over a million dollars, and as yet the beet sugar industry has not been a success in this country, but the Amber Cane and corn-stalk sugar manufactory has been a grand success.

THE World's Fair project is apparently on its death-bed. We quote from the N. Y. Times. Half a dozen estimable gentlemen still insist that the fair ought to be held, but they cannot get other people to sympathize with them.

THE Centennial Exhibition was all very well, for the public understood that it was in some sense a patriotic celebration, and that it would not be repeated for another hundred years. It was endured with great fortitude and resignation by the people of the United States without distinction of party. The newspapers wrote of it daily for at least a year, and in spite of the awful weariness with which so chronic a topic was necessarily approached, no candid man can deny that the press habitually spoke of it with a noble assumption of cheerfulness. Even Philadelphia itself was uniformly patted on the back, and characterized as a deserving town which displayed a degree of enterprise that only large and important cities had hitherto shown. People came from all parts of the country to Philadelphia, and carried home with them the germs of malarial fever and a profound admiration for the abilities and wealth of Philadelphia hackmen. Many of them went so far as to say that they enjoyed the Exhibition, and were quite willing that their creditors and personal enemies should attend the next one. After such a display of magnanimity and unselfishness it is a little too much to ask people to undergo another exhibition, even if it is to be held in New York. A sense of duty to one's country may induce a man to join a suffocating crowd in order to gaze on the Corliss engine and the latest patent churn, or to buy preposterous boxes from alleged Japanese, and to eat atrociously bad dinners in a Polynesian pavilion; but having done these things once in his lifetime, the good citizen should be formally declared to be exempt from all further World's Fairs.

ALL the exhibitors who received certificates that their particular articles were the best in the exhibition have since occupied themselves in quarreling with one another, while three exhibitors who failed to receive first-class certificates were naturally very angry.

To hold a World's Fair to enable foreigners who do not want to buy our manufactures to exhibit goods that our tariff will not permit them to sell here, is to spend time and money to no good purpose. Such an exhibition may be an entertaining "show," but it would be much more honest to borrow a name from Barnum, and call it "the Greatest Show on Earth," than it is to call it a World's Fair.

BUT let us not trouble ourselves. We may have the cholera, and there is no doubt that we are in danger of an epidemic of typhus fever, but the danger of a World's Fair has very nearly passed away. Our people—according to the disappointed advocates of the scheme—are so disgustingly prosperous that they do not see any reason for dropping their present dollars in order to clutch at the possible prosperity that a World's Fair might bring them. The Executive Committee will probably hold a few more meetings to bewail the apathy of the people, and will then officially declare that the World's Fair is dead and buried.

EIGHT out of every ten hotels and restaurants in London supply their guests with artificial butters. So says the London Farmer.

. . . . . Col. Colman says that some

of the finest sirup that he has ever tasted made by farmers, was raised on their sandy soil, and some of it soil that would not raise corn. . . . . Mr. Schwarz, it appears according to the same authority, has been raising cane upon the same field for eight or ten successive years, and every year he has obtained a better quality of sirup and about as much cane, if not more, per acre. He is very careful to keep his ground as clear of weeds as possible. . . . . The first accurate analysis of a vegetable was not made till the year 1810, and so late as 1838 the Gottingen Academy offered a prize for a satisfactory solution of the question whether the ingredients of the ashes are essential to vegetable growth. . . . . The N. Y. Herald makes the too-sweeping assertion that Guinea fowls will keep all bugs and insects of every description off garden-vines; that they will not scratch like other fowls or harm the most delicate plants. . . . . An exchange publishes an article headed "How to Tell a Mad Dog." We have nothing to tell a mad dog that we cannot communicate by telephone or postal card.—Boston Transcript. . . . . "Pa, what is ensilage!" "Why—h'm—ensilage, my son, is ur-ensilage is—oh, something like mucilage, my son; something like mucilage; used to stick things together, you know. There now, run away to your play, and don't distrub me now.—"Boston Transcript. . . . . Whenever, says the editor of the New England Farmer, we look over another's farm that shows in any way superior management, we always want to get out our note book and sit down and quiz him—"interview" is the American word. . . . . The Prairie Farmer thinks from present indications the yield of wheat will be at least one-fourth less than the Winter wheat crop of last year.

ATTENTION is called to the advertisement of Geo. E. Pomeroy, Toledo, Ohio. An opportunity is here offered for any one desirous of obtaining a good farm on easy terms.

Everywhere.

RURAL SPECIAL REPORTS.

ARK., Poteau, Scott Co., April 27.—Fruit is about all killed here. Peaches *all* killed; apples about half. This has been the latest and coldest Spring for years. H. C. B.

GA., Washington, Wilkes Co., April 27.—In reply to an inquiry made by J. B. K., of West Paullet, Vt., in a late RURAL, as to the adaptability of Northern and Eastern Georgia for general farming, that is, for producing oats, corn, potatoes, butter, cheese, etc., you say Georgia is certainly not a first-class place either for dairying or raising Irish potatoes. I live in the eastern part of the State, and think I can give your correspondent a correct statement of some of the productions of this section. Oats are raised by some farmers as the main feed crop; 60 bushels per acre can be made easily. Corn is grown successfully both on uplands and lowlands; as much as 120 bushels per acre have been gathered from bottoms in this county. Irish potatoes are not raised for market, but I believe no place in the United States will produce larger crops per acre, and two crops every year at that. Dairying, as a business, is not followed by any of our people; but why cannot butter and cheese be made where clover, lucerne, all grasses, cow-peas, sweet potatoes, corn, oats, wheat, barley, turnips, beets, carrots, and, last but not least, cotton, can be raised in abundance? Cotton is mentioned in this connection, because I have found nothing better to produce large quantities of rich milk and butter than cotton-seed and cow-peas mixed. The farmers are behindhand here in getting in their corn and cotton on account of bad weather. The oat crop is looking splendid, acreage large; wheat is backward, little sown; barley is in full head, tall and luxuriant; strawberries and other garden crops will be abundant from present appearances. J. C. D.

ILL., Pana, Christian Co., April 30.—About February 25, I wrote you that the prospect for the wheat crop was good. So it was at that time, but at this date I must say the outlook for the Winter wheat crop is bad. During the latter part of March and the fore part of April it was nearly ruined. On the prairie there are not more than 15 acres of wheat out of every 100 acres sown last Fall. In the timber it is a little better, and there it will be about 33 per cent. of a full crop. I think apples, cherries, raspberries and pears are not injured. Cherries are blooming. Some think the grapes are injured somewhat. The weather is fine. Oats are sown and plowing and planting corn are under way. Grass is coming on finely. Some are turning out their stock after five months of steady Winter. D. B. P.

ILL., Godfrey, Madison Co., April 25.—The prospects are good for a fair crop of strawberries, raspberries and blackberries. A great many of the strawberry plants in old plantations, however, were killed by the crown borer in the Fall of last year. The Wilson and Kerr's Prolific seem to be particularly subject to its ravages. W. J.

KAN., Parsons, Labette Co., April 25.—Weather for two weeks unpreecedentedly fine. The pole and the equator have embraced; heat and moisture in abundance. Corn planting two-thirds done, and much corn up and looking well. Wheat splendid, but chinch bugs thick. Grass enough for stock. Latter very scarce and high. Apples going out of bloom. J. D.

KAN., Roxbury, McPherson Co., April 23.—We have had a very late Spring—three or four weeks later than usual. All farming Spring operations have, therefore, been kept back. No corn has yet been planted and very little plowing has been done for it. Fall-sown wheat has been badly hurt by the alternate freezings and thawings in March, but the weather is very favorable now—cool and wet with no frost. Peaches were killed except in well protected situations. The outlook for small fruits is very promising. L. C. M.

KAN., Salina, Saline Co., April 23.—We are having nice warm showers and everything is growing finely. The prospect for wheat is excellent; I have lived here 12 years and never saw it look better. Peach buds were nearly all killed; but in favorable localities a few are still uninjured. A. G. W.

MICH., Athens, Calhoun Co., April 25.—After a long and tedious Winter, Spring has finally come again. Fully two-thirds of the wheat are killed, so the prospect for a good harvest has failed; but if the weather is favorable we may get enough to live on. A great many farmers are talking of re-plowing and putting in Summer crops, and others have locked their granaries and intend to keep the wheat they have. Peaches are all killed in our section here, and most, if not all, the cherries and raspberries. There is a fair prospect for pears and apples. R. D. R.

MICH., Martin, Allegan Co., April 25.—The past Winter was the coldest and this Spring is the most backward I have seen in 20 years. Wheat has been very badly winter-killed. Wheat is worth $1 per bushel; corn, 50c; oats, 40c; hay, $12 per ton. R. J.

MICH., Schoolcraft, Kalamazoo Co., April 23.—Winter wheat is very badly killed in this county. Some of it is being plowed up; it looks now as if there would not be half a crop. G. H. T.

MINN., Winnebago City, Faribault Co., April 25.—The long Winter terminated quite suddenly to-day, when the mercury at 2 P. M. marked 83 deg. in the shade. Less than a week ago the snow lay over the land several feet deep in many places. The fields are settling and drying fast. I think wheat sowing will commence in earnest about Tuesday the 26th inst. Although wheat is the principal crop hereabouts, oats, barley, corn and potatoes give good returns. Sorghum sufficient for home use is raised by nearly every farmer, and the yield is about 200 gallons per acre, with good cultivation. We have cause to be thankful, as we have had no suffering greater than cold feet during the long, severe Winter just ended, and no floods to seriously damage property. The Blue Earth River, which flows north through this town emptying itself into the Minnesota 18 miles north of here, is full to overflowing, but is passing rapidly on its course carrying off the surface water made by the melting snows fast enough to prevent alarm. Our stock wintered well. Work horses are "spoiling" for work; nearly every farmer hereabouts keeps from four to ten horses. Hay and coarse grain are plentiful. Seed corn scarce; in fact, there is none at all. Not one in ten that depends, as heretofore, on crib corn will find any that will grow. I picked mine early and hung it up in a dry place, but all failed to grow except that which I hung in the Summer kitchen near the stove. This is a fine corn-raising country. Farmers plant enough annually for feeding purposes for all their stock, horses and hogs; it yields well—40 to 50 bushels per acre. Price of produce and stock: wheat, No. 1, 85 c.; barley, No. 2, 65c.; oats, 20c.; corn, 30c.; potatoes, 50c.; butter, 15c.; yearling steers, $15; milch cows, $25; work horses from $100@125; hay, per ton $5; fat hogs, per cwt., $4.50; improved farms of 160 acres, $3,000; raw prairie, per acre, $10; oak wood, per cord, $3; bass wood, $2.75. H. P. S.

MO., Richmond, Ray Co., April 23.—We have a fine county here for raising corn. Many ears measure from eight to ten and even eleven inches in circumference, and I have shelled off of one ear nearly one quart of grain. I claim that the larger the ears grown the greater will be the yield. T. N. C.

NEBRASKA, Plum Valley, Knox Co., April 20th.—I have just come to this State, but people who have lived here 15 or 20 years think the past Winter the hardest they remember. Snow commenced to fall last October and, remaining on the ground ever since is four inches deep now, and lots of old snow drifts are from five to ten feet deep. Farming and stock raising are the general industries here. A great many cattle have died; some estimate the loss in the State at half of all the cattle in it—cause poor feed and poorer care. Very few have what can, even by courtesy, be called barns. Usually crotched sticks are stuck in the ground and poles laid in the crotches and straw piled on them for a cattle shelter. Some dig a hole in the side of the bluff, put poles across the top, then pile on some straw and the cattle shed is completed. I ask how many cattle would live through the Winter in York State in such a place. But here stock so sheltered are well off, for many have no shelter, and no food but what they can pick on the prairie—I think this sort of stock-keeping cruel. Wheat is worth 75c; corn, 40c. on the cob; potatoes, 50c; cows, $25 to $40; oxen, $100 to $120, a pair; horses, $100 to $125 per head, ponies, $15 to $50 per head; hogs, live, $4; dressed, $5.50; bacon, 10c. This part of the State has been only eight years settled. We are 20 miles from the Missouri River. J. P.

N. Y., Clyde, Wayne Co., April 26.—A few light showers greeted us to-day, the first rain this Spring. We had numerous snow storms up to the 13th, and freezing nights till the 18th; at present we have very hot weather. Plowing began on the 9th, and a general commencement was made on the 14th. Sowing began the 18th; all of this first sowing which was rolled is now up. Wheat appears desperately poor. Too thin seeding, sowing a trifle late and poor preparation of the ground for sowing last Fall, ill prepared it for Winter the latter part of which was extremely severe, while the wheat was entirely unprotected by snow. In driving through the country one cannot, on an average, see more than one good piece to five miles. Or one may stand on the highest hill-top and yet not see a single entirely even green slope or flat. Still, nearly all those pieces which were put in with great care, well fertilized and sown early, are beautiful to look at now, except on steep hill-sides. In such places the wheat is thick and even and stands nearly six inches high. The buds of peach trees are quite large, and on opening, one can see the stamens, etc., of the as-yet-uninjured flower. The wild flowers, Blood-root (Sanguinaria Canadensis), Adder's Tongue (Erythronium Americanum), Squirrel Corn (Dicentra Canadensis, and the Dutchman's Breeches (D. Cucullaria), were in bloom a week ago. The Japan Quince (Pyrus Japonica) is just in blossom. Not as many apple trees were planted as in former Springs. In pruning fruit trees, some time ago, I found the common pocket pruning knife an excellent tool for sprouting old apple trees, being far handier and quicker than a saw. W. X.

N. Y., Rockwell's Mills, Chenango Co., April 29.—The first thunder storm of the season came to the Unadilla Valley on April 26. It found the roads thick with dust while snow could be seen on the northern slopes of the hills. A hasty change of toilet during the shower brought out the russet fields in robes of emerald. Farmers have generally sowed their oat fields. The creamery is in full blast with 600 cows. A private dairy is becoming exceedingly rare in this section of Chenango County. Two or three skilled workmen do the work of 20 or 30 and do it much better, as the facilities are much better. E. J. B.

N. Y., Ithaca, Tompkins Co., April 25.—A cold, raw wind blowing from the northwest for almost a month has been very hard on the wheat. The difference where good culture and plenty of fertilizers have been applied is plainly seen. The prospect for wheat is not nearly so good in this locality as it was last year. Yesterday and to-day extremely warm; thermometer at 80°. Indications of rain which is needed very much, especially to start the grass. Prospect for fruit good. I. P. R.

N. C., Lynn, Polk Co., April 21.—We shall have plenty of fruit of all kinds. Spring is here and the woods look like one vast flower garden. D. E. M'A.

OHIO, Mount Eaton, Wayne Co., April 27.—We are having a very late Spring, and farmers are behind time with their work, as no oats have been sown yet, nor will any be for a few days. About the 1st of April snow fell on the level about two feet, and lay on the ground for about ten days. It has only been a day or two since there was any plowing done and the ground is wet enough yet. Wheat looks well in general, and I think, if no mishap occurs to it yet, we shall have a full crop. Fultz is mostly grown in this part. It averages from 25 to 40 bushels per acre, according to conditions and quality of soil. Our large farmers do their own harvesting almost entirely with the use of self-binders. The thrashing is done by steam rigs which thrash from 500 to 1,000 bushels per day. Horse-power thrashing is a thing of the past in this section. Land is worth $75 to $125 per acre, according to improvements. Wheat, $1.06; corn, 48c. to 50c.; oats, 37c.; hay, from $12 to $15 per ton and scarce at that; butter, 18c.; eggs, 12c. The thermometer indicates 87°. W. H. P.

OHIO, Mt. Vernon, Knox Co., May 2.—We have had a very cold and snowy Winter. It has killed all the blackberries and raspberries so far as I can learn, but strawberries promise well. Peaches have a fine prospect for a good crop. I cannot see why they were not killed. Potatoes are very high-priced—$1 per bushel; corn, 50 cents; wheat, $1; oats, 40 cents; onions, $2. M. W.

PA., Northumberland, Northumberland Co., April 29.—Spring has come to stay, though fully two weeks late. Farmers are putting forth their best energies. The usual area of oats and corn will not be sown, on account of the lateness of the season. All kinds of stock look bad this Spring, and a bad distemper has broken out among the horses. About the usual quantity of tobacco will be grown this year, though very few sales have yet been made of last year's crop. Winter wheat—no Spring wheat is raised here—is looking well, especially along the rivers. Wheat, $1: corn, 50c.; oats, 40c. No barley is raised here. Butter, 25c.; eggs, 14c. We have no creameries here, but we have a life insurance company which is just as bad (Oh!). This has been the best season for rafting for a number of years, some 2,000 rafts have passed down the West Branch of the Susquehanna to market. R. C. M'W.

S. C., Greenville, Greenville Co., April 23.—The past has been the severest Winter I have ever seen. Did you know the California Poppy is an evergreen? [Not here.—EDS.] It makes a nice border alongside walks. Euonymus plants have been generally killed here, except the small ones. I am expecting a great many plants and 500 Chinese Arbor-vitæ from Saul, the Washington nurseryman. The Arbor-vitæs are intended for a hedge; others of the same sort have endured the Winter well here. I get a great many seeds from Vick, who is always reliable, and a great many from Berckmans, of Augusta, Ga., who is as honest a man as one can find. B. F. P.

TEXAS, Seclusion, Lavaca Co., April 25.—Spring has been very dry and late, but we had a very heavy rain this week which was very unfavorable to the crops just planted. Some think of planting over again. C. D. P.

WISCONSIN, Spafford, La Fayette Co.—The Winter here has been long and tedious. Very little Winter wheat is sown in this vicinity, but what there is has come out very well. Farmers have just commenced work this week. Spring work is fully three weeks later than usual. W. S.

WIS., Madison, Dane Co., April 18.—We have a late Spring for this locality. No Spring work done yet. Large snow drifts are still hard about the fences and considerable frost is still in the ground. Just now the weather is favorable. W. B.

The Querist.

ANSWERS TO CORRESPONDENTS.

Mange in a Horse.

H. A. M., Marion, N. Y., asks for a remedy for mange in his horse.

ANS.—Mange in the horse, as in all other animals, is due to the irritation and ulceration caused by the burrowing of minute insects. The disease is contagious, only requiring for its development the passage of the mites or their eggs from infected to healthy animals. This transfer may take place by the sound animal coming in contact either with an ailing one of the same sort, or with some object on which the mites or their eggs have found a resting place. Moreover, any animal may accidentally be the carrier of this little pest from infected to clean subjects. Various causes predispose animals to afford development to the mange parasites and to aggravate their ravages, such as neglect, dirt, starvation, ill usage, etc., and in curing the ailment these should be remedied. The disease, in horses, usually first shows itself on the side of the neck just at the edges of the mane, and on the insides of the quarters near the root of the tail. Thence it spreads along the back and down the sides. The first symptom is an excessive itching, causing the horse to rub himself eagerly against any obstacle. The skin becomes scabby, the hair falls off in patches, leaving the skin at first smooth with a few small, red patches, each of which contains one of the parasites, technically known as acari. In time the pimples multiply, harden into scabs, under which the acari may be found like mites in cheese. The constant irritation soon makes the infected horse feverish, thin and wretched.

TREATMENT—The only way to rid any animal of the mange is to kill the mites and their eggs. This can be done only by the application of a remedy to the parts affected; for although internal treatment is often beneficial, the mites must be killed by external local applications. Just like the itch-mites on the human subject, the mange mites on a horse can be certainly destroyed by sulphur, turpentine, arsenic, hellebore, and corrosive sublimate; but inasmuch as some of these are almost as dangerous to the horse as to the parasites, milder remedies are preferable. As a first measure the infected animal should be as thoroughly as possible cleaned of scab and dirt with a wisp of hay and the light, gentle use of the curry-comb. Then prepare one of

the following recipes, the first for a mild case, the second for a severe one: First, common sulphur, six ounces; sperm or train oil, one pint; spirits of turpentine, three ounces. Mix and rub well into the skin with a flannel, or, in preference, with a painter's brush. Second, compound sulphur ointment, eight ounces; train or sperm oil, one pint; spirits of turpentine, three ounces. Mix and use in the same way as the other. Whichever of these dressings is used should be well rubbed in every third day for a couple of weeks in trifling cases, and for three or four weeks in severe ones. Another effective recipe is the following: Animal glycerine, one quart; creosote, one gill; turpentine, one pint; oil of juniper, one gill. Mix well together and shake, and saturate the whole skin with it as nearly as possible, rubbing it thoroughly in with a soft cloth. After leaving it for two days, wash the animal with warm water and soft soap; rub him until dry; after which rub him again all over with the same dressing; and repeat the operations until a cure is effected. Usually three or four applications will be sufficient. All the stable fittings and all objects with which the infested animal came in contact, and against which he or others may come in contact afterwards, should be thoroughly washed with a solution of corrosive sublimate, made in the following proportion: corrosive sublimate, one ounce; methylated spirits of wine, six ounces; water, one gallon. Dissolve the sublimate in the spirit by rubbing in a mortar, then mix with the water and use with a brush, stirring it up constantly to prevent settling. Of course the druggist will "fix" the above recipes. Infested clothing should be destroyed as it is nearly impossible to cleanse it thoroughly. If the use of it is risked, it should be thoroughly washed, and when dry saturated with spirits of turpentine.

Arresting Fermentation in Cider.

W. T. B., Madalin, N. Y., asks for some method of clarifying cider by which the impurities held in solution in it may be removed. He has been told that "fish glue" is sometimes used for the purpose and he asks where can it be obtained and how should it be used.

ANS.—Our correspondent should have stated the present condition of the cider. When cider has advanced far into acetous fermentation it is not worth while to attempt its purification. There are various applications recommended to counteract fermentation. The "fish glue" mentioned is isinglass, which can be found at any druggist's. Isinglass and brimstone (one ounce of the former and two of the latter for 30 gallons), after being reduced fine in a mortar, are stirred into the fermenting cider. Sulphite of lime, or, preferred by some, sulphite of potash, is also applied to arrest fermentation. Sulphur has a strong influence in arresting fermentation in all bodies, but if too much is used in cider it affects the taste somewhat disagreeably. Sulphur is also applied in the form of sulphurous acid gas, in the following manner:—Put two gallons of the fermenting cider into a purified empty cask, then introduce through the bung hole, a lighted sulphur match by means of a piece of wire not so long as to reach the fluid. The match is made of thick linen dipped into melted brimstone. The linen is wetted at the end attached to the wire, and when the brimstone is consumed in the barrel, the wire is withdrawn, the bung closed and the barrel rolled to and fro for some time to cause the absorption of the sulphurous gas by the cider. The barrel is then filled with the cider, and is to remain quiet till the subsidence of the ferment effected by the sulphurous gas. But it sometimes requires several repetitions, according to the degree of acidity. This was the plan used thirty years ago. But if the writer were to try the renovation of too-much-fermented cider he would filter the cider first through rectifiers, wood charcoal, excluding the air as much as possible, and then apply one ounce of salicylic acid to 30 gallons. The filtering would reduce the ferment and purify the cider, and salicylic acid would prevent further fermentation. This acid is dry and very light. Should be completely mixed in the cider before putting in barrels. In putting up cider in the Fall, after filtering out all pomace, if about six pounds of fine charcoal are put in each barrel and all stirred up, it will look like ink at first, but after it subsides it will be very clear and fermentation will be slow. It requires a good deal of practice to make the best cider.

Dropsy in a Horse.

J. C., Stewart Minn, asks the cause of, and a remedy for, dropsy in a horse.

ANS.—Several parts of the horse may be affected by dropsy—the heart, the brain, the chest, the scrotum, and the abdomen; but probably dropsy of the abdomen is referred to by our inquirer. This is generally due either to chronic inflammation of the peritoneum,—a tough, white, membrane that lines the abdomen and covers the bowels—or to injuries to it, both of which cause it to secrete a watery fluid, which fills the abdominal cavity and unless attended to causes death. It also sometimes arises from obstructed circulation caused by disease of the liver, lungs or heart, as well as from a poor, watery state of the blood, brought about by exhaustion or poor or scanty food. Whatever the cause, the chief symptoms are thirst and loss of appetite; hard, small pulse; paleness of the nasal membrane; a dry mouth; drooping head; general weakness and languor; loose, staring coat; tenderness and enlargement of abdomen; constipation, etc. Treatment when the disease has advanced far is powerless; but in the early stages the food should be small in bulk but highly nutritious in quality; no work should be imposed; the animal should be placed in a dry, well ventilated stall and, nights and mornings, given a tonic ball composed of an ounce of powdered digitalis and half an ounce of sulphate of iron. Mix with mucilage and a spoonful of linseed meal to form a ball. As it is important that the kidneys should be kept active, the following diuretic should be prepared: soap two pounds; nitrate of potash, two pounds; resin, three pounds; Venice turpentine, two pounds; oil of turpentine, half a pint. Melt the soap and resin slowly together, and stir in the other ingredients while the mixture is cooling. Make it into two-ounce balls with linseed meal, and give one at a time as often as necessary to keep up a free action of the kidneys. When water accumulates its presence can be ascertained by placing the ear against the abdomen at one side while somebody strikes the opposite side. When it has gathered in a large quantity, it should be drawn off by means of a fine trocar plunged into the lowest part of the distended abdomen.

Heating a Small Greenhouse with Sawdust.

C. P. B., Edwardsville, Ill., has a greenhouse 10x12 feet, heated by a brick flue. A friend, on inspecting it, said he had seen houses of that size—and larger ones, too,—in Europe, heated by sawdust, which was placed in a bin alongside the bench, and which, in heating, gave out heat enough for all purposes, the heat being increased when desirable by stirring up the sawdust, and we are asked what we think of this mode of operating a small greenhouse.

ANS.—The use of manure, leaves, sawdust, etc., is an old and very primitive method of heating small *sunken* greenhouses, pits, etc., but has been superseded by the far better methods of the brick flue and the hot-water pipes. The manure, leaves, etc., are still commonly used for pits, hot-beds, etc., both in Europe and in this country; but for a greenhouse or a hot-house there is no well-tried method nearly so good as hot-water pipes, and in the end they are the cheapest, besides being thoroughly reliable, quite free from danger, and cleanly and tidy, which the other methods are not. When plants, such as the pineapple, that require a moderate bottom heat, are grown in a hot-house, the pots are usually plunged in a bed of tan or sawdust, and this bed nearly always runs through the middle of the house, and is probably what your friend saw; but even here hot-water pipes are superseding sawdust and tan. In such houses, however, there are always pipes or flues in addition to the bed. In a climate like ours the sawdust plan is not to be thought of. If you wish to change your flue, take a step forward and use hot-water pipes. Sawdust would require a good deal of "stirring up" to heat your greenhouse, with the thermometer looking sharp toward zero. In a mild climate, where only a moderate heat was required, and labor very cheap, sawdust and manure would answer very well; but it is a dirty and laborious plan, full of vexation and toil.

Worms in Horses.

H. B. K., West Paulet, Vt., asks the symptoms of worms in horses and a remedy therefor.

ANS.—The general symptoms of intestinal worms in horses are, a rough, staring coat; loss of condition generally; an irregular but voracious appetite; fetid breath; passing of mucus with the dung; colicky pains; itching and pulling of the anus, etc. The horse will often lift its upper lip and rub it against any near-by object; while colts will often pick the hair from their bodies and limbs. The intestinal worms of horses are either tape-worms or pin-worms. When these are suspected, it is well to obtain positive proof of their presence by giving the animal an ordinary dose of physic or the following purge:—aloes, four drachms; powdered male fern, one ounce; oil of worm-seed, 20 drops, to be given in a pint of gruel an hour before feeding in the morning. If on examining the evacuations, one or more worms are noticed, give this vermifuge:—tartar emetic, one drachm; powdered ginger, one drachm. Mix with enough of linseed meal, wet with boiling water, to form a ball, and give one every morning for a week, before feeding; then give a pint of linseed oil. Let the stomach rest a week and then give another lot of balls, followed by the dose of linseed oil. Then give good diet with daily tonics, say, two drachms of sulphate of iron, or four drachms of gentian in the food. For tape-worms an ounce of areca nut, fasting, followed with four drachms of aloes, should be given if the horse is weak; if the animal is strong, however, a better dose would be an ounce of oil of turpentine in an ounce of water, to be followed in four hours by another dose, which in its turn, is to be followed in an hour by four drachms of aloes.

Miscellaneous.

A. M. C., Coe Ridge, Ohio, says that in jarring the curculio from plum trees, it is recommended to drive into the tree iron spikes to strike upon, and he asks how can these be driven into the limbs without splitting them. He has tried jarring with a padded mallet, but it bruises the bark badly.

ANS.—Messrs. Ellwanger and Barry tell us they never employ iron spikes for this purpose. In their practice they find it a very good plan to cut off a small branch leaving a stump to strike upon.

S. V. W., Jericho, L. I., asks how to treat the Night-blooming Cereus.

ANS.—There are several Night-blooming Cereus. C. grandiflorus is the type. The size of the flowers varies from five to fifteen inches in diameter. C. McDonaldii is said to be the largest. Most of them will not bloom until they have attained to some age. They begin to unfold their flowers early in the evening. They last but a few hours. A light, sandy soil is required. Water freely while in bloom and sparingly at all other times.

A. M. W., Rome, N. Y., has sent to us an apple for name. He has kept specimens for nearly two years.

ANS.—Unable to name the apple, we sent it for identification to Mr Charles Downing, who replies as follows:—"I am sorry to say that I don't recognize the apple as any variety I am acquainted with, and it is probably a local apple. It is pretty and of a smooth, regular form, and no doubt a long keeper; but the quality is not equal to that of many of the old varieties."

S. B. P., Ottonelly, Ohio, desires to know how many years it requires to have potatoes attain full size from seed.

ANS.—We start our plants from seed under glass and transplant to open ground about May 20. At the end of the first season the tubers average an inch in diameter. Eyes from these will grow to the full size in another season.

C. H. B., Steward, W. Va., sends us from his young orchard a couple of twigs on which there are small knots, and he asks what causes them, and whether it—whatever it may be—is likely to injure the trees.

ANS.—The distortion in the growth is due to an insect, as will appear from cutting into the enlargement. We should not in this case fear any serious injury.

J. B. D., Oakley, Ohio, asks who are the makers of a corn-husker he describes.

ANS.—Philips Spiral Corn Husker Co., Hudson, New York, are the manufacturers of the machine. The corn is fed to it from the shock and it husks, crushes the stalks and separates the ear from the husk. We have heard it spoken of highly and seen it in operation—it appears to do its work thoroughly.

D. D. McA., Lynn, N. C., wants to know if sawdust may with advantage be used as a mulch for strawberries and potatoes.

ANS.—Our answer would be in the negative. It makes a hard cover and an excellent harbor for many kinds of insects. Would our readers who have had experience please give their views.

G. C. L., Philadelphia, Pa., asks where can he get—and at what price—the Report of the New Jersey State Board of Agriculture.

ANS.—The Eighth Annual Report is just issued and can be obtained from the Secretary, P. T. Quinn, Newark, N. J.; price probably 25 cents.

A. L. J., Canada, wishes to know what would be our choice of gladioli were we confined to six.

ANS.—Mary Stuart, Shakespeare, Octavia, Addison, Eugene Scribe, Mad. Desportes.

Several Subscribers ask where can Persian Insect Powder be obtained.

ANS.—Any druggist or seedsman can either supply it from his stock or get it to order.

T. E. S., Burbank, Ohio, asks for a remedy for the currant worm.

ANS—Hellebore is a specific. Use dry or mix with water.

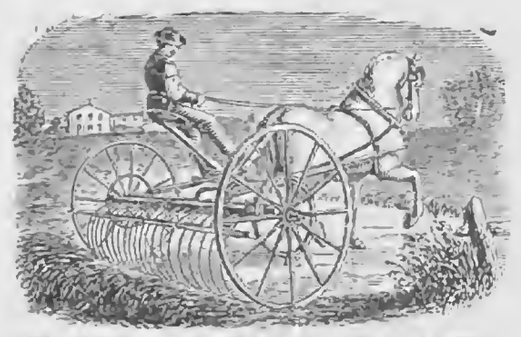
COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, MAY 7th.

W. W. J.—Mrs. S. A. M.—W. S.—M. M.—T. E. S.—F. S. (Ill.), thanks for potatoes.—J. C. D.—D. W. T.—G. E. N.—E. W. K., thanks for vines.—D. B. P.—J. A. B.—C. D. P.—W. H.—Mrs. T. C. B.—Miss L. F.—Constant Reader.—P. L. R. F.—L. P. N.—E. A. H.—C. D., thanks.—A. M. W.—E. W. K., thanks for vines and seeds.—L. G. S., thanks for corn.—W. F. C.—A. M. C.—J. E. S.—E. J. B.—J. G. B.—J. P. R.—C. J. R.—Invererity, thanks for seeds.—A. V. R.—Mrs. V. A. R.—C. H. D.—U.—W. C. McV., the oats we suppose to have come from you are sown. Thanks.—W. H. P.—D. S.—W. B. N.—G. A. G., Jr.—W. J.—W. H. L.—H. J. Wedell, Texas, request at once attended to—F. H. S.—F. E. H.—T. A. C.—R. T. J.—H. P. S., Los Angeles, Cal., thanks for seed.—M. W. F.—R. L.—S. J. P.—N. W. R.—Messrs. Hale, thanks for plants.

Implements and Machinery.

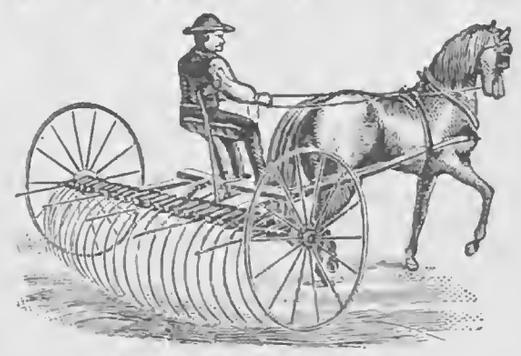
J. B. CROWELL & CO.,
Greencastle, Pa.
25th Year.

GRAIN & FERTILIZER DRILLS.
Complete Force Feed, Rubber Springs, AUTOMATIC CUT OFF, saving Fertilizers. Agents wanted in territory not occupied.
☞ Descriptive Circulars sent on application.



THE GREGG RAKE.
Can be Operated by the Foot Alone,
Leaving both hands free for driving. Can be operated as a complete Hand Dumping Rake, at the will of the driver. Can be operated easily by any Boy or Girl who can drive a horse. First-class in every particular. Strong and Durable. Best of Material. Well Finished. Thoroughly tested, never fails. Send for Circulars.
Address GREGG & CO., Sole Manufacturers,
Trumansburg, N. Y.
Also Manufacturers of Lawn Mowers, Plows, &c.

THE S. R. NYE IMPROVED
BAY STATE RAKE.



MANUFACTURED BY THE
BELCHER & TAYLOR
AGRICULTURAL TOOL COMPANY,
Chicopee Falls, Mass.
This Rake received the highest award at the Centennial Exposition and Field Trial. The only Silver Medal awarded at the Paris Universal Exposition, in 1878. It is easily handled by a girl or boy strong enough to drive a horse. Send for circulars.

THE TIMKEN SPRING BUGGY.

The only easy riding side bar buggy in the world. Rides easier than Elliptic End Spring or Side Spring Buggies, hangs low, easy of access, elegant in appearance, and very stylish.
We manufacture over **100 a week** of these celebrated open and top, one and two seated buggies, **first-class** in every respect, and with the best of mechanical facilities, machinery adapted especially for this one style of buggy, can furnish SUPERIOR GOODS at LOWER PRICES than small manufacturers or other large manufacturers who build a variety of work. Send for Catalogue and learn your nearest agent.
A. ABBOTT & CO., 300 Wabash Ave., Chicago.

500,000
PEOPLE IN THE UNITED STATES ARE USING THE CELEBRATED
STUDEBAKER WAGON,
AND ALL ARE HAPPY!
Send for Illustrated Price List, mentioning this paper, to
STUDEBAKER BROS. M'F'G CO.,
South Bend, Ind.

BUGGIES for Dealers' Medium Work; Low Prices. UNION CARRIAGE M'F'G CO., Cincinnati, O. Catalogue FREE.

THE VIBRATOR HARROW.

Best Harrow made. Cuts every inch of ground, & adapted to all kinds of soil. Peculiar shape of tooth makes it easy of draft and leaves the ground light and mellow. Relieves itself of all obstructions. Bundled very compact for shipment. 3 sizes cut 6, 8, and 10 ft. Agents wanted. Write for Circulars to
PHELPS & BIGELOW WIND MILL Co.,
Kalamazoo, Michigan.

THE
Rural New-Yorker,

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, MAY 14, 1881.

ALL OF OUR SUBSCRIBERS, WHO ARE ENTITLED TO IT, WHO HAVE NOT RECEIVED OUR PRESENT SEED DISTRIBUTION WILL KINDLY NOTIFY US AT ONCE BY POSTAL.

FARMERS or gardeners who were prevented from doing so before crops were planted will in many cases derive valuable information by sowing unleached ashes, nitrate of soda and superphosphate upon different plots of the same crop—be it oats, corn, grass or vegetables—as a top-dressing. Then two of the above fertilizers and, finally, all may be mixed together for other plots. The results may give a hint as to whether potash, phosphoric acid, ammonia—one, two or all—is most needed.

SENSUAL pleasures, outside of their legitimate use, are transitory, and leave a bitter, often a life-long, sting. They "die a-borning," but their carcasses offend and poison the life of him who has sought their perilous joys. Intellectual pleasure, the pleasure of acquiring and using knowledge, is pleasant and is cheap. The expansion of our thoughts, the working out of our plans are a constant spring of enjoyment which ought to be and may be always innocent, and within their scope, yield satisfying pleasures. But the cheapest of all pleasures are the pleasures of the soul. To see ourselves growing, by faithful effort, daily more honest, more useful, more generous, more kind,—these are the happinesses which last. More than that, they are the pleasures that pay as they go, that yield a compound interest which is never defaulted, and increase with the using. They are cheap enough for the poorest, satisfying enough for the most ardent, enduring enough for immortals.

OLEOMARGARINE.—It seems that it is impossible to distinguish by taste good oleomargarine from butter. Is it unreasonable to suppose that there will be improvements in its manufacture, and that ultimately—possibly in the no distant future—it will entirely take the place of butter from milk? Displeasing as the thought of such a possibility may be, no harm can arise from looking at the contingency squarely in the face. Greater changes have happened in other industries, and in the face of the bitterest opposition at the outset have finally been accepted as steps of legitimate and wholesome progress. We have opposed oleomargarine from the beginning, and, wisely or otherwise, cannot overcome an intense prejudice against the "stuff." All should insist that it be sold under its real name; that it stand upon its own bottom and rise or fall according to its own worth or worthlessness. If it is a healthful article of food and the people like it—there is nobody who can say them nay. But at present while it would appear that a great majority of the people of cities are eating oleomargarine there are few who would purchase or eat it knowingly.

FRAUDS IN THE MAIL SERVICE.

IRRESPECTIVE of all party bias the Postmaster-General is doing a creditable work in bringing to light long concealed frauds in the Star Route service. The Star Routes over which mails are carried by means other than the railways are contracted for by men at a certain price and they, in turn, contract with others who perform the actual service of conveying the mails from place to place. The way frauds are perpetrated by these contractors is somewhat as follows: Bids are advertised for a line with slow service and infrequent trips. These sharp contractors, who are in the ring, bid very low and the lowest bidder, of course, gets the contract. In a few months petitions are gotten up for more frequent trips and more rapid service, and the contractor then, without competition, on his own affidavit, renews the contract at about his own terms. In this way one Miner, contracted, at first, for a route of 310 miles, one trip a week, for $2,350. Two months later he was fortunately ordered to run three trips a week for which he received $32,650 more, and in August of the next year, six trips a week brought him $35,000 more.

In this way a route in Colorado, 31 miles long, was raised from $317 a year to $2,812; in Idaho, one 52 miles long from $720 to $3,360; one in Wyoming from $11,777 to $78,266, and one in Dakota, 250 miles long, was raised from $2,350 to $67,650 a year. The recent investigations show that there has been an addition of over $2,000,000 to the expenses of this one branch of the Government service without any explanation or apparent cause. A thoroughgoing reform is needed, and we hope that no guilty man will be allowed to escape.

PREPARING FOR OUR NEXT CORN CROP.

VARIOUS have been the surmises as to the special cause or causes of our great corn yield of last year. We would be very glad if it were possible to ascertain to what extent the commercial fertilizers used assisted in the production of that crop. We have now prepared a six-year-old grass field of about seven acres for corn. No manure of *any* kind has been spread or sown except upon one measured acre, 132x330 feet, and upon this we have sown 600 pounds of corn fertilizer, the analysis of which is as follows:

Ammonia	4.50 to 5.00 per cent.
Phosphoric acid	10.00 to 12.00 " "
Potash	6.00 to 7.00 " "

Now if this one acre should produce a decidedly heavier yield than the rest of the field, it would be reasonable to attribute the excess to the fertilizer, since the measured acre as to fertility seems to be a fair average of the field, in so far as it may be judged by the eye alone. We have no remembrance that this field has been manured since we have owned the Rural Farm, a period of fourteen years. The sod was plowed under in late March. It has been harrowed thoroughly, rolled once and again harrowed (east and west) and is now being marked out (north and south), so that the drills will be three feet and ten inches apart. The same method of cultivation in all respects as last year will be followed this.

Presuming that our agricultural contemporaries are more or less interested in agriculture, we must suppose that the reason why they have not alluded to our corn crop of last year was that they doubted the truth of the reports that were made. This year, should we again be favored with immense yields, we shall invite the proprietors of our esteemed contemporaries to come and see for themselves, so that they need not thereafter entertain scruples as to placing the facts before their readers.

WHEAT PROSPECTS.

THE conclusions with regard to the wheat crop, here briefly condensed, are the result of a careful comparison of the crop reports in our own columns with a much larger number that have appeared within the past week in various papers scattered throughout the country, supplemented by condensations of still later reports telegraphed yesterday from Chicago and other important points in the West. From all these sources we gather that fall-sown wheat has been much injured in Ohio, Illinois, Wisconsin and Iowa; yet even there the damage is somewhat less than was anticipated before the late mild spell had helped to invigorate feeble growth. Kansas will have an enormous wheat crop this year unless drought between now and harvest shall blast present hopes and indications. Winter wheat has there generally supplanted Spring sowing. Missouri also has almost abandoned Spring for Winter wheat, and the outlook there is highly promising. Reports of the Winter wheat in Michigan, however, are very discouraging. In the Middle States complaints of injury to the crop are considerably diminished, but it is hardly likely that the yield there will equal that of last year. On the whole, it is not unlikely that the increase in acreage under Winter wheat this year will go a good way towards making good the damage by winter-killing so far as regards the country east of the Rocky Mountains. In California the rainfall has been excessive and considerable injury has been done by floods in low-lying valleys, while the area under wheat this year is less than last, so that the aggregate yield is sure to be smaller. Owing to low prices the past season on account of inadequate ocean transportation, a large quantity of the crop of 1880 still remains in the State. In the Northwestern States—the chief spring-wheat region—the weather has been very favorable for seeding, which has been in progress for two or three weeks, most of it being now completed. Where the plant is already up it looks bright and thrifty. The ground is generally moist and in fine condition. In some of the bottom lands, however, floods have so thoroughly soaked the soil as to render wheat raising impossible. In Minnesota, Nebraska and Dakota, where Spring wheat is raised almost exclusively, the outlook is excellent and there is a large increase in the acreage. In Illinois, Wisconsin and Iowa reports of the Spring wheat are conflicting, ranging all the way from "very good" to "very poor." The acreage generally is much smaller than last year, as farmers have found that Fall sowing is better than Spring. There is a good deal of difference of opinion as to the area that will be planted, some maintaining it will be smaller than last year, while others think it will be greater. Probably it is too early yet to decide the matter. On the whole, the outlook in the Spring wheat regions of the Northwest is highly encouraging. It is by no means likely, however, that the aggregate wheat crop of 1881 will be larger than that of 1880, though it it is hardly probable it will fall much below it.

THE INTERNATIONAL MONETARY CONFERENCE.

REPRESENTATIVES from 15 nations, including Messrs. Evarts, Thurman and Howe from this country, are now in session at Paris with the primary object of securing an international agreement that silver shall be considered an unlimited legal tender, side by side with gold. To accomplish this object it would, of course, be necessary that all consenting nations should coin silver in unlimited quantity, and should fix upon some common ratio of value between gold and silver. The market value of the former here to-day is about 18½ times that of the latter, while the Bland Bill of 1878 makes the weight of the coined silver dollar 412 grains, or 16 times the weight of the gold dollar; and in France, Germany, Switzerland and nearly all other European countries the present ratio is 15½ of silver to one of gold. It will thus be seen that while the commercial ratio between the two metals is about 18½ of silver to one of gold, our government puts it at 16 to one and France and the other members of the Latin Union at 15½ to one, thus giving to silver a value considerably higher than its due.

Inasmuch as the annual production of silver and that of gold do not bear any fixed ratio, the relative market value of the two metals must, it seems to us, vary from year to year according to the greater or less production of either of the metals, despite any conventional standard agreed upon by any number of governments. As a matter of fact, during the 116 years between 1760 and 1876, according to the Report of the United States Monetary Conference, published a few years ago, the ratio of value between silver and gold changed 107 times, the extremes being 13.64 and 17.83 of the former to one of the latter. In that period the ratio of value remained the same for three years only once, and for two years only nine times. Yet it is proposed by the present Conference to fix it now internationally at 15½ to one until 1900—for 19 years! Less than three years ago a similar Conference, held at the same place, dispersed without accomplishing anything, and we greatly fear the issue of this will be equally abortive.

This unsatisfactory outcome is likely to be brought about, not only by the difficulty of deciding upon a fixed ratio of value, but also because France and the United States, by whose persistence the Conference was assembled, are the only countries deeply interested in securing the objects for which it has come together. France, having given a fictitious value to silver, has found that other countries in which it is cheaper have been paying her for her wares in that metal, while draining her of gold for the goods they have sold her. Accordingly while the Bank of France, in 1876 held, in round numbers, $300,000,000 in gold, and only $125,000,000 in silver, the proportion at present is abont $100,000,000 of the former, and $250,000,000 of the latter. What, then, can be more natural than that, being anxious to stop this excessive influx of silver and outflow of gold, she should endeavor to persuade other nations to adopt her ratio of value, use their silver at home and thus remove the cause of her trouble. The United States, being one of the greatest silver-producers in the world, is also naturally anxious to increase the market for it by inducing the whole of Europe to place no limits on its coinage. At present India is the chief market for the silver of the globe, that country, where it is the only legal tender, having taken two-thirds of the $1,800,000,000 produced between 1835 and 1875. Moreover, of the $84,000,000 minted here since the passage of the Bland Silver Bill in '78, two-thirds lie still in the Treasury owing to the impracticability of getting it into circulation, and it is thought that this could be more easily accomplished if other nations used silver freely.

BREVITIES.

IF *any* of our subscribers who are entitled to it have not received our present Plant and Seed Distribution, we must insist it is not our fault. *Every* application has been filled.

A TELEGRAM just received from W. I. Chamberlain, Secretary of the State Board of Agriculture of Ohio, says of the wheat crop in that State:—"Condensed reports from 1,000 township correspondents give the probable outcome of last year's wheat crop at 85 per cent. of a full crop. The probable total yield, with an average season till harvest, will be 45,000,000 bushels."

VANILLA OR SENECA GRASS blooms this year at the Rural Farm May 5. This is botanically Hierochloa borealis, the generic name, from two Greek words meaning sacred grass, it being usual in the North of Europe to strew it before places of worship on certain festival or saints' days. Its odor, which is between that of clover and vanilla, is powerful—a few panicles sufficing to perfume a room. It is said to be of little value for cultivation, for the reason that it has "powerful, creeping roots and very slight Spring foliage." It seems, however, to make very slow progress at the Rural Farm, though it has a congenial situation to spread over, viz., moist meadows.

WEEK before last the remark was made in our Agricultural News Department that out of 321 students at the Vermont University and Agricultural College, 132 were medical students, leaving only 78 to study classics and agriculture. We have since been informed, however, that not a single student in the University is now studying agriculture, and that there have been only two students in the agricultural department since its establishment sixteen years ago. The agricultural part of the University was started and has been kept up merely to obtain and retain the Congressional appropriation for a State Agricultural College. What would be the fit characterization for such a trick, according to the ordinary code of morality?

CORN YIELDS—A CORRECTION OF A "HEEDLESS STATEMENT."—We have just received the following note from Professor E. W. Stewart: "I was surprised at seeing, over the signature of Professor I. P. Roberts, on page 302 of the RURAL, that 'Professor E. W. Stewart states in an article on corn which appeared some time ago in the RURAL, that 100 bushels of corn per acre are an easily possible crop, and Professor Roberts properly speaks of such a statement as a great exaggeration, and that 'the science of agriculture can never progress rapidly in the face of such wild inaccuracy.' But attributing this to me is a greater 'inaccuracy' still, since I never made such a statement in the RURAL or in any other paper. I presume my friend did not intend to misrepresent me, and let us hope that he is more careful of his facts in instructing his classes. This statement is the more annoying to me, since within a year I have written a number of articles to show the harm done by such loose estimates of the corn crops, and especially with reference to 60 to 90 tons of green corn to the acre."

A COUPLE of weeks ago we expressed an opinion on this page that the provisions of the anti-oleomargarine bill introduced into the N. Y. Legislature were too severe to be passed or enforced. Since then the investigating committee, through Mr. Fenner, has wisely reduced by about one-half the license fees to be required from manufacturers and dealers of the product. Last week we expressed doubts, here also, of the existence of foot-and-mouth diseases among the American cattle landed at Birkenhead, England, and since then the cable informs us that the report was unfounded. Greater care in such matters is needed among either the trans-Atlantic veterinarians or newsgatherers. It is to be hoped, however, that the alarm the false report caused on this side of the water, will give rise to a stricter quarantine of all imported cattle so as to reduce to a minimum the danger of spreading the disease among our vast herds from any infected importation. Our remarks here last week with regard to the objectionable character of that project of the "Freedmen's Oklahoma Land Association," have been since emphasized by a telegram from Wichita, Kansas, dated last Tuesday, announcing that "Oklahoma" Payne had just received news there of the unfavorable result of his trial before the United States Court at Fort Smith, Arkansas, for having started a similar project. The Bill which created such a commotion before the Legislature of this State last week, giving $2,000 a year to the State Entomologist, was taken down from the shelf last Friday and passed. It is satisfactory to see that our State Solons are not so pacydermatous as to be insensible to a good pen-lashing. The dispute over the duty on "knit goods," we commented on here last week, has since been temporarily settled. The Supreme Court has granted leave to file a petition for a retrial of the suit on the decision in which the late ruling of the Treasury Department was based; and accordingly the Secretary has now revoked his order changing the rate of duty. This re-establishes the specific duty of 50 cents a pound on all "knit goods" in addition to 35 per cent. *ad valorem*; and as it must take a considerable time before a decision can be reached, the manufacturers need not just yet carry out their threat of packing off to Canada. Meanwhile there will be ample time for Congress to remove all doubt about the proper taxation by passing a law imposing the higher rate, thus "protecting" alike the manufacturers and raisers of wool.

Miscellaneous.

RURAL BRIEFLETS.

PROFESSOR TRACY, of Detroit, writes us that he has just examined his Winter wheat which was so placed that a part of each variety was protected and the remainder exposed and in unfavorable conditions. The result is that of the 15 varieties tried, the Mediterranean is the only one entirely uninjured. After it the Zimmerman (Tappahanock). Early May has suffered most, closely followed by Arnold, Gold Medal and Silver Chaff. Such results are very different from those obtained at the Rural Farm, which we shall place before our readers in due time.....

REFERRING to an inquiry about Bermuda Grass in the RURAL of April 16, Mr. Jones (of Binghampton), writes us that during a late visit to Texas he learned that this grass was highly esteemed there and a common method of cultivating it was to set out bits of the sod about four feet apart each way, and the first year to raise a crop of corn between these "seed" bits. The cultivation of the corn instead of disturbing the grass, is good for it, and the second season it spreads so rapidly that it mats the ground.....

IN Georgia the roots are cut into pieces two inches long, spread thickly upon the ground and then spaded under. Notwithstanding the hot suns, if mowed as we mow Northern lawns, it keeps green during Summer. As a forage plant, Mr. Berckmans, as we have already stated, deems it invaluable, ten tons per acre having been harvested upon land that would not produce 20 of corn per acre. It now appears that Bermuda Grass so dreaded in years past is now cultivated and considered a boon to the people of the South.....

SEE that the lawn-mowers are in order.....

THE mistake is often made by inexperienced hands of screwing the revolving blades too close upon the horizontal blade. A new lawn-mower, when properly set, should last two years upon an acre lawn, without resetting....

ONE of the showiest annual foliage plants, to our thinking, is the Purple-leaved Ricinus. The flower buds should be pinched out as soon as they appear. It is astonishing to what a hight the large-growing kinds of Ricinus will attain if planted in rich soil and all lateral shoots and flower buds be pinched out. We know of one plant thus treated that grew to the hight of over 20 feet.....

OUR friend, the Maine Farmer, makes the queer statement that Early Amber Cane "is only a variety of corn, and has most of the valuable characteristics of that valuable cereal." We thought that Early Amber was a variety of sorghum.....

"THE trouble with Quack," remarks the Elmira Husbandman, "is only in the pertinacity of its growth. Considered as a pasture grass it is entitled to high rank, so far as quality is concerned. Cattle eat it greedily, it starts early in Spring, and when closely grazed it is very quick to send up new growth with the first favorable condition; but its roots pervade the soil, and have almost unquenchable life, so that ground once occupied by them can be freed for other uses only at the expense of great labor and watchful care." The fields of the Rural Farm may be said to be filled with Quack Grass (Triticum repens). The fields in which we last year raised our Chester and Blount Corn were matted sods of Quack. We plow our sod ground, plant corn, then oats, wheat and seed down. The roots of the Quack live through it all and contribute an essential part of the grass and pasture. It inconveniences us in no way. We would not get rid of it if we could, and we could not if we would, without an impracticable amount of labor. It obliges us to cultivate hoed crops oftener, and the crops are the better for it. It is a rich grass and the roots are rich, and we have no doubt their annual decay adds to the fertility of our soil as few other grasses would. Quack annoys the farmer until by experience he is made aware of its great value.....

IT is well to prepare the ground now for Lima Beans, the most tender and delicious of all garden beans. We are now preparing a plot of a quarter of an acre. The ground has been well harrowed and fertilized with concentrated manure; holes a foot in diameter have been dug and old manure spread in the bottom. This was covered and a spat of the hoe made upon the top of the hill. In the middle of each hole a stake six feet high is stuck, and four beans will be pressed in an inch deep around the poles about the 10th of May. The holes are two feet apart—the rows three and a-half.....

LIMA BEANS should be secured to the poles by tying them with bast as the vines grow, and it seems to us best to pinch the ends of the vines as soon as they reach the top of six-feet poles, rather than to let them grow higher. It induces a stockier growth, more beans and an earlier maturity.....

THE variety of Lima which we shall plant is the finest we have ever seen, and our object is to raise them for distribution among our subscribers. Here is the note from the originator of the variety, who has never offered them for sale:—"The accompanying Lima Beans have been kept strictly pure in one family for three generations, being constantly improved by saving seeds from the strongest vines that produced the largest number of beans in the pod. When green they are very compact in the pod, and will yield almost double the bulk of shelled beans to the bushel of any other Lima. The majority of the pods contain five beans, and occasionally six.....

FARMERS and farmerines who find it very unsatisfactory to attempt the cultivation of flowers in open borders or beds, can produce a splendid effect in color about their dwellings by putting a border of flowers around their piazzas. Construct boxes about a foot deep and a foot and a half wide, or less, and of a length that will fit in between the posts or pillars; of course, leaving a space in front for entrance. Into these long boxes, or troughs, all potted plants may be set and the interstices filled with good soil, with drainage of course, at the bottom. Paint the boxes bright red, or gray, and fill them full of petunias, geraniums, nasturtiums, lobelias, asters, thunbergias, ageratums, or other bright flowers that will blossom throughout the Summer or Fall. Cypress-vine seeds dropped in at intervals will produce a graceful, drooping foliage all around. With enough petunias of varied colors—the striped and blotched varieties are most effective, with white—there will be a rim of color around the piazza until frost comes. Keep the hight of the plants equal by trimming, preserve a rounded surface, give sufficient water, and you will have a "a thing of beauty," particularly recommended to persons whose hens "scratch everything endwise." If preferred, the boxes may be covered by bark, tacked on, producing a rustic effect. Store the boxes under shelter for the Winter.....

S. W. JOHNSON, Director.

Keeping Fruit.

I wish to score two for the wet theory of preserving fruit. A number of years ago I planted an orchard in Kansas, and as soon as it came to bear I was curious to know what varieties would keep the longest. I had an outside cellar or cave, and I selected specimens of several varieties and placed them on a shelf in the cave. At that time I had not read about the dry theory advocated by pomological writers—whose statements I never venture to doubt. Rawle's Genet kept till the next September, Winesap till July or August; English Golden Russet not quite so long. A considerable portion of the time moisture was visible on these specimens. Again, an extensive fruit grower near this place plowed his orchard when the fruit was about half-grown and covered most of the apples brushed off by the team. The next Fall or the following Spring—I am not positive which—he again plowed it and turned up a good many of these apples, all in as good order as when buried.

BIRD OF SPRING.

HAIL to thee, bird of Spring,
Blithe be thy welcoming,
Send thy sweet carol o'er woodland and plain;
Sweeter notes ne'er were heard,
Sing thy song, bonnie bird,
Gladden our hearts with thy music again.

Swells thy song on the air,
Making the world more fair,
Chasing all sorrow and gloom from the brow;
Flowers will welcome thee
Gladly, dear bird, as we,
Who such a joy-giving creature as thou?

Hail to thee, bird of Spring,
Hark! now the woodlands ring,
Echo repeats every note of thy lay;
High on thy fleet wing soar,
Sing to us evermore—
Bird of the Spring-time, ah, stay with us, stay!

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

CHAPTER XVI.

(Continued from page 310.)

Moreover, the custom so common among the people of old, of celebrating social events by a feast in which human ingenuity was taxed to concoct rich and expensive dishes whose only recommendation was their capacity to tempt the appetite and please the palate, while their real effect was to induce surfeit and indigestion, must be referred to an age in which appetite is in the ascendency, and in which the intellect is used as its tool rather than its guide."

These words of Mr. Glinden's put me in a reflective mood, which for two hours after I retired to rest, kept my thoughts occupied in recalling the countless instances in the customs and habits of society in which the intellect is really used as the tool of the propensities rather than their guide.

CHAPTER XVII.

A VOYAGE THROUGH THE AIR.

I long had a desire to try a voyage through the air, but found it difficult to muster up courage enough to take it. The familiar sight of air-ships flying to and fro over the country, however, had the tendency to diminish my fear, so that when, on the day after the wedding, I received an invitation to make one of a party which should accompany the three bridal pairs on a trip to Mount Kopiah, I thought that no more favorable opportunity could be presented to look upon the world from the clouds. Especially, thought I, will the fates be propitious to a voyage which is undertaken chiefly for the pleasure of three blooming brides.

Mount Kopiah, I may explain, was a mountain peak nearly two miles and a-half high, which towered so much above all objects lying about it that an unobstructed view of the surrounding country could be had on every side. Its apex was nearly covered by a large and very substantial building, in the tower of which was a very remarkable instrument, which had the power of throwing on one of the walls of the building a panoramic view of the country for hundreds of miles in every direction, so that every object was as distinctly seen as if it were brought within the range of half a mile.

We made preparations to start before dawn that we might witness the rare sight of day breaking over the world as disconnected if not altogether disinterested spectators. There were to be ten in our party, and the air-ship which we were to use had a capacity for just that number. I may say here that every village owned an air ship of about the size of this one for the convenience of the people when they had occasion to mount the air, while if a larger one were required it could readily be obtained.

The air-ship when filled with phillego presents the appearance of a great, oblong, circular bag, of a uniform diameter for about two-thirds of its length, but terminating in an apex at either end. This bag is made of a material called plymer, which has some of the properties of rubber, but much stronger and denser, and of a lightness even greater than silk. A net work of strong cords adds strength to this material, and from these are depended the car, in which there are most luxurious seats which are single, and turn upon a swivel. Directly over the car is a sort of compliment of itself which may be lowered in cold or stormy weather, and which accurately meets the edges of the car, something after the manner that the two halves of a bivalve are brought together. In this upper part there is a continuous row of projecting windows which leaves the view of the voyager scarcely less circumscribed when it is down than when it is up. Moreover the phillego possesses wonderful heating qualities, so that when the car is closed the passengers may ride most comfortably at high elevations even in the coldest weather of Winter.

The material of the car, which was some preparation of paper, combined the qualities of strength and lightness in a marvelous degree. It was skillfully painted so as to represent the exquisite shading of a beautiful shell. In fact, when closed, it naturally suggested the envelope of some great mollusk of the deep. Beneath the car, and attached to its exposed edges, was an apparatus made of the same material as the air-bag of the ship, which when filled with phillego performed the office of a buffer when a landing was desired.

Our arrangements for an early start having been perfected, the first faint flush of approaching dawn found us all seated in the air-ship with provision, extra clothing, and all other things necessary for an air journey of five hundred miles.

The captain, or manager of the ship occupied an enclosed place in the center of the car in which he sat with all the apparatus within his reach necessary for the complete control of the ship. The balloon was filled with gas before we entered it, and ourselves and belongings being suitably placed, the captain, at the word "ready," touched a spring with his foot, and we shot up into the air like an arrow.

It was a warm morning; there was not a breath of air and the sky was perfectly cloudless. We rose almost directly upward till we had reached an elevation of nearly two miles. How rapidly did the dawn seem to break upon us in this upward journey! And what a rapid change of temperature did we experience in the morning air! Comfortable in linen when we started an overcoat became necessary within five minutes.

When we had reached the elevation of nearly two miles the captain set his propelling apparatus in motion and we traveled off rapidly toward the rising sun. We really see med flying to meet "the King of Day rejoicing in the East." He was already beginning to tip the tops of the distant mountains with his golden light, and was rapidly changing the blush of the morning into the brilliant brightness of his own strong beams. While below us lay the earth, still dark with the shadows of the early dawn. But even these seemed to lighten up rapidly as we sped swiftly eastward, till we were gradually able to distinguish the cities, then the villages, then the farm buildings and, finally, by the aid of our glasses the people themselves.

I thought I never saw a grander sight than when the sun began to peep above the horizon. Its bright rays glanced from the polished surface of our air ship and bathed us all in their genial light. We could see them running down the eastern slope of a mountain range on our right, while the shadows on the opposite side seemed by contrast to grow more dense. Before us the crescent of golden light was deepening every moment. Behind us the earth still looked cold in twilight shadows, from which we seemed to be speeding in our aerial flight to a region of genial warmth and brightness.

Having witnessed the glorious sight of day breaking over the world from this lofty elevation we descended to a warmer region of the air, and to a nearer distance from the earth, that we might obtain a better view of the country over which we were passing. At a hight of half a mile from the earth we struck a current of air which was so favorable to our course that our captain stopped the propeller and unfurled his sails, which operation he accomplished without moving from his seat. No ship was ever managed by crew of sailors more skillfully than was our air ship by its conductor sitting in his easy chair and quietly directing its course. So quietly was every operation performed that it really seemed as if the ship itself was an obedient intelligence to which it was only necessary for the captain to whisper his command that it might be at once obeyed.

We were now speeding along at the rate of a hundred miles an hour, and cities, villages, trees and all the other objects on the earth appeared at times to be flying by us with a rapidity which threatened their destruction. It was only when we looked steadily at any of the objects beneath us that we became conscious that it was not the earth but we ourselves who were in motion.

"What a country, and what a people!" I involuntarily exclaimed again and again as we sailed away over great cities, villages, and extensive farming districts. Our course lay along a wide valley stretched out between two ranges of mountains. That upon our right seemed but a few miles away while upon our left there was a great river flowing through the center of the valley, and beyond it the blue peaks of the other range could be seen, far in the distance.

The country between these two ranges of mountains was thickly settled. Great cities were spread out on either side of the river at frequent intervals, while all about them little villages thickly dotted the landscape with as much regularity almost as the streets and parks of the city. Indeed the mathematical precision with which the whole country was laid out was to me one of the most wonderful things that I saw among this wonderful people.

The natural impediments which the topography of the country must have originally presented to the laying out of rural roads and farming sections with the precision of a city seemed, in the open country at least, to have been almost completely overcome. The rugged mountain sides of course presented barriers to the engineer which it would have been neither profitable nor necessary to surmount. Among these nestled the little villages of the herdsmen, whose flocks roamed in the mountains, and were the source of supply for their peculiar product to the people of the cities and plains. But in the open country I could trace the highways by the double row of grand old elms which lined, and quite concealed them, running as straight as arrows betwen the cities, while at regular intervals other roads would cross them at right angles, thus dividing the country into rectangular sections of uniform size, except where some lake, or river, or mountain spur presented a natural boundary. When, on the main highway, at every other intersecting road, clustered the homes of the farmers, making villages of uniform size and similar appearance. The church, the school-house, the gymnasium, and the social pavilion invariably occupied the four corners where the roads crossed.

We passed over many cities in our journey, and the same appearance was presented by all. Parks of uniform size with the same number of blocks intervening between them. The same number of public buildings similarly located, and similarly constructed occupied each park, and the character of the houses about the parks was the same in all. The course of every street was marked by the all-prevading spreading elm, which seemed to be the national tree of this country, and the streets crossed each other as rigidly at right angles as the compass could lay them out. In fact, the people

seemed to live in right angles, rectangles and squares. If they had a national emblem, which, by the way, I forgot to inquire into when I was in the country, it was doubtless made up of these geometrical figures, for they were as exact and clearly defined in their modes of thought and habits of life as though they were laid out like their cities and farms, with compass and square.

There was so much sameness in the appearance of the country over which we were passing, that, despite its wondrous beauty, and the complete, prosperous, and contented aspect which it presented, we, after a time, grew weary of looking down upon it, and turned our eyes for relief to the broad river and the distant mountains, both of which presented ever-varying scenes to claim our attention.

The river especially presented an interesting sight because of the many boats which were plying upon its waters. I was surprised to see them move along so rapidly with neither steam nor sail and, upon asking from what source they derived their propelling power, I was told that it was from that very powerful factor in the marvelous time and labor saving appliances of the country, Phillego. Not only did it propel the boats, but it buoyed them up and thus by causing them to draw less water contributed to their speed.

Many other air-ships in the progress of our journey, especially near the cities were met by us, or crossed our path, or sailed for a time by our side. One of these last belonged to the trans-continental line, and was an immense thing, carrying over a hundred and fifty persons. It was really a frightful sight to me, so many persons suspended in the air, and moving through it with terrible speed under the direction of a single individual, by whose ignorance or carelessness they might all at any moment be hurled headlong to the earth below. And yet the sight was really grand, such an immense thing floating along in majestic silence, which was broken only by the merry jokes and laughter of the apparently thoughtless people whom it bore along.

For more than half an hour it sailed by our side within speaking distance. When it was known by the passengers of the Halyric—that was the name which we read on the great air bag of our fellow voyager—that we were from the city of Good-will-to-men, there was a shout of inquiry about the curious stranger who had lately appeared in that city. How did he look? How was he dressed? Was he really a fossil of an age long passed, who by some strange process had been put to sleep, and now, after the lapse of centuries, had been restored to life? And what sort of a creature must he be to belch forth smoke from his stomach!

These and a dozen other questions and exclamations on the same subject entertained me not a little, and were answered at my urgent request by Mr. Glinden, who was loth to play the deceptive part of concealing from our passing companions the fact that the very person concerning whom they were inquiring with so much freedom was within sound of their voices.

I would have made myself known to them after the conversation was over, but Mr. Glinden dissuaded me from it. He said that they would feel very much mortified if they knew that I had heard the remarks which they had made so freely about me, and his kindly regard for their feelings kept me down in my seat, out of sight.

The Captain of the Halyric had slackened his speed to keep by our side while we passed the time of day with each other; he now again set his propeller in motion and soon left us far behind. Within an hour the Halyric had entirely faded from our view.

To be continued.

For Women.

CONDUCTED BY MISS RAY CLARK.

DESCRIPTION OF CUTS.

FIG. 249.—EDGING: CROCHET AND WAVED BRAID.

For the edge: One double treble into the right-hand side of a wave of braid, three chain, one treble into the side of point, three chain, one treble into next side of point, three chain, one double treble into the side of wave, one double into next point. Repeat from the beginning of the row.

FIG. 249.

2d Row: Six trebles under three chain, one double, three half trebles, five trebles, two half trebles, one double under next, three chain, six trebles under next, three chain. Repeat.

For the heading—1st Row: One double into two points of braid together (see design), fifteen chain. Repeat from the beginning.

2d Row: One treble separated by one chain into each alternate stitch of last row.

FIG. 250.—LINEN COLLAR.

The collar is of linen, edged with pointed tabs, under which kilted lace is placed; blue silk cravat bow.

(In issue of Feb. 19th will be found the remarks referred to below. This insertion has been unavoidably delayed.]

INCREDULITY.

I AM sorry to have stirred up Alline Ray's unbelief in my "Female Farming Extraordinary," to the extent of being called upon to "explain immediately."

I will say, although I am not actually fishing for gudgeons, I should have felt somewhat disappointed without a nibble. Whoever the gentlemen (Eli Twain and Mark Perkins) may be, I claim no relationship with them whatever, but am of an entirely different family. Having been in this State for thirty years, I am what may be called an original jayhawker, with none of the marvelous or romantic in my nature.

I now turn this matter, with its many inquiries, over to the author of the work, who can rise and explain. W. F., JR.

FEMALE FARMING EXTRAORDINARY EXPLAINED.

IT pains me to find myself the object of ridicule

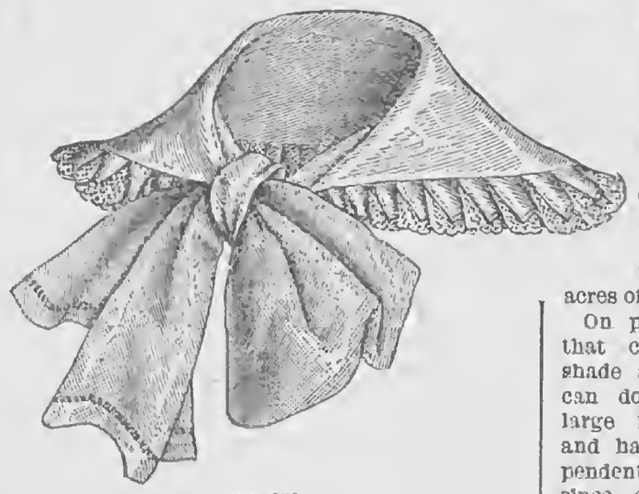

FIG. 250.

and derision in the columns of the highly prized and, with us, long loved RURAL.

My husband is somewhat given to a weakness with his pen, and last June, when he was taking the census in our district, he was a little surprised to find, even in our far western country, the female portion of the population in the majority, and naturally thinking of a means of support for them—the office of teaching being already filled to overflowing—he at last bethought him of our broad, level prairies, and, presto! why not turn their attention to agriculture? With the improved farm machinery now in use, each implement being provided with a nice spring-seat for riding, any lady can perform the work—that was once a dreary round of endless toil and drudgery—with both pleasure and profit, we, not being blessed (?) with a house full of boys to do the farm work. I have improved my spare time during the last few years assisting on the farm with very flattering success, and have not grown "gaunt and bony," but weigh twenty-five pounds more than when I commenced. To prove the feasibility of his plan, and not through any spirit of braggadocio, he innocently cited our experience. Alline Ray says she "can't believe it." Now, as this work which my husband speaks of was actually

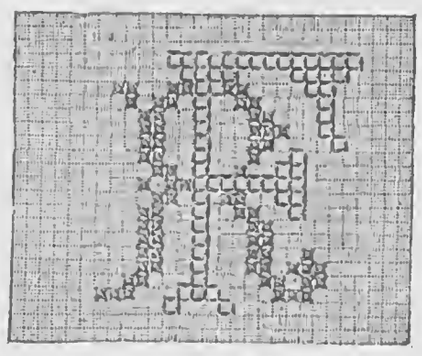

FIG. 251.—MONOGRAM IN CROSS AND STRAIT STITCH.

and fairly done by myself and daughter, I feel it necessary in justice to ourselves to confirm my husband's statement.

"I have thought of that house, wondered how many beds there were to make, and if the *extra*-ordinary (what an ugly word Mrs. Alline, it gives me the shivers just to look at it) female did them; if she got the breakfast, what was cooked for dinner? etc., etc.," are the words of Alline.

As there are but three in our family, and we are living together on the very best of terms, it follows that there are but two beds used, consequently but two to make. The breakfast is prepared and the house put in order by myself and little daughter, and by eight or nine o'clock at farthest everything is completed and we have until half-past eleven for out-door employment. We usually remain at the house two hours and a half at noon, and for dinner, as we are tea-drinkers, we have tea, warm biscuit, either cold or warm meat, vegetables and fruits in their season, butter, honey and generally some easily prepared dessert. So you see we don't starve. For supper, we have only tea, toast, sauce and honey, or something that is easily prepared.

Our family being small we wash and iron on the same day. The sewing is all done in the Winter or early Spring—I have a horror of sewing in warm weather.

Now, as I have explained explicitly how our housework is done, I will do likewise with the out-door work. But first, that little girl was fourteen years old at the time the work was done, and was in rather delicate health, so much so that we seriously thought of sending her to the mountains, but, thanks to her out-door exercise, she enters her fifteenth year rosy and blooming. Really, I don't know how to explain about the farm work! If Mrs. Alline is of some far Eastern town, as Dr. A. E. S. suggests in his reply to "Old Maids," page 90 of the RURAL, possibly the farming there is carried on in so diminutive a way that a two-acre corn-field or a three-acre wheat-field—what we would call out here a mere "truck-patch"—is considered a farm. If such is really the fact, what must she think of our Kansas farming?—wheat-fields that run all the way from forty up into the thousands of acres, and corn in a like proportion. I will try to explain, as briefly as possible to her comprehension, how our work was done.

The ground was broken with two 16-inch riding plows, one following the other, each plow drawn by three quick-stepping horses, managed by my little daughter and myself. The harrowing was done by the same three-horse teams; on the back of each "near" horse a side-saddle was placed for our accommodation.

Alline says she has been over all those 65 acres of corn. Well, so have I, three times. It was "tended" with a riding cultivator that has a wide spring seat and was drawn by two lively thoroughbred horses that never required speaking to. This part of the work I have always considered a real pleasure, and, Mrs. Ray, if you will pay our part of the country a visit next June—we will say when the corn is about up to the girths of the horses—I should like to persuade you to share my seat for one "round" behind the horses, and if you are not fascinated by the exhilarating motion and the fragrant perfume of the shimmering green sea of corn, then I am mistaken.

One more question—"that dirty work on the farm." Well, it consisted in watering, feeding, grooming and harnessing all those horses, milking those 10 cows, chopping wood, and grubbing and breaking 25 acres of sumac ground.

On page 59 of the RURAL I find an article that completely throws my farming in the shade and shows what an enterprising woman can do. A lady of New York inherited a large farming property, heavily mortgaged, and had at the time five helpless people dependent on her. In fourteen years, that have since elapsed, she has taught school, managed the farm, going into the field herself out of school hours, paid off the mortgage, and become an extensive stock raiser. I have done nothing of this kind—paid off no mortgage, nor had any helpless ones dependent upon me—but I have helped to pay for 80 acres of land that we added to our little farm last year.

As the statement was doubted, I have been forced to enter into a somewhat lengthy detail, but I rely upon the forbearance of editor and people.

MRS. L. F., JR.

APRONS.

APRONS and aprons, big ones, little ones, light ones and dark ones; every woman and every child should possess a good supply of these. I will go farther and say, *can* possess them if they will. But, says Mrs. Poverty, I should like aprons, but we have so much to buy that is necessary there is never anything left for them.

Yes, says Mrs. Showy, aprons *are* real nice, but I have so much to do that is necessary I cannot find time to make aprons even for the children. And so Mrs. Poverty goes on in her penny-wise way, wearing out her dresses with washing, or, worse yet, wearing them so dirty that they are disgusting. Mrs. Showy sits down to make lace bibs for her little girls, in a cambric wrapper that is so soiled you can scarcely distinguish the figures on it. These bibs are *necessary*, you know, and so are the ruffles and pipings and folds that adorn all the clothing of mother and children in the Showy household. You and I know plenty like Mrs. P. and Mrs. S. Maybe some of them read the RURAL; if so, may they repent of their ways and go to making aprons.

Mrs. Poverty, when you get a new calico dress, omit the over-skirt and have two aprons; this will give you a start, then take the back breadths of your old dresses and make some more. You need not put much work on the making, and they will pay you. Why, before you know it you will have a good supply of these real necessary articles.

Mrs. S. has only to have some of her clothing made up plainly and time will be found to enable her to have the means of cleanliness in the shape of aprons.

What a comfort a drawer full of kitchen aprons is; with these at hand one is always ready for any unexpected call to work.

Pretty white aprons for mother's and the girls's afternoon dress up, are both useful and ornamental. They need not be expensive or fussy, but if clean will give an air of refinement to their wearers, no matter how plainly the dresses may be. Every one with common sense must see the necessity of aprons for children, and I wont waste words on the subject, but will suggest that it might be well for every farmer (man) to have at least one big butcher apron to wear on occasions when extra dirty work is to be done. I do it, how-

FIG. 252.—BOUQUET FOR THE HAIR.

ever, with fear and trembling, knowing *men* are not fond of "apron strings." MILLY BIRD.

HOW TO MAKE A DOLL'S HOUSE.

I WOULD like to tell mothers, sisters, and other friends of the little girls how to make a doll's house that will cost only a little time and patience and give as much pleasure to all concerned as one that is much more costly.

Perhaps I can tell better "how to do it" by describing how one was once made for a little friend. A large, strong pasteboard box was the empty, unfurnished house. It was opened at the side. A gay pattern for Berlin wool-work, cut out of a fashion magazine, was pasted on the bottom for a carpet. Some small pictures from papers, framed in strips of bright paper were hung, or, for safety, perhaps pasted on the walls. The furniture, a sofa, bedstead and table, was made of stiff box-board; the different parts cut out with sharp shears, and securely joined with needle and thread, then covered with paper of a light color, and finished at the edges with strips of blue paper. The back of the sofa and the headboard of the bedstead were adorned with tiny, bright pictures. To make the table, a round piece of box-board was attached to each end of a spool, and the whole was covered with blue cloth, a piece of ribbon tied just around the middle or the spool gave it an hour-glass shape. The bed was furnished with matresses and sheets, a little quilt made of tiny patchwork pieces, and pillows in little cases trimmed with edging.

A new doll to inhabit this small house was also manufactured, a real rag doll, with an attempt at shape that gave her a very round face and a semblance of neck and shoulders. Eyes, nose and mouth were added with a lead pencil. A "lock" from and old mohair switch furnished her head with hair which was braided and tied with a narrow ribbon. Then a neat blue dress, trimmed with white made her very presentable.

FIG. 253.—MONOGRAM IN SATIN STITCH.

This inexpensive doll's house gave pleasure, though in different ways, both to the little owners and to the grown-up designer.

The finishing and furnishing of such a doll's house may be plain or elaborate, or as the materials at hand permit. A light wooden box may be used, if pasteboard is not considered strong enough. Remnants of wall paper can be used to cover the floor and walls or a piece of cretonne would make a carpet. If a window is wanted the outline may be drawn on paper with a lead pencil and pasted in its place; curtain and cornice can be made out of a scrap of muslin and a bit of gilt paper. The furniture may be designed after any easy pattern, and covered either with paper, or with remnants of a bright colored dress. In almost every house in the land there are little chromo cards that will be "just the thing" to hang on the walls, and tiny scrap pictures may be used to decorate the furniture. It will not be difficult to design an ornamental roof, if such an addition is desired.

If any reader of the RURAL determines to make a house on this plan, she will find pleasant recreation in the work and may give untold pleasure to some little girl whose dolls have no home to call their own. If you have any taste, real or fancied for artistic furnishing and decorating it may be exercised *ad libitum*. MARIGOLD.

AMERICAN CARPETS.

IF any one should be so much behind the times as to suppose that under the head of "American Carpets" something patronizing and encouraging is to be said of a new American industry, let him disabuse himself of this prejudice. The manu-

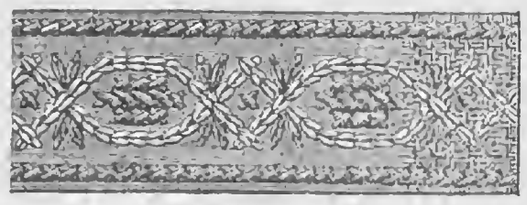

FIG. 254.—DESIGN FOR BORDER EMBROIDERY.

facture of American carpets has passed that stage where it stood in need of kind and condescending words. It now challenges rivalry, not merely in those simpler and less expensive carpetings that have been chiefly in demand in this country, but with all the finer products of the European looms. As we have said, the American manufacturers have now carried their products to so high a degree of perfection that they are willing to place them in open competition and comparison with the best European work. This is especially true of Messrs. J. & J. Dobson, 40 and 42 West Fourteenth street., the leading carpet manufacturers of this country. The extent of their business may be gathered from the fact that their works on the Schuylkill River employed two years ago more than two thousand hands. Since that time the rapid increase of the demand for their fabrics has compelled them to enlarge their works, add new looms, and engage a larger force of skilled weavers and dyers.

Their house in this city, where the products of their looms are placed on sale, is one of the places visited not only by throngs of buyers but by the inquisitive stranger who is interested in the progress of American industries. It is well worth visiting. The fabrics here displayed are of a rich and substantial quality. Let the visitor compare the axminsters and moquettes, the wiltons and brussels and the tapestry carpets with the foreign carpets of the same kinds. In the quality of the material, the thoroughness of the texture, the beauty and richness of the dyes, and the artistic character of the designs he will find no inferiority. But in one respect he will find an inferiority, especially this spring—an inferiority of price.

Mr. John Van Gaasbeek, the manager of

Dobson's New York house, has the advantage of a long experience in this business, and is well qualified to assist in supplying the wants of all in any style of floor covering.

CORRESPONDENT'S CORNER.

WILL Mary Wager-Fisher tell me how long it will take mulberry trees to grow from cuttings? Her letter on silk culture interested me greatly, and I would like to ask for more information. Will it be best for me to write to the Association for said information? I am anxious to make a "Little Money," and what she says about silk culture seems to make it an easier way than school teaching. What color is a topaz, and how does it rank in value compared to other precious stones? Respectfully, MRS. V. A. R.

We submit the first questions to the person queried. Topaz is generally yellowish, sometimes of other shades. It admits the passage of light, although not transparent, hence its variation of color. The topaz and amethyst are of equal value.

Hop Bitters have more patience than Job, curing thousands of patients daily.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

ANOTHER WEEK FROM MRS. CLAY'S JOURNAL.

ANNIE L. JACK.

THURSDAY—Several of the neighbors came in today and our talk was of the foolish changes made by fashion in our dress and the extra work it entails. Mrs. Merrett, who has four little girls, says she gets her dresses made and lets them be worn out without any alteration except such as is necessary from growth of the wearer or in repairing. I talked of my troubles and how useless I thought the double amount of cloth was in making suits, when the plain princess was so much neater than all the shirring and plaiting. How tired I am of going into a house and seeing the women devoting all their spare time to the plaiting machine, that superfluous attachment of the sewing machine. Yards and yards of cloth wasted, and time and strength too. They laughed at my old-fashioned ideas, and one lady, looking at my plaited skirts, quoted:

"She blamed and protested, but joined in the plan."

Yes, so do we all, for who dare risk the charge that any deviation brings forth. "She is rather eccentric," with a volume in a shrug of the shoulder.

Then we talked about breakfast, and I said it was the most troublesome meal of the day to prepare. Men who have to work, either with head or hands, require something nourishing and substantial. In our home we take oat-meal porridge, made with good, coarse Scotch meal, every morning as a first course. But the trouble seems to be to get variety for the second part of the breakfast without the time or trouble required by an elaborate meal. "I like to see the table neat and garnished with pretty things," said one of my callers, "but the trouble is to get leisure for such, when there is so much of the inevitable to do."

It is a pity that when people call they would not always study to talk on subjects that will help them to strengthen each other by a multitude of counsel. I sat silent for an hour one day not long since when calling on a dear friend whom I had journeyed ten miles to visit, while a neighbor called in and regaled us with the accounts of her last change of servants; how this one was dishonest and that one impertinent, and when the caller left I breathed a sigh of relief and thought regretfully of the precious hour we had lost.

Karen tried her hand yesterday at making a very economical pudding. She had found the recipe in some newspaper, and, though I doubted her skill it seemed cruel to refuse her permission to make it. The ingredients were flour, a little sugar and a few raisins, mixed to a proper consistency with a little butter-milk in which half a teaspoonful of soda had been dissolved. It was put in a mold and boiled two hours. Eaten with sweet sauce, we did not fail to praise the little cook, though at one point she had been near spoiling the whole. Looking into the pot while the boiling process was going on, she saw the water had evaporated, and, taking a dipperful of *cold* water, was about to pour it in when I stayed her uplifted arm with the remark, "That will make your pudding heavy. You must keep boiling water with which to renew." It is by being allowed to experiment, and sometimes even to spoil a thing, that children learn many arts they must in some way reach.

MAKING OMELETS.

CHIEF COOK.

THE foundation of an omelet is a very simple affair upon which many a magnificent structure may be built. Beat up six eggs to a stiff froth, add a gill of cream or milk. Pepper and salt and fry in hot lard. That is the foundation. Fry brown on the lower side and when done turn one-half over on the other, but never turn it as in cooking pancakes. That is the way to cook it. Now there is no end to the embellishments, and they are all delicious. To make a cheaper article add bread crumbs or pounded cracker, or flour, or even Indian meal; these are hearty food and more solid than the foregoing. Again, chopped ham, or chopped onion, or chopped parsley, or chopped tomatoes, or chopped oysters or clams, or fish well freed from bone, crumbs of old, dry, high-flavored cheese, tomato sauce, tomato catsup, shalots, in fact, anything which may be eaten with eggs or milk is suitable, and may be used singly or in combination to suit the fancy. So much for pepper and salt omelets.

For sweet omelets, a rare dish, any high-flavored preserves of fruit may be employed. It must be remembered that the milk and eggs are only a vehicle to carry the flavor, which must be piquant. Adhere to the foundation, and then let your fancy dictate the rest.

HELPS.

MENDING WORKING PANTS.—I find it economical to use No. 8 thread instead of black linen; it answers the purpose just as well. As soon as pants get thin at the knee I cut the legs off one inch from the seat; then neatly darn, laying a piece under the thin place if necessary, after which I back-stitch the right leg on the left top, and *vice versa*, thus placing the thin part at the back, where the darning receives no more strain and is unobserved, when the front is so thick over the knee that it will last as long as the remainder of the pants and shows much less than a "patch" if the above seam is nicely pressed.

KITCHEN APRONS.—I have, to my notion, just "the thing," and it is an improvement over those banded at the waist, wrinkling a freshly-ironed sack. This kind entirely protects one's dress. I take one breadth of cheviot the length from the back of my neck over the shoulders and reaching to the bottom of my dress in front; then cut out the neck and sides of waist full width of front, having it rounded to come about to bottom of waist; then measure from the waist down, and split, sewing raw edge to each side. Round the lower corners and either take a very long strip of some other color to face it on the right side, three-fourths of an inch wide, or hem it all around. It is nice to get blue and brown cheviot and trim one with the other. Put a button and button-hole back of the neck and waist. One lady cuts the top straight across and pins the bib, but I prefer it to go around my neck and neatly button. The neck should be cut sufficiently large to show one or two buttons on front of dress.

WORKING DRESSES.—For a long time I have been convinced it was better economy to use for working dresses cheviot or gingham than calico. It wears two or three times as long and requires but one making. Thanks to Mrs. Fisher for the idea of the sleeveless basque, as it obviates the gathers at the back. MRS. J. M. MATTHEWS.

DOMESTIC RECIPES.

Salad Dressing.

THIS is especially nice for lettuce and as it will keep two or three weeks, if bottled, corked and set in a cool place, it is very convenient to have on hand. The yelks of eight eggs beaten light, to them add a cup of sugar, a table-spoonful of made mustard, one of salt, one of black pepper, a little cayenne and a half teacupful of thick sweet cream. Mix thoroughly. Put over the fire one and a half pint of vinegar and a cup of butter. Let boil and pour over the other ingredients, stirring as you do so.

To Color Madder-red

For four pounds of goods take two pounds of madder and four ounces of madder compound. First soak the madder for 24 hours in soft water enough to cover the cloth, then add the madder compound. Wet the cloth in soft water, wring out, put with the dye into a kettle over the fire and bring to almost the boiling point. If a light red is wanted, keep the goods in the dye at that temperature for half an hour. If a darker shade is desired keep in longer. Rinse in soft water.

To Color Tan.

For 10 pounds of goods. Boil for four hours half a bushel of ground tan bark in water enough to well cover the cloth. Strain the dye and put in the cloth. Let stand three or four days in the sun or by the stove airing several times a day. Keep goods under the dye. Rinse in clear water and dry in the shade.

Rhubarb Pudding.

Strip the stalks and cut into half inch lengths. Cover the bottom of a pudding-dish (earthen is best) with slices of light bread, buttered, strew over the rhubarb and sprinkle liberally with sugar. Thus alternate until the dish is almost full. Cover and bake three-fourths of an hour, then remove the cover and brown. J. L. X.

Strawberry Wine.

One quart of juice (mash and strain the fruit through a flannel bag), a quart of water and a pound of white sugar. Stir until the sugar is dissolved. Let ferment in a clean jug, leaving the cork out. When done working turn off into bottles, cork and keep cool. Very nice for coloring puddings or flavoring sauces.

Pickled Cherries.

Pickle as soon as taken from the tree. Leave the stems on. For every quart bottle allow a coffee-cupful of good vinegar, two table spoonfuls of white sugar, with a few whole cloves and sticks of cinnamon. Bring the vinegar, sugar and spice to a boil, then turn into an earthen dish, strain out the spice and let get cold. Nearly fill the bottles with cherries and pour the cold vinegar over them, Cork tightly.

Orange Roly-Poly.

Make a light paste as for apple dumplings, roll into an oblong and cover thickly with oranges peeled, sliced and seeded. Sprinkle with sugar. Roll up closely, folding and pinching down the edge to keep in the syrup. Steam an hour and a half. Eaten with cream and sugar, hard or liquid sauce. MARY B.

A palatable dish for dessert is

Oatmeal Pudding.

Take of cooked oatmeal (frequently left over from a meal), one cupful, to which add two and one-half cups of sweet milk, two eggs and one-half cup sugar. *Stir well together* and season with nutmeg, then bake. If the whites of the eggs are beaten separately and, after the pudding is baked, laid upon it and allowed to brown nicely, it is dainty enough to set before royalty. MRS. J. E. S.

Keystone Washer.

Will some of the lady readers of the RURAL give their experience with the Keystone Washer, and oblige MRS. V. A.

Purify the blood, Cleanse the Stomach and Sweeten the Breath with Hop Bitters.

News of the Week.

HOME NEWS.

MONDAY, May 9, 1881.

Last Thursday the "deadlock" in the United States Senate was broken by the Republicans, who consented to an "executive session" for the consideration of the treaty with China, and for the confirmation or rejection of a large batch of folks whom President Garfield had appointed to fill various offices "by and with the consent" of a majority of the Senators, as provided by the Constitution. The "deadlock" as mentioned in a former issue, was due to a wrangle between both parties about the appointment of the officials attached to the Senate. The present office-holders were appointed by the Democrats who then had a majority; and the Republicans having lately obtained a majority by the vote of Senator Mahone, attempted to substitute Republicans, which under ordinary circumstances there would have been no difficulty about, according to the customary routine in such matters. The Democrats, however, insisted that Mahone's vote was won by a "bargain" that he should be paid for it by getting the Federal patronage in Virginia. This, it was feared, would enable him to carry that State against the straight-out Democrats next Fall, and to begin a split of the "Solid South." His chief aid in Virginia politics was a former Confederate officer named Riddleberger, and him the Senators nominated to the position of Door-Keeper who has a good bit of patronage in his gift. Gorham, the last Republican Secretary of the Senate and a friend of Mahone, was renominated to his former position, and the Democrats, objecting to both of these nominations, prevented their confirmation by raising dilatory motions, similar to Parnell & Co.'s "obstructive tactics" in the British Parliament. The Republicans, maintaining that it is the privilege and right of the majority to rule in such matters, insisted on the confirmation of their nominees, knowing that success would aid Southern malcontents to split the "Solid South"—hence the deadlock. It added to the complication that President Garfield had renominated Judge Robertson, a bitter enemy of Senator Conkling, to be "Collector of Revenue" at this port, the richest berth in the gift of the Government—worth from $100,000 to $250,000 a year—and one with so much patronage that its incumbent, if an active politician like Robertson, could greatly cripple Conkling and his "stalwart" following in this State. The two Senators from New York, Conkling and Platt, and Vice-President Arthur, without whose knowledge the nomination was made, strongly objected to the confirmation of their foe, and won over enough Senators to "hang up" the matter in the Senate. The "putting off" of this question added to the deadlock.

The Republican Senatorial caucus which last Wednesday decided to break the deadlock agreed not to act in the Senate upon any of the President's nominations in States whose two Senators objected to the nominee. This was to prevent the confirmation of Robertson. On Thursday the President withdrew from the Senate several rather important nominations he had made among the friends of Conkling before he had decided to "make war" upon him, intimating that if Robertson were confirmed he would re-nominate Conkling's friends, but not otherwise. The New York Senator is a sturdy fighter and it now seems impossible to avert a four years' struggle between him on one side and the whole force of the President with his vast patronage on the other. The battle is really for the next Republican presidential nomination, though immediately it is about the "spoils," but mainly on account of the influence their possession will have on the nomination, which Garfield and Blaine are afraid Conkling may prevent either of them from obtaining. Republicans are distressed; Democrats jubilant.

A reception to Gen. Grant by the American Minister at the city of Mexico, the other night, was attended by the Mexican Cabinet, Supreme Court, Members of Congress, the Diplomatic Corps and an immense throng. There was great cordiality.

The project of establishing a grand International Park at Niagara has broken through for the present, the authorities of this State not being willing to incur the expense of co-operating with the Canadians.

The ratio of vote to population in this city, at the last Presidential election, was about one to five; in Philadelphia and Chicago, one to six; Boston and St. Louis, one to seven; in New Orleans, one to nine, and in Providence, one to eleven.

The World's Fair which was to be held in this city or neighborhood in '83, won't. The Executive Committee last Wednesday about decided to ask Congress to discharge them from the duties they accepted under the statute. There are at least 5,000 splendid, unanswerable reasons why it is to the honor and benefit of this city that the fair should not be held; but want of space, of course, prevents us from giving them here.

A million dollars of marriage portion is said to have gone with Whitelaw Reid's bride.

Kenward Philp, the Truth editor, arrested for criminal libel in writing the editorial, "Lying and Sticking to It," will prosecute the papers and parties who instigated his prosecution.

John M. Wilson, United States consul at Panama, who has lately arrived in Washington, says nothing like serious work has yet been attempted on the De Lesseps canal. No houses have been built, but the men are living in tents and will soon be driven out by the storms. It does not look as though De Lesseps ever intends to dig a canal there, he says.

In Canada, it is claimed that the protective tariff against the United States has largely increased the price of every article of consumption, and that a corresponding increase of wages should be given.

It is discovered that Erie, Pa., has not had a legal grand jury in ten years, owing to the jury box being sealed with mucilage instead of wax, as required by law.

The New York state geological survey has lasted over 40 years, cost over $1,000,000, and is not completed yet. There is a disposition on the part of Gov. Cornell to drop it, by vetoing the current annual appropriation for a salary to the State geologist, James Hall, appointed in 1835.

Gen. Wiltz, of Louisiana, is improving in health, and has left New Orleans for the parish of St. Martinsville, hoping to gain increased strength from the salt breezes from the Gulf of Mexico.

The largest tannery in Canada, situated on the lower Lachine road, four miles from Montreal, was burned on the 5th. Loss, $75,000.

Col. Fred Grant, who has resigned from the army, is to be President of the Texas Western narrow-guage railroad, a line 660 miles long, from Houston to El Paso, of which 42 miles only have been built. Capital has been subscribed for the entire line and 200 miles are to be built, it is said, this year.

The lumber cut upon the Wisconsin shore of Lake Superior has increased from 4,000,000 feet in 1874 to over 22,000,000 feet in 1880–1881.

The total loss of property by the floods in the Missouri River and its tributaries between Sioux City, Iowa, and Bismarck, Dakota, is estimated at $2,500,000. Below Sioux City, including the damage at Omaha, Council Bluffs, Kansas City and thence to St. Louis, the loss is estimated at $1,500,000, making the aggregate $4,000,000. Five or six days ago the flood had reached St. Louis, where it has submerged the low-lying districts on the west side of the river and the greater part of East St. Louis on the opposite side, doing a great deal of damage to the railroads and to all the other property there. On its way towards the Gulf it is sure to do a world of mischief along the rivers. The other Western floods are subsiding.

Senator Edmunds has gone to his Vermont home on account of continued ill-health, and will not return during this session.

Sarah Bernhardt and her company sailed Wednesday for France on the steamer Amerique.

A Physician's Report

Many physicians are using Compound Oxygen in their practice, and with remarkable success. One of them writes: "My patient has now been under treatment about four weeks. His condition at *the time of beginning the Treatment was very unfavorable indeed;* he was very feeble, severe cough, expectorating pus in considerable quantity; he suffered with night-sweats; all of his friends considered his case as hopeless. Every symptom has improved; his cough is very much better; his strength and general appearance has improved a hundred per cent.; in fact he has the appearaco of a new man." Our Treatise on Compound Oxygen, containing large reports of cases and full information sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

Large amounts of California barley travel 3,000 miles to be malted in Chicago.... ....A beet sugar factory at Schenectady, N. Y., expects to get back its cost—$150,000—in four years, by jewing down farmers to $4 per ton for beets.....By Indiana's new Road Law, local supervisors have been abolished, and Township Superintendents, chosen for two years, substituted, who take entire direction of road and bridge making and improvements. A capitation tax of $2 per annum is levied on every able-bodied man between the ages of 21 to 50 years inclusive, which the citizen may "work out," and Superintendents receive $2 per diem.....Among charges preferred by the faculty of Dartmouth College against President Bartlett before the Board of Trustees is that he has shown a positive hostility to the agricultural school connected with the college—the man is also accused of being rude and overbearing to the faculty and of having incurred the intense dislike of the students..... In reply to a resolution passed by the Board of Aldermen of this city, Pres. Chandler of the Board of Health reports to that body that in his opinion no legislation about oleomargarine is needed to protect the public health. The process of manufacture, he says, is cleanly, the materials used are unobjectionable, and the product is a wholesome food, equivalent chemically to butter, palatable, and better, as well as cheaper, than much of the dairy butter sold in this city. On this point he says chemists who have looked into the subject are agreed, and he quotes the right Hon. Dr. Lyon Playfair as saying that good oleomargarine at 1s. the pound is a great deal better and cheaper than bad butter at 1s. 4d. In saying this Pres. Chandler merely repeats the paid-for opinion he gave some time ago for advertising purposes to the Commercial M'f'g. Co., of this city, the largest makers of oleomargarine in the country..... There arrived at the New York Central Stock Yards Monday night from Cincinnati what is called by the company owning it a "parlor cattle car." It contained 20 cattle in two rows of stalls, built at an acute angle with the sides of the car, with an aisle between the rows. The cattle could lie down, and were fed and watered on the journey by a system of water and grain pipes, leading to galvanized iron troughs, and fed from outside the car. The heads of all the cattle were toward the side of the car, and the floor has a slight pitch toward the center, where it is drained through an iron grating in the center. A maximum of carrying capacity, with a minimum of weight is claimed for the parlor car.....The Raleigh (N. C.) News notes the great increase in truck farming in the eastern part of North Carolina in recent years, and predicts that this is to become the most important source of the future wealth of that section.....The Trustees of the Maine Agricultural College announce that they will be compelled to charge a tuition fee of $30 per year hereafter, because of the failure of the State Legislature to make adequate provisions for the support of the college. .....All the small fruits in the Hudson River fruit region give promise of good yields, the growers maintaining that the extreme cold and snow have been favorable, having kept the buds back and prevented them from bursting forth and being blasted by Spring frosts. Good crops of strawberries, raspberries and blackberries are expected. About 200,000 peach trees in Marlboro come into bearing this year for the first time..... Henry Ward Beecher while passing through Baltimore, Wednesday, was served with a summons to answer a suit against him by the Western Maryland Agricultural Society, for failure to deliver an address as agreed upon at the Society's fair two years ago .....In Colorado it is said that 97 per cent of the cattle have survived the Winter. If this proves to be, in general, true of the high lands in the arid belt, and there is reason to believe that it is, the loss from the Winter will prove less than was expected.....The following reports are condensed from the latest telegrams and exchanges: Richmond, Va., reports: "We are to have a good peach crop this year if no further damage is sustained." .....Galveston, Texas, reports heavy frosts throughout the State that have done great damage to cotton, corn, fruits, and vegetables..... In the old North State, a wonderful place for blackberries and huckleberries, half the crop was killed by the frost of April 6.... ...All the fig trees around Opelika, Ala., were killed last Winter, and the peach crop will be an entire failure. The wheat looks very fine..... A Macon paper says: "The plum crop is successful so far, the apples are still unhurt, and the peach trees are literally laden with fruit."....A great fruit grower of Oskaloosa, Kan., reports his peaches killed, as well as his cherries, except the late Duke and the Richmond varieties.....No peaches, a light crop of raspberries and blackberries, a heavy crop of apples, and an average yield of strawberries are the prospects reported from near Terre Haute, Ind.....In Texas some varieties of peaches are seriously injured, but others are yet good for a full crop if there is no more frost. Grapes, berries and plums are reported to be all right.....Fruit growers of Maryland and Deleware have no encouraging reports to make. One farmer in a celebrated peach center says that he cannot find a live peach bud on 10,000 trees..... Abbeville, S. C. reports that but slight harm has been done thus far to the fruit crop. The cold has killed a good deal of the fruit about Anderson, S. C. but enough is left for ordinary uses..... Illinois fruit growers from the east shore of Lake Michigan say the crop near the lake is not materially damaged, but four miles inland scarcely any live buds can be seen. The trees are not injured. ..... Sweet corn in the South was planted early in March, and came up late only to be bitten by the April frost. The ladies of Macon, Ga., are crying over their flower gardens, on which the cold snap has worked havoc....The Charleston, S. C. News says that the recent frost was terribly fatal to fruit and early vegetables, though not nearly so bad as it would have been if the unusually cold Winter had not retarded their growth. .....There is general promise of fine crops of cherries, plums, grapes, raspberries, and strawberries in Michigan which is the great source of the late fruit supply for Chicago. St Louis, Cincinnati, and even the Eastern markets.....Thirty special reports to the Telegraph and Messenger of Macon, Ga., indicate less than a half crop of fruit in middle and southwestern Georgia. The fig trees are killed, plums a half crop, pears and cherries badly damaged, apples and strawberries not much injured, and the Le Conte pear a failure. .....California comes in with more cheering reports. Sacramento growers say that not more than thirty-three per cent of the fruit crop will be lost. Oranges are a good crop. Red Bluff, Tehama County, reports a full half crop. The Amador County peach crop is not so badly damaged as was thought. Fruit trees, other than the peach and almond, are now in full bloom. Napa County reports that cherries only have suffered by frost, and they only a little..... Over $23,000 were paid for a herd of Jersey cattle, consisting of six bulls, fifteen cows, and twenty-one heifers, on Thursday last, at the American Institute Building, this city. They were sold by Peter C. Kellogg & Co. for John D. Wing of Millbrook, Dutchess County, N. Y. The pure Alphea bull Polonius was purchased by the Alma farm for $4,600. Horatio, sired by Polonius, was sold to William Crozier for $560. Fancy Fan, a cow, was bought by the Alma farm for $2,000. Holly Branch, a cow was knocked down to John J. Holly for $550. Young Duchess, a cow, was secured by the Alma farm for $1,200, and Palm, a cow, for $1,550. The largest price, $1,258.50, for a heifer, was paid by John J. Holly for the Surprise of Maple Shade, a yearling. Glint, a heifer calf, was sold for $250, and Fancy Fan for $375..... The softer and inferior qualities of wheat are of little use to Minneapolis millers, and measures are being taken to provide the Minnesota farmers with the best seed wheat obtainable. To that end the Minneapolis Millers' Association has been purchasing a considerable amount of "No. 1 hard," at from $1.10 to $1.13 per bushel, all of which will be sold to farmers at the uniform price of $1.10..... ...At Chicago it is said that several of the leading packing houses which have been idle for a considerable time are now getting to work again. This will increase the requirements for hogs, which are expected to move more freely to market henceforth.....Navigation on the lakes has been resumed between Toledo and Erie, and quite a number of vessels have cleared from the former for the latter port. Several vessels have cleared from Milwaukee and Chicago, but the ice, at the latest accounts, was still obstructing the passage of the Straits. Buffalo reports several arrivals and departures of vessels by lake, and Oswego has received by lake from Canadian ports quite a quantity of barley, rye and peas.....The Eastern division of the Erie Canal is to be opened on the 12th instant, and the remainder on the 18th instant. The opening of the Eastern division will release about 1,200,000 bushels of wheat, about 3,800,000 bushels of corn and a few thousand bushels of oats, barley and rye..... ....Last Saturday Commissioner Le Duc exhibited, here 19 samples of tea grown under his direction at McIntosh, Ga. The tea was a heavy black sort for which there is little market here, though it is largely used in England for mixing with other kinds. Experts who tested the beverage made from it say it has a strong body, but little flavor. The Commissioner hopes to be able to use machinery in some parts of the process of curing it...

Large quantities of potatoes are being shipped from Canada to the "States," 16,000 bushels having lately been sent across from Montreal, in one week.....The sale of the farm belonging to the Minnesota State University, near Minneapolis, is under consideration, on the ground that it has failed to interest the students in agricultural practice. The University, having gobbled up the U. S. endowment for an agricultural college, now seems to wish to crawfish out of all obligations in that connection.....A telegram from Chicago this morning announces that Railroad Commissioner Fink on Saturday informed railroad agents there that rates on live stock will be reduced, beginning to-day, on the basis of 35 cents per 100 pounds gross and 25 cents net to New York. The regular tariff rates are 60 cents gross and 50 cents net. On dressed beef the rate is reduced from 80 to 40 cents. These reductions are made on account of persistent cutting by various roads.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, May 7.

Cincinnati.—WHEAT strong; No. 2 Red Winter $1 13; CORN strong; No 2 Mixed, 47½c@47¾c. OATS dull No 2 Mixed, 39½c. RYE strong; No. 2 at $1 23@1 25. BARLEY scarce and firm; No 2 Fall, $1 15. PORK buoyant at $17 50. Lard quiet at $11 10@11 15 Bulk meats quiet, but steady; Shoulders, $6; Clear Rib, $8 60. Bacon scarce, firm and unchanged. BUTTER.—There has been a decided improvement in the average quality of Creamery, but the supply is much larger and the tendency is still downward. Fancy Creamery sells at 27@28c. prime do. at 25@26c, choice Dairy at 22@23c choice Western Reserve at 20@21c, prime to choice Central Ohio at 15@18c., medium do. at 12@13c and inferior at 10c ₱ lb. CHEESE.—The supply of choice cured factory is exhausted and some good to choice new Ohio factory is arriving and selling at 10@11c per lb. There is still some Northwestern which is offered at the same prices. Eggs have been in less active demand during the week and have further declined, closing dull at 10½@11c per doz. Packers bid only 10c for round lots. SEED.—There has been some demand from the Eastern markets for Timothy and some inquiry for Clover Seed but for the latter at lower prices. German Millet has been active and has sustained a further advance. Prime to choice Clover is held at 7½@8c ₱ lb, and Timothy at $2 65@2 75 ₱ bushel from store. Round lots on arrival would not bring these prices. Flaxseed is steady $1 10@1 12½ ₱ bushel. German Millet sells at $2 25, common Millet, at $1 50, and Hungarian Grass at $1 25 ₱ bushel.

Chicago.—WHEAT in fair demand; No. 2 Chicago Spring, $1 03½@1 03⅝, cash; $1 05@1 05⅛, June and July; $1 01, August. CORN active at 43⅜c, cash: 42¾@42⅞, June; 43⅜c, July; 44⅛c., August. OATS steady and firm at 38½c, cash; 33½c, May; 37½@37⅝c June; 36½@36¾c, July; 29½@39½c, August. PORK easy at $17 30@17 35, cash; $17 30, June and July. Lard active but lower, at $11, cash and June; $11 05, July; $11, August. Bulk-meats irregular; Shoulders, $5 80; Short Rib, $8 70; Short Clear, $8 95. BUTTER—Choice to fancy creamery, 23@24c; good do., 20@22c; choice to fancy dairy, 20@22c; good do, 15@17½c; common to good Summer and Fall made, 9@10c; good ladle packed, 12@13c; good to fine do 16@18c; the outside prices are only obtained for small lots. CHEESE—Full cream, good to choice, 13@14½c; flat, part skimmed, prime, small way, 9@9½c; do. in lots, 8½c; sour and hard skimmed to medium stock, 3@6c; Cheddar, skimmed, good to prime, 6½@8½c. GRASS SEEDS—Timothy in good supply, but chiefly included fair to medium qualities for which there was only a moderate demand, and prices rather easy. Timothy good at $2 62@$2 75; and small lots of fancy at $2 80; common to fair $2 40@2 50. Clover dull at $4 for prime medium down $3 70 for common do. Mammoth at $4 80@$5 50. Hungarian at 90c@$1. Millet at 90c @$1 30 for common, and $1 50@1 65. Flax active at $1 15 for crushing. HOGS—Fair demand, chiefly for packing; mixed packing, $5 70@6; light, $5 75@$6 10; choice heavy packing and shipping, $6 10@$6 85. CATTLE—market strong and active; fair to good, $5@5 60; choice, $5 75@6 15; no extra here; distillery Steers strong and plenty at $5 60@5 75; tailings, $4 30@5; butchers' very strong and active at $2 75@5; stockers and feeders in good demand and firm at $3 85@4 95. SHEEP—Market weak with a decline for the week of fully 75c; shorn, $4@4 50; wooled, $5 70@5 75; no extra heavy here.

Boston.—GRAIN.—Corn, 60@61c. for mixed and yellow; no grade at 55@58c. ₱ bush.; and to arrive at 60@60¾c ₱ bush. Oats have been quiet, with small sales of No 1 and extra white at 52@55c.; No. 2 white at 50@50½c; and No 2 mixed and No. 3 white at 48@49c ₱ bush; rye at $1 25 ₱ bush., and barley at $1 05@1 15, ₱ bush; shorts at $19@19.50 ₱ ton; fine feed at $18.50@19, and middlings at $20@21 ₱ ton. BUTTER — New

Northern—Vermont dairy lots, choice, 21@22c.; N. Y. dairy lots, choice, 21@22c.; fair to good, 14@18c. New Western—Choice creameries, 21@25c.; do. fair to good, 20@23c.; ladle packed, choice, 18@19c.; do. fair to good, 15@17c. Old butter—Creameries; 18c.; Fall made dairy, 18c; choice dairy, 10@13c.; common to good dairy, 10@15c., and Western ladle packed 10@15c. CHEESE — Northern factory, choice, 13½@14c. ℔ lb.; fair to good, 11½@13c.; skimmed, 6@11c.; Western factory, choice, 13½@14c.; fair to good, 11@12½c.; skim, 7@10c. EGGS—Eastern at 15½@16c.; Northern, 15½c.; Western, 15@15½c ℔ doz. BEANS—Northern hand-picked pea at $2.70@2.75 ℔ bush.; do. New York at $2 60@2.70; do common at $2 40@2 50; medium choice, $2.55@2 70; common to good, $2.40@2 50; yellow eyes, $2 20@2 55; red kidneys, $1.60@1.80. Canada peas, 75c@$1.10 ℔ bush. for common to choice; green peas, $1.25@1.70. POTATOES are now dull; we quote Aroostook Rose at 90@95c. ℔ bush.; Maine Central Rose at 80@85c.; Northern Rose at 80@85c., and Peerless at 70@75c. ℔ bush. APPLES at $1@2.50 ℔ bbl. CRANBERRIES at $3@6. ONIONS—Red, $3@3.50; white, $3.75@4 ℔ bbl., and Bermuda $1.50@1.60 ℔ crate.

South Bend Evening Register.

When certain powers are claimed for an article, and everybody testifies that it does more than is claimed for it, to gainsay its worth is useless. This is the substance of the St. Jacobs Oil record.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 7, 1881.

BEANS AND PEAS.—High prices have caused a pause in the bean trade and there are enough weak-kneed holders to quote a decline. Others feel assured that when buyers have to again call for supplies the moderate supply here and in the country will harden rates again. Green peas quiet, with few making $1.55@1.60; Southern B. E. firm at $3.25 ℔ 2-bush. bag.

Medium beans, prime, $2.55@2.60; other, $2.25@2.50; marrow, prime, $2.60@2.65; other, $2.40@2.60; white kidney and pea $2.25@2.55; red kidney, prime, $1.60@1.65, other, $1.40@1.50; black or turtle soup, $1.45@1.50; Lima, $5@5.50 nominal.

BUTTER.—With enlarged supplies of fodder grades the trading has ruled weak. At the close an inquiry from exporters has caused a better feeling, but prices as quoted are full. The home trade too has increased, and if the market is not swamped with supplies a steadier week is looked for. Poor or stale white State or Western soon drops to grease prices. Fine half tubs are having a good ready sale, frequently moving quicker than some of the real and fictitious creamery.

New Butter.—Creamery, choice Western and Pa. 23@24c. other, 20@22c.; sweet cream, 20@22c.; State half tubs, choice, 22c.; fair to prime, 18@20c.; Welsh, choice, 18@20c.; other 17@19c.; very common or stale new 12@16c.; Western imitation creamery 15@20c.; do dairy 15@19c.; factory 12@16c.

Old Butter ranges 10@18c.

Receipts for week 27,350 pkgs.

Exports do. 2,281 do.

CHEESE.—The new have shown a little more freely in the supply and export interest has been stronger; prices on choice stock have been well sustained. Shipments for the week 24,887 boxes. Quotations are for

New at 12¾c. for best; 11@12¼c. for fair and good lots; do. skimmed at 7@8½c, old as follows, fancy at 13½c.; do. fair to prime, 11¾@13c; Ohio factory, good to prime, 11@12c.; do. fair to good, 10@11c.; do. poor to fair, 8@10c. Skimmed creamery, 4@6c.

Receipts for week, 24,029 boxes.

Exports for week, 18 591 boxes.

Liverpool cable, 70s.

Steam to Liverpool, 23s.6d.

COTTON.—The market has been very quiet and showing slight changes only; latest prices are for

May, 10.33@10.34c.; June, 10.43@10.44c.; July, 10.52@10.53c.; August, 10.58c.; September, 10.34@10.35c.; October, 9.99@10c.; November, 9.88@9.89c., December, 9,88@9.89c.; January, 9.97@9.99c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Strict good ordinary	7¾	Middling	9 11-16

Receipts for the week, 18,084 bales, Exports do, 7,9.4 do.

DRIED FRUITS.—Apples have a fair ranging and hold to firm prices. Peaches are in moderate demand. Small fruits are quiet and unchanged. Quotations;

Evaporated apples at 5½@5¾c. for prime and choice stock; sliced apples at 4½@5¾c. for good to choice North Carolina; 4@4½c. for Va. apples, 4@4½c. for Tenn do; 4½@5c. for State do; 4¼@4¾c. for western Ohio and Mich. Peaches at 25@26c. for evaporated peeled; 13½c. for unpeeled do; N. C. peeled at 19@22c.; for the better qualities of new and 12@15c. for old; unpeeled peaches at 5¾@5¾c. for halves and 5½c. for quarters. Plums at 15@16c. Blackberries at 9c. for prime. Cherries at 16c. Raspberries at 24@26c. Whortleberries 11@11¾c.

Receipts for the week, all kinds, 1,700 pkgs.

Exports dried apples, 1,375 pkgs.

EGGS—Receipts for week, 24,081 bbls.; do. last week 14,115 bbls. The market has resumed its usual Spring course when supplies are free; prices are down and buyers can force them to keep near their views with an assured supply.

Near points, 14½c.; State land Pa., 13½@13½c.; Western, 13¾@13½c.; Southern, 12½@12¾c.; poorly packed, and small run 12@13½c.; goose 23@24c. duck, 16@17c.

FLOUR.—The market shows a fair degree of activity and prices closed strong. Shipments for the week 1,936 bbls. and 46,200 bags.

Latest prices are: $4.75@4.50 for very inferior to strictly fancy superfine State and Western; $4.40@4.60 for poor to choice extra State and Western, odd lots and lines; $4 60@4 75 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4.50@5.50; good to choice do. at $5.50@6.35; (very choice up to $6.50 and fancy at $6.75;) red and amber winter wheat inferior to choice trade and family at $4.50@6.15; round hoop Ohio, $4.50@4 85; and trade and family brands of do. at $5.00@6.25, the latter for very choice; St. Louis $4.75@5.65 for inferior to good extra, $5.65@6.50 for good to very choice, and up to $6.65@7.00 for very fancy brands; Minn. clear, inferior to very choice at $4.40@5.75; Minnesota "straight," poor to very choice, at $5 35@6.75, and patent inferior to fancy at $5.75@8.00; city mill extra at $5.55@6.70 for the West Indies; do. for England at $4.40@4.75 for poor to choice spring wheat; do. trade and family extras $5.70@6.75; do. for South America, $5.75@6.00, the latter for very choice; No. 2 at $3 00@5.55 for very poor to very fancy.

Receipts for week, flour, bbls. 93,000; corn meal, do. 5,314; wheat, bush., 712,575. corn, do. 524,700; oats do. 173,700; rye, do 4,020; malt, do. 37,750; barley, do. 32,300; beans, do., 5,152; rice, pkgs. 1,145.

Exports for week, flour, bbls. 68,200; corn meal, do. 4 500; wheat, bush. 917,700; corn, do. 491,500; oats, do. 3,550; peas, do. 2,501; beans, pkgs. 1,353; rice do. 1,117.

CORN MEAL—Sales at $3,25@3.30 for Brandywine and $2.75@3.25 for yellow Western.

FRESH FRUITS.—A few choice apples go abroad as freights are low and the risk is small; exports for week, 1,300 bbls.; specially saved lots are firm but ordinary orchard packings are irregular. Prime stock, $2@2.25@2.10; common to fair, $1@1.50; other from 75c. indefinitely downward. Cranberries have scarcely any sale; fresh rhubarb helps to put them aside; N. J. crates, 75c.@$1.50 as to hardness. Strawberries turn out fine and sell briskly; quoted 35@40c., mostly clear stock. Hot-house grapes—Black Hamburgs, $2 ℔ lb. Peanuts have a fair sale at firm prices; Va. hand-picked 4½@4¾c.; other, 3¾@4¼c; shelled, 3@3¾c; pecans 7@8c.

GRAIN.—Wheat has been active and closed higher; exports for the week have been 800,000 bush.; latest prices are for

No. 1 white at $1.26@1.27¼ do. May at $1.22½@1.23¼; do. June at $1 20¼@1.20½; do. steamer grade at $1.21@1.21½; No. 2 white at $1.24½@1.25; ungraded white at $1.20½@1.26; mixed Winter at $1.25@1.26¼; No. 2 red at $1.29@1.29½; do. May at $1.25@1.26; do. do. June at $1.22½@1.23¾; do. July at $1.20@1.20½; do. August at $1.15½@1.16; do. steamer grade at $1.26; No. 3 red at $1.24½; ungraded red at $1.18@1.28; No. 2 Chicago and Milwaukee Spring at $1.26@1.27; N. Y. No. 2 Spring at $1.23; No. 3 Milwaukee Spring at $1.19½.

Rye at $1.09@1.11.

Oats are being taken freely at strong prices; latest sales are of

No. 1 white at 55c.; New York No. 2 white at 52@53c.; No. 3 white at 50c.; New York No. 2 at 46½c.; do. May at 46½@46¾c.; do. June at 46½@46¾c.; do. July at 46¾c.; No. 3 at 46@46¼c.; ungraded white Western at 47@55c.; ungraded mixed Western at 46@47½c.; No. 2 Chicago at 47c.

Corn is in liberal demand and firm at higher prices; latest prices are for

New York No. 2 at 61½@62c.; do May at 57¼@57½c.; do. June at 55¾@56c.; do. July at 56@56½c.; No. 3 at 58¾@59½c.; ungraded mixed Western at 58@63c; New York steamer mixed at 60½@62c.; No. 2 white at 64@65c; white Southern at 64c, New York yellow at 63@64c.; steamer yellow at 60½@62c.; yellow Southern at 63c; low mixed at 62c.

HAY AND STRAW.—Retailing grades of hay are in small receipt, fair demand and firm in price; other qualities are plenty and freely offered. Straw is selling well. Quotations are for

Prime timothy hay at $1.10@1.15 ℔ 100 lbs.; medium timothy at 95c.@$1.00 do.; shipping grades at 85@90c. do.; clover mixed at 95c.@$1.00, clover at 80@85c. do. Straw—No. 1 rye at $1.05@1.10 ℔ 100 lbs.; No. 2 rye at 65@70c, do.; oat and wheat at 45@55c. do.

Exports for week, 2,215 bales.

HOPS.—Export demand continues slack and the demand from brewers moderate; but prices are held steady. Quotations are for

	Cents per lb.
New Yorks, crop 1880, choice	22 @23
Do. medium	19 @20
New Yorks, crop 1880, low to fair	12 @15
Eastern, crop 1880	14 @22
Wisconsin, crop 1880	14 @22
Yearlings, crop 1879, choice	12 @18
Olds, all growths	4 @10
Pacific coast, new	19 @23
Bavarians	30 @35

Receipts for week, 882 bales.

MAPLE SUGAR.—The demand is moderate but likely to use up the crops. Sugar 7@10c.; syrup 10@11 lbs. to gallon, 75c.@$1 in can.

POULTRY AND GAME.—Prices are high for dressed but supplies merely fill a special class of trade at this season. Spring chickens are very scarce. Coarse fowls are as low as 10c.

Turkeys, prime fresh and frozen 18@19c.; good 16@18c.; large coarse 13@14c; chickens Spring 75c@$1; Winter 60@75c; Winter, 30@75c, Fall 20@24c; fowls, d. p. 13@14c.; scalded 12@13c. Capons, large, 32@33c.; small 28@30c. Ducks, choice 23c.; other, 16@20c. Squabs, white, $4 ℔ doz.; do. dark, $2.

The market is weak for cooped stock; everything lower.

Fowls, 10@12c.; roosters, 7@8c.; turkeys, 12@13c.; Spring chicks per pair, $1.25@1.50; ducks, 60c.@$1.00; geese, 75c@$1.75; pigeons, 35@50c.

Game is small in offering; pigeons wanted. Eng. snipe $2.25@2.50 per doz; plover $2@2.25; sand snipe 50@60c; wild squab $2.25@2.50.

PROVISIONS.—Hog products have been in good demand and strong in price.

Mess pork closed at $16@16¼ for old and $17.75 for new, with May at $17.75; June at $17.75@17.85, Bacon at 9c. for long clear and 9½c. for short clear. Lard—Western steam at 11.55 for spot 11 10 for May, 11.50 for June, 11.52½ for July, and 11.52½ for August. Stearine at 13¾@13¾. Tallow at 6 5-16@6 9-16. Beef hams at $22.50@23. Beef for extra India mess, at $22@23.25 for city. $11.50@12 for extra mess; nominal for plain mess; packet at $12@13.

Receipts for week, beef, bbls and tcs, 1,100; pork, bbls. 1,300; cut-meats, pkgs. 13 300; lard do. 11,400.

Exports for week, beef bbls and tcs., 1 800 pork, do. 4,500; cut-meats, lbs. 4,346,080; lard, do. 1,5 9,900.

SEED.—Clover is quiet at 8¾@9c. for Western. Timothy is firm at $2.90@3.

TOBACCO.—Export demand is firm and the home trade good, with prices firm.

VEGETABLES.—Potatoes are in better demand and prime sorts favor the seller.

Bermuda potatoes $7@9 ℔ bbl.; Florida, $4@7; Early Rose, Nova Scotia d. h. $2 87@3 00. Maine $2.75@2.87; State, $2 50; do. bulk, $2.37@2 60. Prolific, $2.25@2.50; Mercer, $2@2 25 Jackson White, d.-h., $2.12@2.37; Burbank, d.-h. $2.50@2.62; do. bulk, $2 50@2.62; Snowflake, $2; do. d.-h. $2.50, peach-blow do. $2.75@2.87; Peerless, $2@2.25; sweet Del. $1 50@2.50.

Green stuff is of very irregular quality and only useful packages are quoted. Demand improving. Some extreme Southern items are giving place to nearer rates.

Florida cucumbers, per crate $4@5; North Carolina green peas, per ½ bbl. $3; Savannah do. 50c.@$1.25; Charleston do. 50c@$1; do. tomatoes, $2@3.50; Bermuda do. boxes, 75c@$1; Fla. squashes ℔ crate $1@1.25; cauliflower do. $1@4 ℔ bbl.; cabbages $1@4; Fla. beets $1.50@2 ℔ crate; Bermuda onions, $1@1.12 ℔ crate; Fla carrots $3 50@4 ℔ 100 bunches W. turnips, N. C. $3@4; do. radishes, 25@50c. ℔ 100 bunches; asparagus, Oyster Bay, $4@4.50 ℔ doz.; other, $1@3; rhubarb, L. I. $1.75@2 ℔ 100 bunches; old turnips 50@75c. ℔ bbl.; beets 75c @$1; Hubbard and marrow squash, $1.25@1.50 ℔ bbl.; carrots, $1@1.75; onions, red, $1@1.50. Hot-house mushrooms $1 ℔ lb.; lettuce $2@2.50 ℔ bbl.; radishes $1.50@2 ℔ 100 bunches; cucumbers $1@2.25 ℔ doz.

WOOL.—Trading has been very dull again the past week and prices unsettled and easy. Quotations are for

WASHED FLEECE.

LIVE STOCK MARKETS.

NEW YORK, Saturday, May 7, 1881.

BEEVES.—Receipts for the week 10,997 head; do. last week 12 621 do. The offerings have been light throughout the week and sellers have made the most of it. The market was one of the quickest of the season. The stock trains did not reach the Jersey City yards until 7 a.m., and in less than two hours every bullock was sold; at 50th St. a full clearance was made before 7 a.m. Prices were rated ½@¾c. higher than Wednesday and ¼@1¼c. higher than last Monday, and at the advanced rates there was not enough stock offering to go round. No cattle sold below 10¼c. to dress 56 lb., less 50c. per head, and two car loads of choice Illinois steers went at 12½c. to dress 58 lb; the bulk of the sales were at 11@12c., to dress 56@57 lb. Yesterday dressed beef sold mainly at 8@9½c.; to-day 9½@10c. were the leading prices, and an active market was reported. Exporters were not operating, prices being too high.

COWS AND CALVES.—No variation to note. Really good cows depend upon private sale at this season, when farmers can utilize new milk.

VEAL CALVES.—A very light trade was reported, but the feeling was firm and yesterday's prices were fully maintained. Grassers are quoted at 3½@3¾c.; mixed lots at 4@4½c., and common to choice veals at 5@6c.; few selections reach 6¼@6¾c. There has been a good dressed calf market all the week; to-day country dressed were selling mainly at 7@9c., few up to 9½c.

SWINE.—Receipts for the week, 28,320 head; do. last week, 28,016 do. Market firm for live hogs at $6.20@6.50 ℔ 100 lbs. City dressed State 7¾@9c.; do. Western 8¼c.

SHEEP AND LAMBS.—Market steady with small supplies. Poor to good clipped were sold at 4½@5¾c; two loads of unshorn do. at $6.75@6 80; clipped yearlings at $7, and a number of Spring lambs at $8@9.25 each.

The New Bible.
QUICK WORK
As previously announced, we propose fully to meet the demands of the great army of friends of the Literary Revolution for the new version of the New Testament, which is now promised positively by the English publishers on the 17th of May. Our printers will put the entire work into type inside of a few hours from the time a copy can be procured, and we shall manufacture at least 10,000 copies a day until the demand for it is met.

IN CHAINS!
A few centuries ago the few Bibles in existence were commonly chained in the churches and accessible only to a few. Those who attempted to free them, translate them, and give them to the people, had the stake and the scaffold for their reward. This new version of the Testament was completed, printed, and bound months ago in England, but that the English publishers might be able to monopolize its sale, and make a few hundred thousand dollars the more, it has been withheld from the public. The Copyright Law in England is such that at least two newspapers, which, by some method, secured copies of portions of it, and published extracts, with comments, were compelled to desist from repetition of the "crime," and to publicly apologize for their "wrong." We are in favor of an equitable international copyright law that will give authors due reward for their labor, but Americans will not care to see such an English law transferred to this country.
On May 17th these monopolists promise to unbind the "chains" and release probably a million testaments to the world. They promise one edition in very small type in paper covers at 15 cents per copy.
We propose to give with speed never before equaled in the history of publishing, in type of nearly double the size used by them, the New Testament complete for 10 cents, the Four Gospels complete for 7 cents, the Gospels separately, each for 2 cents; and in many various forms and styles up to full Turkey morocco, gilt edges, for the new and old versions on pages facing for $1.50.

GOOD WORK,
Remembering the past, our friends will not be surprised that the publishers and booksellers who do not like the Literary Revolution are slandering in advance our editions of this work, pretending that there will be many errors, resulting from its hasty production. In reply, we can only promise to those who have trusted us, and have not found us wanting, that it shall be, typographically, one of the most accurate works ever printed on this Continent. The printing house of S. W. Green's Son, Nos. 74 & 76 Beekman Street, which will do the work, has no superior in this country in the character of its workmen, and equal in its ability to do good work quickly. They will take double pains to do the best work possible, as this will be, for their reputation, the most important work they have ever printed, and following them, our own proof readers and critical scholars engaged on our Encyclopedia will all unite to make the work absolutely free from error.

A FREE GOSPEL.
Furthermore, to demonstrate the superior quality of our work, we propose to send, post-paid, free, to the name of any person applying, by letter or postal card, a complete, beautifully-printed copy of the Gospel of St. John. Only a single copy will be sent to any applicant. We propose to print, if called for, a million copies for gratuitous distribution. Persons who would like this specimen in quantity, for distribution, will be supplied for the price of 50 cents per 100 copies, or at that rate for a larger number.

BIBLES IN 200 STYLES.
The religious public will be glad to know that about July 1st we shall be prepared to offer them the largest and most complete variety of Testaments and Bibles ever sold in this country, ranging from the smallest Testament to most elaborate Teachers' Bibles and the largest Family and Pulpit Bibles at prices from 2 cents for a single Gospel to $25 for the largest and best quarto Bibles with illustrations and commentary. The prices for all of them will be proportionately low with our other incomparably cheap standard publications. Full particulars, with specimens of the typography will be ready soon, and will be sent free upon publication.

Young's Great Bible Concordance.
Our new edition of this magnificent work, which may fairly be called the "Webster's Unabridged of Religious Literature," is now ready. By its aid the unlearned English reader is given ready access to the information heretofore accessible only to those learned in the Hebrew and Greek languages, or by the aid of expensive and often inaccessible Greek and Hebrew Lexicons and Concordances. In connection with the new version of the Bible, particularly, it proves especially interesting and helpful, giving what no other work supplies, clues to the considerations which have led scholars to make the varying translations which have been given to the world in the centuries past, enabling the intelligent reader in large measure to decide for himself what is the meaning that will best satisfy his own understanding and the demands of his own conscience. Specimen pages sent free on request. Price $2.25, postage 37 cents.

5,000 Booksellers
throughout the United States and Canada are prepared to either abundantly supply, or liberally slander our publications. We give liberal Terms to Clubs where no bookseller acts as agent. Descriptive Catalogue, and illustrated pamphlet describing book-making and type-setting by steam, will be sent free, on request.

Reading for the Young.

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

ALICE P. ADAMS.

The Citrus Fair—Continued.

The most conspicuous feature of the exhibit from Pasadena (a thriving colony in Southern California) was a huge tent-like structure composed of boxes of oranges—one hundred and forty-four in number—and decorated with evergreens, roses and callas. On the adjacent tables many varieties of oranges and lemons were displayed, among them a Konah orange which measured sixteen inches in circumference.

"Oh, see those strawberries!" exclaimed Daisy, pointing to a large case filled with boxes of the Monarch of the West.

"That is nothing," said Violet. "Our vines are full of green berries now. Last year we had plenty of them ripe before this time; but for some reason they seem to be later this Spring."

"What are those?" inquired Daisy, pointing to an odd-looking bunch of green.

"Bananas," replied Bertram. "But they are not ripe. Didn't you ever see a picture of a banana tree with a negro standing beside it? There was one in my old geography, and I used to think the trees and the long bunch of fruit must be very wonderful, but you can see them here any day."

"If you go where they grow," added Violet.

"That is understood, of course. Now girls, don't stop to look at these flowers. I'll show you the prettiest thing in the whole Pasadena collection. There," as they obediently walked along, "what do you say to that?"

"That" proved to be a boat about two feet in length, made of flowers. The hull was composed of variously colored rosebuds, heliotrope and smilax; while the sails were fashioned from the same graceful vine interspersed with white flowers—laurestinus, spiræa, rosebuds, orange blossoms, and the most delicate little pinks; and above all floated a small flag inscribed PASADENA.

"How I wish mother could see that!" said Daisy, for the twentieth time since she entered the building. "I imagine she would be as disgusted with her house-plants as I am."

On the table from Orange they found a fine display of citrus fruits, including another orange that measured sixteen inches. Some of these oranges were wrapped in tissue paper on which was printed the name of the owner's grove, and underneath—"Each orange is warranted sweet and juicy."

"Why are some of these wrapped in paper?" inquired Daisy.

"To make them sell better," laughed Bertram. "I remember when we first came to the State, father bought some oranges that had some such inscription, and I declare if they were not as sour as I ever tasted."

Scattered about the table were views of one of the finest groves in the prosperous settlement of Orange. Boxes of raisins were displayed, as also were many beautiful flowers—some handsome leaves of the Madame Pollock Geranium being especially deserving of praise. But the greatest curiosity to Daisy was some twigs of the Australian Saucer peach, on which some of the thickly-set young fruit were as large as hickory nuts, though picked before the middle of March.

At the Santa Barbara table they found luscious canned fruits, walnuts, almonds, and views of the old Spanish Mission. Here also they saw the custard apple—a queer, brown, scaly-looking fruit that did not ripen till summer, and had been picked three weeks—so it did not look very inviting.

On the San Diego table were arranged a number of bottles of pickled olives in addition to the fine display of citrus fruits.

"Oh Violet, stop and see these beautiful shells!" exclaimed Daisy as they were passing some cases containing fancy articles. The gentlemanly attendant noting the girls' interest told them the names of the various shells, which were all found on the Southern California coast. Some were very handsome, particularly the rainbow and pearl *abalones*. Then there were walking sticks of native woods; and lovely pampas plumes packed ready for mailing to Eastern friends; and sleeve-buttons of orange, lemon, manzanita, acacia, pepper, and other woods with which all Californians are familiar. Daisy wanted to buy a pair for her father, and wavered some time between the orange and manzanita, but finally decided in favor of the orange.

Across the building was another display of fancy goods, and here they found jewelry made from the lustrous *abalone* shells, set in silver and gold. There was a hand mirror with a shell frame and a lily in mosaic on the back. "*Only* twenty-five dollars," said Bertram when Violet wondered how much it cost. Then there were crosses and picture frames from the same shining *abalone*, and paintings on large round shells from the Tahiti Islands—among them a familiar San Gabriel view. At this table Daisy invested in *abalone* pins in the form of a dagger and bird to send to her mother and sister.

After they started on their homeward journey late in the afternoon Mr. Erman asked Daisy what she thought of the fair.

"I don't believe I ever had a pleasanter day in my life; and if father had seen what I have to-day I know he would want to try his hand at growing fine oranges."

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—As I have seen but few letters from old members lately, I concluded I would write. I would like to awake the cousins to a fact. Spring is here. The crocuses and hyacinths are shooting into the light, robbins are hopping merrily around, grass is growing green, and Spring rains have melted nearly all the snow from the ground. We have all had Winter enough. The snow has not entirely disappeared here since the first of November. Well, cousins, I hope this Summer will be a favorable one for us in many respects, but we ought to bear our disappointments as cheerfully as others. I know it is hard to see the few little plants, rare to us, perhaps, choked by the drouth or destroyed by the bugs. I, for one, am going to do more this year. Settle down and work. It would be nice for each one of us to have some specialty. Raising new plants from seed, or perfecting ourselves in some branch of horticulture. But that is an old worn-out saying. We all have heard it fifty times or more. How many of you are intending to make a Japanese quilt like the one spoken of in the RURAL? Its very irregularity has a charm for me. I could almost imagine, by looking at home, that I was advising the handiwork of some far-off "Jap." But I shall tire our good Uncle's patience, so for the present, adieu. MINNIE S. WHITE.

Alden, Erie Co., N. Y.

UNCLE MARK:—This has been a long, cold Winter, and if snow falls this month it will be seven months of snow. The weather kept so cold that the snow melted away very slowly; only in the middle of the day could we see any change upon our high banks until April 1st. There was one on the west side of our house that was up to the top of the window. It looked then as though there would be snow there in June. We received the package of seeds you sent, and also the White Elephant Potato. We thank you very much. I am very impatient to have the weather get warm and the garden made, so I can get the seeds in and see things beginning to grow. I start my seeds in a hot bed and then transplant the little plants. In this way I have very good success and have early flowers, and nice, early vegetables. From your niece, CLARA.

Oneida, Co., N. Y.

Quiet nerves and Balmy Sleep in Hop Bitters for sleepless Ladies and Invalids.

New Publications.

"FOR ORGANISTS."

ORGAN GEMS. ($2 50) By F. L. DAVENPORT.
ORGAN SELECTIONS. ($1.50) By PETERS.
BATISTE'S ORGAN VOLUNTARIES. $2.50.
BATISTE'S LAST COMPOSITIONS. $2.50.
ORGANIST'S RELIANCE. (10 Nos., each $1.25. Complete, $6.) By EUGENE THAYER.
ZUNDEL'S ORIGINAL ORGAN COMPOSITIONS. ($1.25.)

In these six well-made books will be found a very large number of voluntaries, some classical some new and light, but all good. Organists will be glad to use the longer ones intact, and to adopt the shorter compositions as themes from which to vary.

Billee Taylor, price reduced to 20cents.
Olivette, price reduced to 50 cents.

Johnson's New Method for Harmony.

($1.00.) By A. N. JOHNSON. "The best book in the world" (for its object), was the commendation bestowed by an enthusiastic pupil on a former book by the same author. However that may be, this is his newest treatise, and can hardly be excelled for plainness of explanation, ease and thoroughness. It does not attempt Counterpoint, or any of the higher problems of composition; but confines itself to those things that every organist, every good player, and every composer of "the people's music," ought to know.

PERSONAL ITEMS.

Gen. Joseph Lane whose death last week in Oregon was chronicled by a line in the dispatches, was a candidate for the Vice-Presidency in 1860, on the ticket headed by Breckenridge and nominated at Baltimore, a senator from Oregon from 1859 to 1861, governor of the State in 1863, and a major-general in the Mexican war.

Mr. Walkins is a Sacremento artist. His most ambitious painting, a landscape with cows, was sold at auction for $530, and he was elated at the price. The purchaser was the proprietor of a dairy farm, and he placed the picture in his window with a sign painted on each of the picturesque cows: "Morgan's pure milk producer." The artist sought to stop this use of his work, but was advised that the present owner could do as he pleased with it.

As a test of the personal concern which members of the British Government have in land laws, we may note the possessions of some of them. Mr. Gladstone is the possessor of 7,000 acres: the Marquis of Hartington is heir to 200,000 acres; Earl Spencer owns 27,000; Earl Kimberley, 11,000; Lord Northbrook, 10,000; Mr. Dodson, 30,000; Lord Huntley, 30,000; other members have lesser estates, and Mr. Bright is the only prominent man in the Cabinet who has no landed possessions in fee worth mentioning. The Duke of Argyl, who has retired, owns 175,000 acres, but his rental is a little more than a fourth of the Duke of Devonshire's.

[Battle Creek. (Mich.) Daily Journal.

Upon being spoken to concerning St. Jacobs Oil, our fellow townsman Mr. Theodore Wakelee, said: I had been suffering with rheumatism, and obtained the greatest relief from the use of St. Jacobs Oil. It has already been used in my family for some time, and has never been found to fail in giving prompt relief.

Nature's Cathartic.

No medicine is needed to keep the bowels in order as long as nature's cathartic, the bile, flows freely and regularly from its source in the liver, and is of the right strength and quality. But the great biliary gland is easily disordered, and the consequences of its irregularities are serious. To bring it back to its natural condition when thus affected, Hostetter's Stomach Bitters should be taken at least twice a day until the desired object is attained. Constipation is due to a scant supply of bile, or to a lack of the stimulating element in that fluid. In either case mere purgation is useless. The liver must be compelled to yield the supply of bile necessary to remove the waste matter from the system at least once in twenty-four hours, before a radical cure of costiveness can be accomplished. Hostetter's Bitters produce this effect. Its action upon the stomach and liver is direct on salutary, and through these organs it regulates and invigorates the whole frame.

THE RURAL NEW-YORKER

Ralph Evans

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XL.—No. 1634.} NEW YORK, MAY 21, 1881. {PRICE FIVE CENTS $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Farm Economy.

NOTES FROM THE RURAL FARM.

As we pen these notes, a gentle steady rain is falling to gladden the hearts of farmers. It was much needed. Oats, owing to the backward season were sown late; the ground was dry, so that their germination was so slow as to endanger the prospects of even a fair crop had the dry weather continued a week longer. The grass crop too—so sensitive at this season to drought—is now receiving all the rain that is needed. Our present experiments with oats will give us a fine opportunity of judging of the advantages or disadvantages of thick or thin seeding. Some plots received but three-quarters of a bushel of seed per acre—others as high as three bushels. But this is a question that must ever rest upon the fertility or poverty of the soil, its mechanical character, the kind of manure used whether farm or commercial fertilizers, moisture, drainage, etc. If we could have a soil in every way adapted to oats and could control the seasons, no doubt less than a bushel of seed to the acre would serve. As, however, unfavorable conditions are encountered, we must make up by thicker seeding what is hazarded thereby.

How easy it is for even the best of farmers to arrive at wrong conclusions! A new method or implement tried one season under conditions specially favorable to its success, is very likely to induce an undue valuation of that method or implement until by a disastrous failure, or so, its real worth is ascertained.

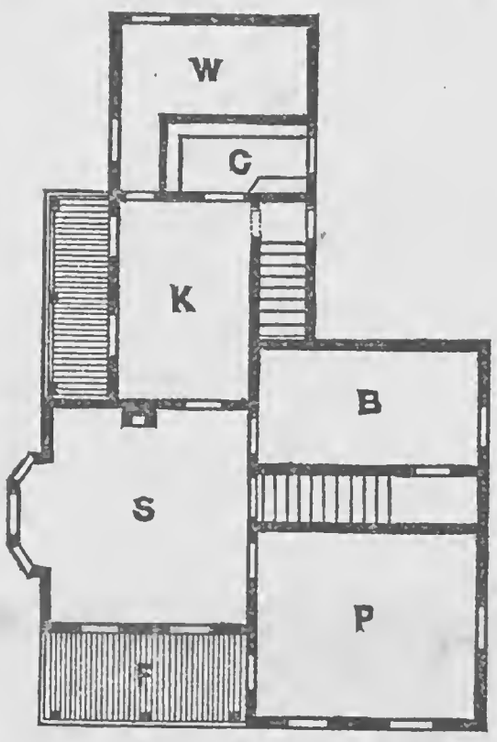
The roller is with us a very valuable implement on certain fields and during dry weather. To harrow, roll and harrow a dry field will effect a finer pulverization of the soil than any number of harrowings alone. Again, a sandy soil may be advantageously rolled, if dry, after sowing. The soil and seed are thus brought into contact or closer contact, and a speedier if not a surer germination is the consequence. But if the soil is adhesive or wet, or even moist, then the roller, we think, would do more harm than good.

The surface is compacted—cemented as might almost be said. The access of air is less free; rain instead of passing through it readily, is retained upon the surface long enough still further to glue the particles together, as it were, and to present a surface which is soon baked and hardened by the sun's rays.

The severity of the past Winter has well tested the endurance of our many kinds of wheat, not only as regards their power to resist mere cold, but which are best adapted to light or sandy soils, which to lowlands, which to poorly drained land. Indeed, the information already obtained has repaid us for the time and labor which the experiments have involved. This subject, however, will prove more acceptable to our readers if considered later.

FAST PLOWING, OR FAITHFUL.

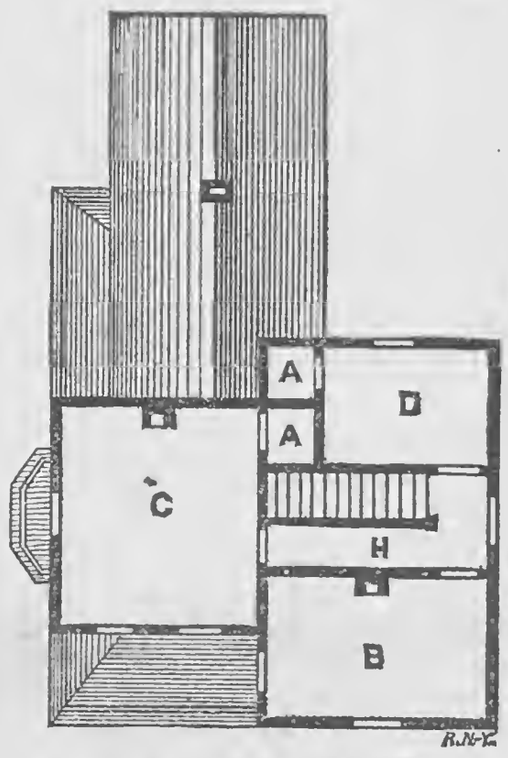
All day long have I followed the plow, watching each furrow turn with assiduous care, and on stony places backing my team whenever the plow, striking a stone, got the advantage of me, now and then loosening a large one and lifting it to the top of the furrow. Although the field is only 30 or 40 rods long, I cannot readily urge my team to take a furrow across without stopping once—I never carry a whip. I say this to draw attention to the amount of soil they are turning in the furrow, which is about a cubic foot to the foot,



GROUND PLAN OF COTTAGE.—FIG. 253.

actually nine or ten inches deep and thirteen wide. The plow throws up now and then the yellow soil at the bottom of the furrow, which in this land is of the same consistency as the upper soil for at least a foot—gravelly loam. The team I am using is one of common size, and, of course, the horses are doing nearly their utmost and require very great care, and not the least attention is given to their breasts and collars to prevent galling. The team which my man is using is a heavy one, but the horses are already galled, though they walk faster and do more work.

I write the above thus to indicate some particulars of our work. It gives me pleasure to look back on my furrow and see the soil reefed up true and slick, and the apex of each furrow slice even with the top of the rest—an achievement the make of plows of to-day can so readily accomplish if rightly rigged and operated. What a grand improvement on the plow in use when I began plowing 10 years ago! The finest sight of all in plowing, to my fancy, is where the furrows are all smooth and give a



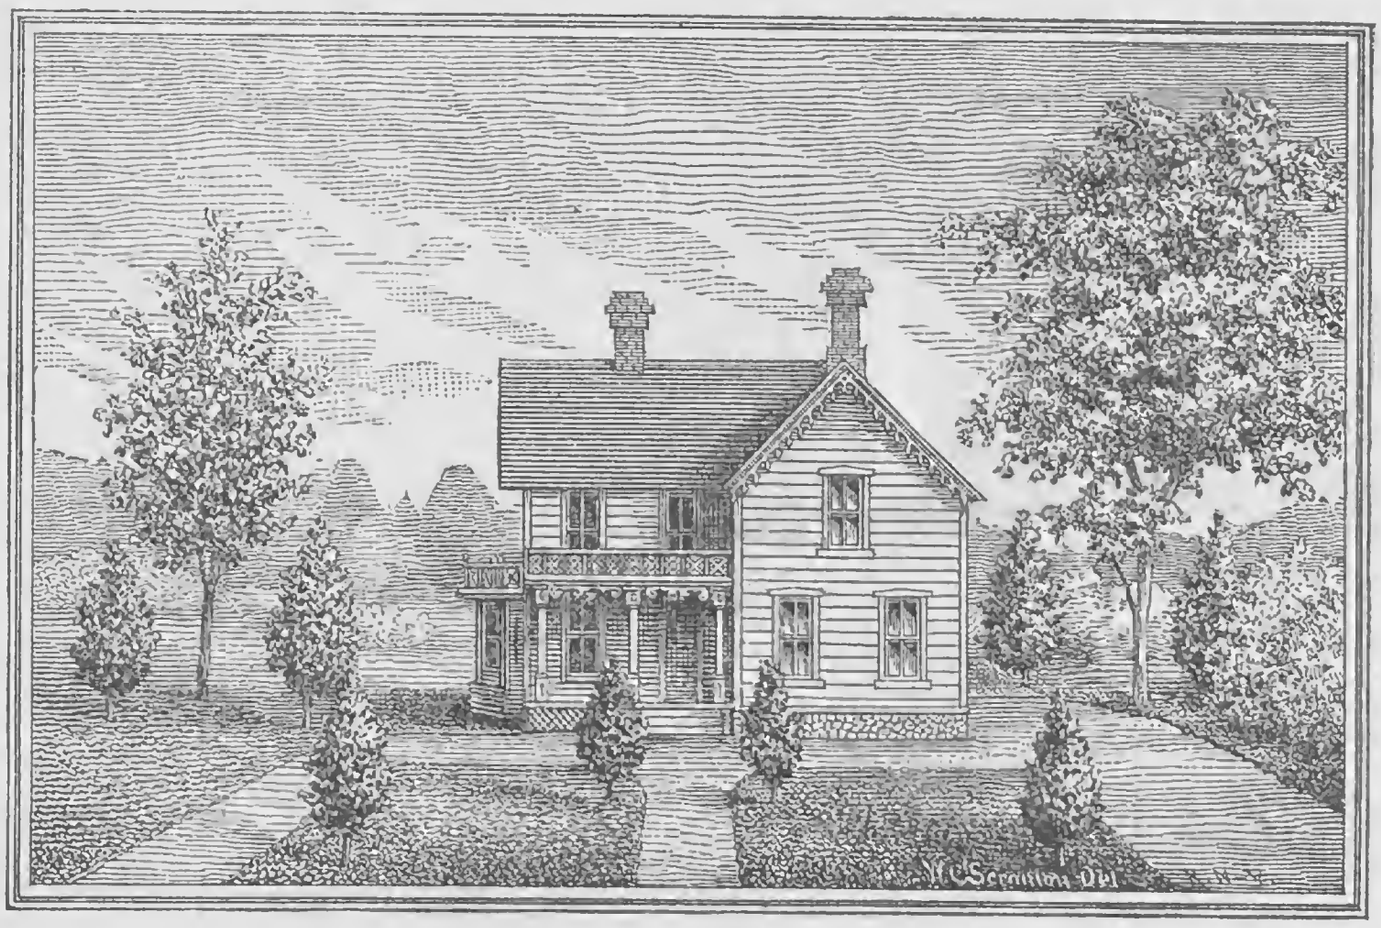
SECOND STORY OF COTTAGE.—FIG. 254.

very regular appearance, and yet the ground is dotted here and there by large stones and small bowlders which the plowman has lifted to the surface. In doing the above plowing I would not expect to get over more than one acre per day. If a workman on our farm should report plowing two acres per day, I should feel like inspecting it at once.

Imagine my surprise, then, when a neighbor, on his way to town towards sun-down, stopped at my field and stated that he was doing railroad business at plowing, turning over "mighty close on three acres per team per day." Two teams plowed 13½ acres from Monday morning, April 18th, to four o'clock p. m. the following Wednesday, each day drawing a lumber wagon two miles and back, and, on deducting one hour and a-half for nooning, making about nine hours of plowing per day, or 25 hours for the 13½ acres. I am generally too busy to examine my neighbors' plowing closely, but as soon as I could I turned inspector of fast plowing, and tramped that farm over, and although I did not get all around before twilight, I can say that, in my judgment, it was awful. The 13½ acres were corn stubble, undragged before plowing; level ground, gravelly, and in one part clayey, without any stones. But the plowed lot presented the appearance of a billowy sea; every little while a long channel extended at places nearly across the lot, and here there would be space of a foot, or even two feet, from the apex of one ridge or furrow slice to that of the next, and here and there I saw a curved pit making a depression about the size and depth of the place in which the rower is seated in a fine race boat. One of these ridges I scraped off and found a narrow ridge of the surface soil which had not been cut and turned by the plow. The dead furrows were not filled up by turning back three or four furrows. In brief, the plowmen had been taking enormously wide and shallow furrows in corn stubble. Now, this cannot be done nearly as well as in clover sod or even wheat stubble. On passing into the next field I found the plows in the furrow. The plowing appeared pretty good here in wheat stubble; but on stepping into the furrow and walking along, I found it would hardly average ankle-deep—no galled horses here. On an adjoining hillside the plowing gave evidence of some of those mammoth furrows which can so readily be rolled down in such a place. After tumbling about in the furrows a little longer in the fast-receding twilight, I decamped with many remarks made to myself.

Now is this fast kind of business—which some of our excellent modern tools assist very much in doing—ideal farming? Are we all to be classed together as farmers, or is there a soil-loving class, called agriculturists, who do not seek to hurry through and get done, to "go a-fishing" or to "take it easier," but who expect never to get through, and, indeed, never want to, only in so far as to attend to each crop in its season, who have no choice of work so long as it appertains to the growth and care of crops or farm improvements?

After all, does the extra labor pay in extra crops, above all extra connected costs? That neighbor of mine, whose plowing was so careless, raises good crops, and no year passes without his boasting on something. Comparatively little money is expended on his crops. He will drill the above field after harrowing but once. Of course, it is not probable he would change these methods unless he could see that excellent tillage gave nearly double the yield, and then it would be almost impossible to convince him that the RURAL, or any other agricultural paper, is a useful journal. AGRICOLA.



ELEVATION OF COTTAGE.—Fig. 255.

BLOWING OUT STUMPS.—L. S. writes us from Clinton Co., Michigan, that he has just cleaned one of his fields of a lot of stumps that has been an eyesore and an annoyance. For the purpose he used dynamite cartridges put up in waterproof oiled muslin, much like a candle in appearance. With a crowbar he bored a hole under the stump, inserted a piece of cartridge about an inch in diameter and from two to four inches long, according to the size of the stump, exploded it by means of a percussion cap inserted in one end, and the stump was blown out, often in fragments.

Rural Architecture.

A SMALL, CONVENIENT HOUSE.

THE accompanying plan of a neat and convenient house suitable for a small family, was sent us by A. B. T., whose address has, unfortunately, been mislaid. The plan is so clear and simple that it can be readily understood and followed by any one without much explanation. The parlor, P, is 14x16 feet, with one door opening into the porch, F, and another, into the sitting-room, S, which is 14x16 feet. Off it is a large bed-room, B, 8x16 feet, which has a closet under the stairs. Back of the sitting-room is the kitchen, K, 10x14 feet, to the rear of which is the pantry, C, 5x10 feet, from which stairs descend to the cellar, and behind all is the wood-room, W, 7x14 feet.

On the second floor there are two bed-rooms —B, 10x16, and D, 8x14 feet; the chamber, C, 14x16; the closets, A and A, and the hall, H.

AN OHIO CREAMERY.

THE admirable dairy articles furnished to the RURAL by Henry Stewart, find in me an interested reader, and having written an article or two myself for the press upon similar topics, I ask for permission to furnish my model creamery plan, a creamery, in fact, in operation, and, so far as I know, the largest in the world, consuming, as it does, over 30,000 pounds of milk per day, when it can be obtained. Originally the creamery was a full stock cheese factory, but three years ago it was turned into a creamery, though flat, white cheeses of very superior quality are made from the "denuded" milk.

By reference to the accompanying plan, an idea can be readily obtained of its characteristics and the handiness and dispatch with which the labor can be performed. The water is very abundant, that from three large Springs being conveyed into the buildings, while the butter house, F., has a Spring of very cold water within the building. The curing house and milk house are 30x40, and 30x90 respectively, the curing house being two stories in hight. The floors of the milk house are built crowning upon an independent foundation, so as to allow an inch gutter to be cut in the floor entirely around the room, rendering slops upon the floor impossible.

The manner of making both butter and cheese does not differ probably from that followed in any well regulated creamery. The cream, when removed, is put in ten-gallon cans, and set in the the tank, *h*, which is supplied with its own spring, the water being at a temperature of 51°. The churn is of the barrel description, revolving end-over-end. The butter-room is a double-walled building, the inner wall of stone, plastered upon the inside; the outer wall of battened boarding. The proprietor, Mr. Frank Hurd, is a veteran in the business, having, in 1864, erected the first factory in Ohio, that from the first purchased the milk—a plan he has always adhered to, and now his example is followed by a great number of the largest creameries and cheese factories in the State.

GROUND PLAN.—A, milk-room; B, press-room; C, cream-room; D, curing-house; E, engine-house; F, butter-house; G, ice-house: *h*, cream-tank; *i*, churn; *k*, engine for churning; *l*, platform for receiving and weighing milk; *m*, covered drive-way for dump; *n*, milk vats; *p*, presses. J. G.

Aurora, Ohio.

Field Crops.

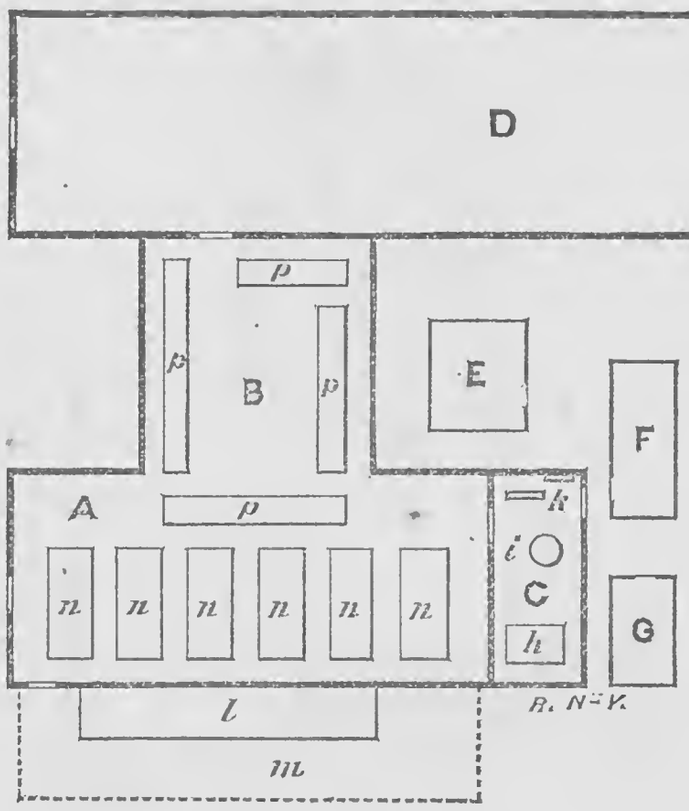
TOBACCO CULTURE.—NO. 10.

G. A. GOFF, JR.

Packing the Tobacco.

IF the tobacco is in good condition when it is assorted, that is, if it is neither too dry nor too damp, and the butts of the leaves are dry, it may be packed immediately. If this is not the case, the first step is to put it in the required condition. If the butt, or stem, ends are soft and clammy, as they frequently are, the "hands" should be packed up in an open "rank" with the butts exposed to the air, and there left until they are sufficiently dry to go into the case. This condition is best brought about by placing guide boards against which the butts of the "hands "are placed while they are being packed; or, in other words, pack the tobacco temporarily in a box with movable sides as far apart as those of the case in which it is to be finally packed, and—in arranging the tobacco in it—set the butts against the sides, which must be removed when the box is full, leaving the butts of the leaves exposed to the dry air. The top and ends of the rank should, of course, be well covered. Care should be exercised in this work to keep the leaves straight, for, if once doubled up, it is difficult to straighten them again, especially after they have remained for a length of time in the rank. When the tobacco is in good condition for casing—which will require some judgment on the part of the grower to determine—it is packed in boxes, each kind by itself. To prevent danger from the rotting of the butts "head boards" should be placed at the ends of the cases. These "head boards" are simply short boards one inch thick placed vertically between the corner pieces of the cases. Against these the butts of the "hands" are placed while packing. When the case is filled the boards are removed, which leaves a space one inch wide between the tobacco and the ends of the case. This allows some circulation of air and prevents the accumulation of moisture, which sometimes causes the rotting of the butts.

In casing tobacco, the "hands" are placed in pairs about the case in layers, commencing at one corner and passing across the case to the other corner, and the same at the other end of the case. Great care should be taken not to injure the leaves by heavy, coarse boots or by any injudicious handling. The "hands," as they are laid in the case, are "kneed in," that is, the packer, who stays within the case, presses down each pair of "hands" with his knees as he lays them in place. The number of pounds to be packed in a case should vary somewhat with conditions. A fine leaf will not bear as tight packing as a coarse leaf, nor will damp tobacco stand as tight packing as dry. Therefore, I recommend that for fine wrappers, sufficiently damp to handle nicely, 350 pounds be considered sufficient. If the leaf be heavy or coarse, so that it will stand a heavy "sweat," 375 or 400 pounds will not be too much. This applies to the usual size of cases, which will be noted further on. With binders and fillers, which are usually drier than wrappers, I consider 400 pounds to the case about right. In all instances, unless the tobacco is too wet, some kind of a tobacco packer will be necessary. The packing or pressing is done by lever power. Various patterns of presses are in use, which space will not permit me to describe here, but which may be invented and made by any person of ordinary ingenuity. Cases should be placed on their sides when stowed away, and they should be up out of the water and wet. Tobacco should be packed lengthwise of the case in every instance.



GROUND PLAN OF CREAMERY.—FIG. 258.

Tobacco Cases.

Tobacco cases should be made of pine, dressed on both sides with corner pieces of hemlock or spruce so that they will hold the nails well. Our present cases are three feet six inches long, by two feet six inches high and wide, the measures being computed from outside to outside. Inch boards are used. The corner pieces should be two inches square; eight-penny nails should be used for nailing the sides and ends and ten-penny nails for the top and bottom where they are driven into the edges of the boards. About 50 feet of lumber are required for making a case of the above dimensions, excluding corner pieces. They are usually put together by men who make it a business, and they are sold for from 80 cents to $1 each, according to quality and price of materials. It is important that they should be dry when tobacco is packed in them, otherwise the moisture in them will become absorbed by the outside leaves and these will be stained.

Moreover, they must be weighed before the tobacco is packed in them, and in order that their right weight may be ascertained they must be *dry*. Right here is a point where dishonest growers have been found to resort to knavery, some weighing cases that are wet, and others adding three or four pounds to the actual weight of dry cases. The cases should be weighed *correctly* and the weights marked plainly on the ends with red chalk or a blue pencil. Sometimes when unusually long tobacco is had, a larger size of case is made and the length is increased from three feet six inches to three feet eight or ten inches. In the same way very short tobacco may be packed in shorter cases than usual, with good judgment.

Horticultural.

RURALISMS

THE destruction of cabbage and cauliflower plants last Summer by the maggot of a fly, whose name at this moment I cannot recall, was very great. This is a visitor from the West. I found, as the result of some experiments, that a large percentage of the plants could be saved by dipping the roots, before planting, in a puddle made of lime, soot and earth; and I think that lime and earth would answer nearly as well. The lime should predominate. It involves some trouble on a large scale, but the experiment is worth repeating. To *know* whether it is worth anything, a portion of the plants should be put in without recourse to the puddle. In some localities near New York, but more especially west of it, the cabbage, radish, turnip, and allied plants were a complete failure, the roots being eaten off of many of the plants while still in the seed-bed. One market gardener assured me that he had lost over five thousand plants from this cause. The maggot seemed to be particularly fond of the delicious yellow turnip. I did not succeed in raising a single root. Where this maggot abounds, a heavy application of shell lime before sowing the seed, would probably have the effect of checking its ravages.

THAT excellent and usually reliable evening daily, the New York Commercial Advertiser, a few days since said, "The first producer of the Lawton Blackberry was buried yesterday," alluding to the death of Mr. Lawton, formerly a member of the New York bar. Mr. Lawton, however, was not the "first producer" of the Blackberry alluded to, though it has been so stated many times. I have had occasion to correct this and similar errors before. As the New Rochelle Blackberry may be said to have been the pioneer of improved blackberry culture, a few words in regard to its early history may be interesting to the readers of the RURAL. Mr. Secor, of New Rochelle, first saw it growing wild; and being struck with its remarkable size, productiveness, and fine quality, removed the plant to his garden, where it soon multiplied. He gave it freely to such of his neighbors as would accept of it, Mr. Lawton being one of them, and one of the very few, in fact, who thought it worth a place in the garden. I will state, as an interesting fact connected with this famous blackberry, that Mr. S. P. Carpenter told me that for about nine years he could scarcely find a man who would accept a plant as a gift. To cultivate the blackberry seemed at that time preposterous. Times have changed since then.

To Mr. Lawton belongs the chief merit of having changed all this. With characteristic shrewdness, he saw money in this fine fruit. Having first propagated it largely, he took a liberal supply of the ripe berries to a meeting of the Farmers' Club in New York, where its large size, handsome appearance, and real excellence created a sensation; nothing like it had ever before been seen. Mr. Lawton asked for a committee to visit his farm and see the plants in fruit. A committee accordingly made the visit, I being one of them. They made a report which increased the sensation, led to much talk, and in this way secured the success and popularity of the blackberry, and a nice little sum to Mr. Lawton for his perseverance. The change was remarkable. In a few weeks, instead of being unable to find a man who would accept a plant as a gift, the difficulty was to find plants enough to supply the demand at almost any price. It was planted by the acre, and thus led the way to the cultivation of the blackberry as a profitable crop for the market.

A discussion speedily arose as to the name of the plant. Some thought it should be called the Lawton, in recognition of that gentleman's labors in bringing it to public notice; others thought it should be called the Secor, as Mr. Secor had originally discovered it, and it was locally known by his name; still others, and much the greater number, thought it should be called the New Rochelle, as that would settle the dispute and honor the place where it originated; and by the latter name it has since been generally known. This, briefly, is the early history of the New Rochelle Blackberry.

I LEARN by inquiry among commercial florists around New York that more than one-third of all the plants they ship go west of the State of New York, and that many more would go in the same direction were it not for the heavy express charges. This fact, in connection with what I learn from private correspondence, leads me to believe that many of our Western friends are not one whit behind us in plant culture; and it is very pleasant to know that this is so, for a real love of flowers not only exercises a very soothing influence over the cares and sorrows of life, but goes a great way in developing and fostering that home feeling which, as yet, is one of our greatest wants as a people.

WHAT has become of Cercis Siliquastrum, the European Judas-Tree? I miss it latterly from the catalogues. It is a form intermediate in size between C. Japonica and C. Canadensis. It can hardly be that it is omitted for want of hardiness, as I know it to be perfectly hardy in New York and in some of the New England States, as trees some 30 years old abundantly testify. I have often found that Cercis Siliquastrum could be effectually introduced on moderate-sized lawns better than the larger C. Canadensis (American Red-bud or Judas-Tree), and have several times recommended it this Spring, but it could not be found. It is too handsome and useful a tree to be lost. A suitable place can always be found for C. Japonica, even on a city lot, and it is pretty enough to command a place anywhere. Let me say to the readers of the RURAL, however, that it is not a bedding plant, neither is the peach. I mention this because I have just seen both used in that way on the lawn of a wealthy gentleman; that is to say, in an oval bed, eight by fourteen feet I found two Cercis Japonica, one Purple-leaved Peach, two Double-flowering Peaches, one lilac, three spiræas, one Cydonia Japonica, two upright honeysuckles, two syringas (Philadelphus), and two deutzias. This bed had been recently planted by a man who calls himself a gardener, and it does infinite credit to his ability to make little out of much. The C. Japonica is much like a shrub in size, but it should *always* be planted by itself as a single specimen.

Arboricultural.

THE PRESERVATION OF OUR FORESTS.

"CLINTON."

TREES may be considered as marking the highest point of the vegetable growth. I claim that from the first they were essential to the perfection of many others of the creations connected with our earth; essential to its preparation for the habitation of the human race; essential in furnishing food and protection to the animals which were to become subservient to man's will and use; essential in their sheltering and modifying influences for the protection of the smaller vegetation so important for man's comfort, both directly and indirectly; and essential, also, in furnishing him with the three most important requisites for his continuous existence on earth, viz., food, fuel and shelter. True, after man's seemingly permanent establishment by the aid of these, substitutes might be devised for a portion or all of them, but that militates not in the least against the positions I have taken.

In a former article I attempted to show that our supply of timber was being rapidly diminished, and that the original forests of our country are being swept off with alarming and wanton recklessness. It is not from the people of our older-settled States alone that the cry of alarm comes up. Michigan and Minnesota, as well as Maine, are each sounding the note of alarm, in view of their now devastated forests but so recently their pride and their protection. Even our neighbors on our northern borders respond to, or unite in, that cry of alarm, and through their public journals are calling upon their Provincial Government to check the evil. The Quebec Chronicle of recent date says:—"The valuable forests which cover large portions of our territory are being so rapidly swept away that the supply in the course of a few years must be entirely exhausted." The Toronto and Ottawa papers express similar apprehension.

In view of this condition of things the question naturally arises, what remedies can be devised to check or retard the evil that seems to threaten us? The first and most obvious one would seem to be the *conservative policy*. This, if I understand aright, is what the late President and the Secretary of the Interior endeavored with such earnestness to recommend

the last Congress at its last session to adopt, or, rather, to enforce with more stringent provisions. It was not the first time that the matter had been urged upon the attention of Congress, but then, as lately, without manifest results. Another year, therefore, must pass before any move can be hoped for in the desired direction.

"But," says one, "have we not already sufficient laws for the preservation of our public forests?" True, we have, if those laws were rigidly enforced. But, unfortunately under our form of government, it seems to be difficult to enforce such laws, or, rather, we have not, properly, any officer whose special duty it is to see to their enforcement. Under a monarchical government it would probably be different; but under our free government the opinion has seemed to be quite general, that the public forests being the property of the public, every individual member of that public was part owner, and consequently had a right at any time to take and appropriate to his own use or benefit such portions of such timbers as he desired. Admitting that it was known that such trespasses were prohibited by law, yet from its non-enforcement the prohibition came to be considered as merely nominal, and the success of the trespasser in managing to escape any penalty or forfeiture came to be regarded as evidence of his peculiar smartness, even by those whose duty it was to prosecute the offender. And, indeed, we have good authority for asserting that our Government has, on some former occasions, paid extravagant prices to contractors for ship timbers which were stolen from its own lands. It is some satisfaction, however, to know that recently such trespasses are occasionally detected, and the trespassers properly punished.

Now, this matter of the preservation of our forests, is one which immediately affects the interests of all our citizens, but more directly the interests of the agriculturist, which is my apology for attempting to call the attention of that class of citizens to it through the columns of the RURAL NEW-YORKER, in which it might otherwise, perhaps, be considered out of place. Let each one of that class see to it (and their proportion of our voting population is very large) that *his* Representative is properly posted on a subject so immediately affecting his interests. It cannot be denied that as a rule, a treeless country is but another name for a desert land. There may be some exceptions, it is true, but still the rule is a very general one. Under it successful agriculture becomes almost an impossibility without a great outlay for irrigation, and that is not always practicable or even possible. Witness the vast desert plains of portions of Asia and Africa, once the seats of civilization, and the proud possessions of the most powerful peoples of the earth; but now only desolate wastes, unoccupied, or occupied only by wandering tribes of nomadic savages and robbers. Witness the central and some of the southwestern plains of our own territory, now so treeless and naked and almost streamless for many hundreds of miles in some directions, where one may travel for days in what evidently were once the channels of large streams; but in which now scarcely a drop of water ever appears. And yet there is good reason to believe that on these vast plains, trees once grew and flourished, and that the land was once occupied and successfully cultivated by a race, long since extinct, who were of a much higher grade of civilization than those we are accustomed to term the aborigines. The conservative policy is therefore, I claim, the true policy of our Government with reference to its public forests. True, that policy may not be of much avail in the existing States, although the General Government claims to have its reservations in some of those States; and further reservations should be judiciously made in its remaining territories; and if made, let us see to it, that those reservations are properly respected.

In most of the countries of Europe the forests are placed in the direct charge of public officers, appointed for that special purpose, and called "Masters of the Forests," or "Conservators of the Forests" or by some other equivalent title. For such a course we have a precedent of ancient date, for we read that in the days of David, King of Israel, a special officer, Baal-hanan, the Gederite, was appointed to superintend "the Olive trees, and the Sycamore trees, that were in the low plains." In England the "Crown Forests," as they are called, are specially and carefully guarded, and, contrary to our practice, their extent is being gradually increased from year to year. In France the main supervision of all matters pertaining to the preservation of the forests has heretofore been in the hands of the Minister of Finance; but recently a move has been made to transfer all these matters to the Minister of Agriculture, as being more appropriate, for valid reasons given.

Would it not be well for us to give the charge of our national forest reserves to our Commissioner of Agriculture? or at any rate to give the supervision of them to officers specially appointed for that purpose, as in Europe? The idea seems to me worthy of serious consideration. It may be objected by some that it would not only involve additional expense, but would furnish additional offices for partisan purposes. But to these objections it may be replied, first, that the object is worthy of the expenditure; and second, that the same objections would apply to any other of our executive officers.

I claim then, that the conservative policy is the true policy of our government in regard to its remaining forests, in which the whole country is interested. But as connected with this whole subject, every individual, especially every land owner, has a duty to perform but of this I have not space to speak at present and therefore must let it pass till time and opportunity shall seem favorable.

EXPERIENCE IN RAISING TIMBER ON THE PRAIRIE.

HAVING settled down here upwards of 40 years ago, I am well acquainted with all the trees that thrive in this neighborhood, and for growth of tree and durability of wood and general usefulness I know of no tree so valuable to the farmer on the Western prairies as the European Larch.

Some six years since I saw a note in the RURAL NEW-YORKER that Robt. Douglas, of Waukegan, this State, had larch plants for sale. In the Spring I visited his nursery and found him packing them by the thousands and sending them in about all directions. I ordered 4,500 of those about 12 to 15 inches high and about as large as black-lead pencils. I had the land plowed deep and made mellow, planted the young things four feet apart each way in straight lines; planted two grains of corn on the south side of each young tree to act as shade when the hot and dry weather should set in. I cultivated the land well. The ears of corn were the largest and best filled on the farm. This I attributed to there being only two grains in a hill and to the crop being well tended. I followed this plan for two seasons. Two years afterwards I ordered 4,500 more and planted them as above. All have done well. Neither heat, cold nor insects have injured them so far. I tried to cultivate them the third year, but found I could not get the horse and cultivator through without injuring the young trees. To-day many of those trees stand 16 to 18 feet high, and are six inches through, two feet from the ground. The thinning out will soon furnish me all the posts I need, and they will last longer than any other timber I know of.

Some 25 years since I visited my native home, England, and saw hundreds of acres that had been planted since my remembrance: some on as good land as I ever saw, and some on land as poor as could be found—gravelly hillsides as steep as the roof of a house, land that as far back as I can remember did not yield the owner one penny per acre; yet the timber even on this poor land, if sold now, is worth double the price of the best meadow or arable land on the estate.

It may be asked why I did not plant sooner. The answer is, first, I had plenty of timber; second, I did not know where to get the plants. I settled on the open prairie where the wind in Winter cut like a two-edged sword; I had often to face about in going from the house to the stable to catch breath when it was blowing one of those northwestern blizzards we often experience on the prairie. I began to plant trees—hard maple—the first year, some forty years since. They grew well and are now large trees. Next year I bought some locust seeds and planted about half an acre in drills. They grew fast, and had got large enough for posts when the borer attacked them and destroyed the whole, so that I had to dig them all up. Now the ground is covered with maple, larch, elm, black-walnut, butternut and even evergreens of different sorts. My house, outbuildings and orchards have the protection I have long wished for.

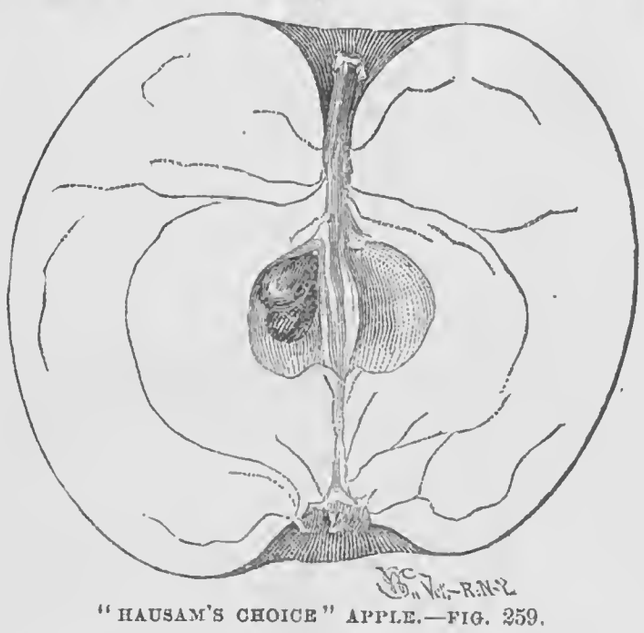
I often hear folks say: "I have no luck in planting, like you." The great secret in planting is to get your land in good and deep tilth. Don't be niggardly of your labor if you want the trees to grow, for if you try to cheat them, it's likely you will get cheated in the end. To me it is a desolate sight to see a house and outbuilding and stock on a cold day without a wind-break, when so little time and labor are required to raise one, and we now know what to plant with safety. For many years past we have had more black-walnuts and butternuts than our family can use, grown from the seed.

Winnebago Co., Ill. THOMAS LAKE.

Pomological.

"HAUSAM'S CHOICE" APPLE.

IN the year 1816 Daniel Lane, the first white man that settled in this county, two years before Illinois was admitted into the Union and eight years before Paris, our county-seat, was laid out, planted two apple orchards with yearling seedling trees brought from Vincennes, Indiana. One of these was a small orchard of about 30 trees planted where his barn was built some years later. These trees received the wash of the barn and feed lots, and, doubtless, many of them were destroyed by the stock. Twenty-five years ago not more than half a dozen of them were living. Fifteen years ago all had disappeared but a single tree. This is now 60 years old, having outlived all its fellows.



"HAUSAM'S CHOICE" APPLE.—FIG. 259.

It is known throughout the neighborhood as the "Lone Tree," and might with great propriety have been named the "Lone Apple." I have just examined it. It is perfectly hardy; there is not a blemish on it; its trunk, two feet above ground, measures eight feet three inches in circumference. It is 25 feet high with 18 feet spread of the branches. The past season it has made a moderate growth, and has annually, within the recollection of the oldest observer in the neighborhood, been producing full crops of fine, smooth fruit noted for its long-keeping property. It usually keeps through May. D. S. Curtis, the oldest nurseryman in this county, has named it Hausam's Choice, in honor of the son-in-law of Mr. Lane, who now owns and lives on the farm.

B. O. CURTIS.

REMARKS.—The shape is shown by the engraving. Skin rather hard. Flesh nearly white, mild, sub-acid, of agreeable flavor; not very juicy. Dark red, streaked with darker red.

PEACHES.

In the Michigan "Fruit Belt."

T. T. LYON.

PULLEN'S SEEDLING is a yellow peach, ripening about the middle of September. It originated with the late Isaac Pullen, of Hightstown, N. J., two or three years before his death, which occurred in 1868. It possesses desirable qualities as a market fruit, and ripens after the hight of the peach season—a circumstance that renders it the more desirable. As far as known, it is grown by very few persons, but is esteemed valuable by those who know it.

REEDING'S LATE RED has fruited here but a year or two, and is not at all disseminated. It is a handsome, creamy-white peach, with a red cheek and white flesh, reddened at the pit; tender, melting, juicy, mild in flavor. It seems to be a desirable dessert peach for its season, which is after the middle of September. It is a freestone.

KEYPORT WHITE is one of the latest peaches generally grown here. It is, in fact, one of the latest that can be relied upon to ripen perfectly in unfavorable seasons, and can only be recommended for southern localities. It is a large, roundish, white peach, with a brilliant cheek, very attractive in appearance—a freestone; but it cannot be rated very high in quality. It has been long known here; but has not been extensively planted.

YELLOW OBLONG is a name that comes to us from Pennsylvania, designating a peach very similar in season and general character to Smock Free, and of the same season, although differing from it in several respects. It seems to be a good bearer, and promises well as a market peach; but its reputation in this particular is yet to be established.

LADY PALMERSTON is one of the late Thomas Rivers's seedlings, of large size, yellow with a rich, dark-red cheek; flesh, rich, firm, moderately juicy, yellow; flavor, subacid, vinous, sprightly. Ripens at the end of September. It is entirely new here. I regard it as very promising for market purposes. The tree is hardy, vigorous and productive; and the foliage broad, large and rich, with reniform glands. Freestone.

WILKINS'S CLING is a name which comes to us with trees from Central Ohio, but which is not recognized by pomological writers, so far as I know, even as a synonym. The trees have borne, the past season, for the first time here; and, although I have had no opportunity for comparison, I from recollection, strongly suspect it to be Large White Cling. Be this as it may, it is certainly an exceedingly beautiful peach, of fine quality, and productive, ripening the last of September. Its leaf glands are obscurely reniform; while those of Large White Cling are said to be globose—a difference which may possibly be due to hasty observation.

SHEPHERDIA ARGENTEA.—In connection with your notice of the Buffalo Berry in the RURAL of April 30, the fact should be mentioned that not only is the tree ornamental, but the fruit is useful. The tree is sexual, requiring both male and female to produce fruit, but when thus grown the fruit is so abundant as to show its brilliant color to the tips of the branches. The trees require annual pruning to maintain a good form. The berries, when canned, make a serviceable sauce and a pleasant pie in Winter. A few trees in any neighborhood would soon incite to their general introduction. Your Rural Brieflets are very interesting, but the clematis, in the same number, did not receive full justice, as you did not mention one of the very best—C. viticella venosa. Were you to limit me to one variety for Summer blooming, I think this would be my choice. It is just the thing for covering stumps or for rock-work; a vigorous grower, and gives an abundance of quite large, reddish, purple-veined flowers.

A. A. B.

Newburgh, N. Y.

The Herdsman.

NOTES BY A STOCKMAN.

IN regard to the photographing of animals, I might have very properly said in my former remarks on this subject, in the RURAL of April 16th, that the photographer should use the long-focus lens with which he takes landscapes, and make the animal the center of the picture. This lens possesses what microscopists call penetration as well as breadth; that is, it gives depth to the picture, while one used for portraits has neither breadth nor depth and the focus is short and no more than a point. If one rolls up the hand so as to form a sort of tube, and looks through it with one eye at the picture of Prince of the Realm, in the above issue, the bull will be seen to stand out solidly from the distance and then the space between the fore feet will be seen naturally.

"A" is correct in the RURAL of April 30, in his remarks about this bull. The animal was only 15 months old, in ordinary store condition when pictured. When the loin is well filled up with full-grown muscle or inside fat, the fault in the back will doubtless disappear. A year's growth, too, would lengthen the thigh and raise the rump and square out the end so as to remove the ill setting of the tail: at least, that is my judgment. I have not seen any of these fine cattle "on their native heath" for more than 25 years, and they have been greatly improved since then. I entirely agree with "A," whom I think I recognize as one of the oldest and best informed judges of cattle, as to the demerits of this particular animal; but among the photographs of other cattle sent me by his owner there are some which I am sure "A" would consider equal to the best. But this was selected to point a moral in regard to photographing live animals.

I DON'T think the plan suggested by "A" for getting a picture would do. If the artist had the experience and the eye for the unities of a beast, which "A" possesses, it might do; but I fear a picture so made up would be a thing of shreds and patches," and as unlike a good cow or a good bull as Barnum's wooly horse was unlike the Hambletonian. We cannot reach perfection and must take the best we can get.

A GREAT deal is said just now about abortion among dairy cows. It is causing serious loss in many herds. All sorts of reasons are assigned for it; but the true cause is overlooked.

This is infection. It is known to be as infectious or contagious a disease as pleuro-pneumonia in cattle or the scab in sheep. It can be conveyed by inoculation. When the truth is known it is not difficult to find a remedy. And the disease has been shown by Pasteur to be due to infusorial germs similar to those which produce cholera in swine or in poultry. When we know that it can be easily carried from cow to cow or from stable to stable by the air or by persons attending to the animals, one means of prevention at least is obvious; however difficult it may be to find a cure.

By and by, there will be complaints about loss of lambs by the disease known as the pale disease, paper skin, anæmia, bloodlessness, cough, husk, hoose, etc., etc., and persons will be inquiring, What shall we do to save our lambs? Here is another serious trouble which has a most simple remedy. All that is required is to keep the lambs off from pastures where old sheep have run. The old sheep void, in their dung, myriads of eggs of the worms, (thread worms, Strongylus filaria), which cause in the lambs this disease with so many names. The eggs adhere to the grass and are taken into the lambs' stomachs, or they are also taken in with water that is drank, and from the stomach the worms proceed to the intestines causing trouble there, or ascend the gullet and pass into the wind-pipe and descend into the air passages and the lungs.

What is the Poland-China hog coming to? And where will soon be the Poland-China about it? This used to be a black-and-white-spotted animal descended from variously claimed races, but never a word was said about any Berkshire in it. But year by year it has been changing its spots and growing in blackness until now it comes out black all over, except four white feet and a white stripe down its face. Now the question is, if such a pig is a Poland-China, what is a Berkshire; and has a Poland-China been improved into a Berkshire? A recent illustration in a Western Stock Journal of a sow, Black Beauty 10th, which is said to be a Poland-China, is certainly provocative of such an inquiry as this. If this is a true representation of a pig of such breeding, then all the Poland-China has been bred out and all Berkshire has been bred in. Then what comes of the claim of the Poland-China breeders that their sort was the best pig for all uses that was ever produced.

Per Contra, the Berkshire breeders may feel a little set up about such an event.

A Prolific Breeder, Indeed.—W. S. Moore, Jr., of New Berlin, N. Y., referring to Frank Snedd's boast in a late Rural about an Oregon cow that was "some pumpkins" on calf-getting, says that it would take half a dozen such cows to equal one owned by Mr. Burrows, in that neighborhood. This cow, our veracious correspondent asserts, has given birth to six calves this Spring. Knowing there may be some incredulity with regard to the entire accuracy of this statement, he refers all "doubting Thomases" to John Gaskin, New Berlin, N. Y., "who now has the calves."

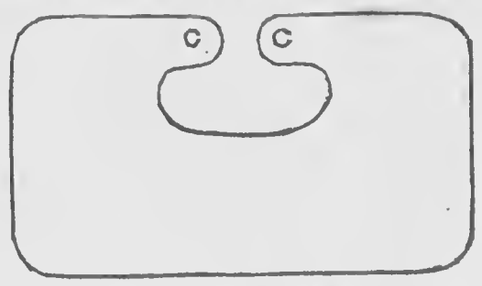
Dairy Husbandry.

OLEOMARGARINE FROM A FARMER'S STANDPOINT.

Among other good articles on various subjects that are constantly appearing in the Rural was a late editorial on tallow butter and lard cheese. Farmers in this county are specially interested in the condemnation of these concoctions, for this has long been a dairying and hop-raising section; and, of course, we are honestly opposed to all spurious imitations of our genuine dairy products. Already many of our well-to-do dairy farmers are turning their attention to hop culture and sheep raising almost exclusively, because their butter has to meet the competition of the counterfeit article. It is only the large creameries and dairies that pay nowadays. The outcome is likely to be that the butter-buying public will soon either have to pay an extravagantly high price for real butter, or rest content with the miserable trash miscalled by that name, but made of any sort of animal fat or oil, which misapplied chemistry, capital and brains can transform into an imitation of the genuine product of the cow. That there is money in the business of making the spurious stuff the many factories in different parts of the country bear witness; but that the imitation pays is a convincing proof of the superiority of the original for which it is sold. We consider the making and selling of bullock butter and hog cheese just as bad as the making and selling of ardent spirits. The business is dishonorable inasmuch as the dealers, as a class, cheat the public by obtaining their money without giving them what they paid it for. We believe in calling things by their right names, and such dealing we stigmatize as swindling. While regretting the manufacture of the stuff as injurious to our own interests, to the health of the public and the morality of all who deal in it, our main ground of objection to it is that it should be sold under the name of a product for which the dairymen of the country, by years of study and labor, have won the reputation which now makes its counterfeit salable. The dealers in the spurious concoctions make use of our good deeds to injure us. W. B. Nearing.

Otsego Co., N. Y.

An Anti-self Milking Device.—Our friend J. G. B., of McGrawville, N. Y., sends us the accompanying sketch of a device for the above object. In describing it he says: "A piece of half-inch basswood board, seven by four and a half inches, is all that is required, and the contrivance can be made with a jack-knife in five minutes by following the diagram. The space



ANTI-SELF-SUCKING DEVICE.—FIG. 260.

between the arms, C, C, should be only half an inch. Insert one arm in one of the nostrils of the cow and then by a peculiar "twist" slip the other arm into the other nostril, and the job is done. The device will in no way prevent the cow from grazing, but it will prevent her mouth from touching either her own teats or those of a companion. During the past couple of years I have seen it used on some of the worse self-sucking cows in this neighborhood, and I have yet to hear of the first instance where it has failed to effect a complete cure. I do not know whether it is a new invention, but I have never seen it described either in the Rural or any of the other agricultural papers."

Remarks.—This nose-piece was first described about 20 months ago in Professor J. P. Sheldon's Dairy Farming, from which the illustrations and description thereof were promptly reproduced in the Rural New-Yorker of Dec. 6th, 1879. Both were again reproduced in the Rural of April 17th, 1880, in the Querist Department, in answer to an inquiry about the best anti-self-sucking device. To show how the nose-piece is used we once more present to our readers one of our former illustrations—that which shows how the device appears when fixed on the cow.

DEVICE ON COW.—FIG. 261.

We know that our friend of McGrawville has been an ordinarily attentive reader of the Rural for more than two years; but his forgetfulness shows how many really excellent things in it are not noticed so as to be remembered by many readers.

Casting the Calf-bag.—A friend referring to our directions for treating inversion of the womb in a cow, in the Rural of April 2, says that he had a cow which was troubled in that way for several years *before* calving, and he always found the following remedy efficacious. It must not be prepared, however, until needed: Clean the parts and sprinkle freely on them the following mixture finely powdered;—two tablespoonfuls of burnt beans; one tablespoonful of black pepper; one tablespoonful of chalk; one tablespoonful of alum. Replace the parts and put on harness, as directed in article above referred to.

Remarks.—A cow *never* casts her "withers" or "calf-bag" *before calving*. It sometimes happens, however, that from various causes the vagina or the rectum of a cow becomes inverted, and it must be to such a case our friend alludes. Only a strong cow could survive the application of the recipe he gives, if used as directed. The best treatment in such cases is the same as that described in our article of April 2.

A Large Milk Yield.—Mr. Gerrit S. Miller, Peterboro, N. Y., writes under date of May 3, as follows: "My Holstein Cow Ondine (winner of first prize at the last N. Y. State Fair) during ten days of last month produced 84 6 pounds of milk on *dry* feed. For eight days her daily average was 85 pounds 10⅘ ounces. The highest yield in one day was 90½ pounds. She is now milking about 80 pounds per day."

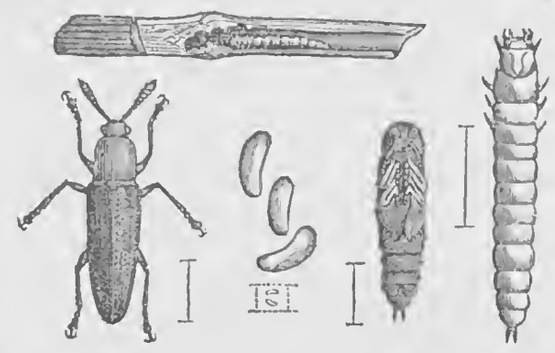
Entomological.

THE CLOVER-STEM BORER—Languria Mozardi.

Though the larval habits of this insect have been but recently described, (See Prof. Comstock's report in Department of Ag. Report, 1879,) yet the beetle has been known for some time. It had been supposed that most of our species of the family to which this belongs, lived in fungi—puff-balls, toad-stools, etc.—though some of the tropical species are leaf-eaters.

The illustration represents the full-grown larva, the chrysalis, the eggs, the beetle and a stem of clover cut open to show the larva on the inside. The beetle is small, slender, reddish, with dark blue wing-covers. It gnaws the sides of the stalks of Red Clover in the early part of the season. After properly preparing the place the female beetle deposits a small, yellowish egg as far into the gash in the side of the stalk as she can push it. The egg soon hatches to a slender grub that feeds wholly upon the pith of the stem till it has attained its full size, being then of the length of the line by the side of the larva in the cut It changes to a chrysalis in the lower end of its burrow, from which the beetle in due time emerges.

A single one of these borers in a stem of clover does not kill the stem, but it serves to weaken it, and when the borers are very numerous they do considerable damage. Prof. Comstock thinks that when the clover is cut early in the season, and then again late, little harm can be done by these borers. As



CLOVER-SEED BORER.—FIG. 262.

the beetles do not come out till August, cutting the clover early would make it probable that the larvæ would not live in the dry stems of the hay, while cutting a second crop would head off those that had come from eggs laid after the first cutting. If the cutting were only partial, the clover left in the corners of the fences or elsewhere would serve to develop beetles enough for "seed" for another year. There is probably but one brood of the insects in a season, hibernating in the beetle state.

Carbondale, Ill. Prof. G. H. French.

Farm Topics.

A CORD OF GREEN COW-DUNG.

In the Rural New-Yorker of April 30, page 291, I notice a criticism upon Dana's weight of a cord of green cow-dung, which should not pass unnoticed. Probably no man in America was better qualified to state absolutely the weight of that one commodity than he, for his connection with a large calico printing establishment which uses immense quantities of it, made it as necessary for him to know its weight as that a grain merchant should the weight of a bushel of corn. The statement that "there is nothing in cow-dung heavier than water" must be erroneous, as cow-dung always sinks in water like a stone. I took a sample this morning within one minute after it was dropped and put it in a pail of water. It went to the bottom instantly, and remains there still as compact as when put in, several hours ago. Even horse-dung sinks, as I have had frequent occasion to know. O. S. Bliss.

Remarks.—Will Mr. Bliss kindly state what there is in cow-dung that is heavier than water and why our statement "*must be* erroneous." Seventy-five per cent. of it is water, or 77½ per cent., according to some authorities, and the remainder is vegetable matter, with some little animal matter as mucus, all of which is of less specific gravity in its natural condition than water. We, too, have this moment of writing placed in water a compact fresh dropping from a cow that is fed upon eight quarts of grain food daily with clover hay, and whose dung is unusually solid, and we find that it floats in quite a lively manner. Mr. Bliss must know very well that circumstances—unless they are exceptional—do not alter cases that are founded upon such a reasonable and certain basis as the specific gravity of substances. If the cow eats hay, or grass, or bran, or cornmeal and drinks water, and digests from the food the most solid portions, rejecting chiefly the lighter cellulose and the water, how can the rejected parts be made heavier than the original matter by passing through the cow? The corn is certainly heavier than water, but the rest of the food is not, and the whole is lighter. Even the dung of horses fed wholly on oats, without hay, floats in a trial made at this writing. Mr. Bliss has had his own fights on this question of specific gravity with regard to cream, and knows we think too much about it to defend what is a clear error of Dr. Dana's. The statement that Dr. Dana should know the weight of cow-dung because he was connected with a calico printing establishment should have no effect on this question.

A chemist is employed in printing works, not to *weigh* cow-dung, which is used as a mordant in the dyeing of the cloth, but to watch its chemical reactions as well as those of the various dye stuffs and colors used. The specific gravity is of no importance whatever, and it is improbable that Dr. Dana ever considered it in this light in his connection with calico printing. A precise analysis of cow-dung, made by a chemist of a print works now before us, is as follows:—water 69.58 per cent; bitter matter 0.74; sweet substance 0 93; chlorophyl 0 28; albumen 0 63; muriate of soda 0 08; sulphate of potash 0.05; sulphate of lime 0 25; carbonate of lime 0 24; phosphate of lime 0.46; carbonate of iron 0.09; woody fiber 26 39; silica 0.14; loss 0 14. Of these the mineral matters—1.31 per cent—are heavier than water and 28 97 per cent are lighter. On the whole this analysis would show that cow-dung should be lighter than water. If not will our friend show why not?

ORCHARDS, PIGS AND CLOVER.

Corn is perhaps as well suited to our apple orchards, until the trees are of good fruiting size, as any crop we could plant. The cultivation required for corn is such as also suits the growing trees, and it ceases at a time when they should not be pressed to further growth for the season, allowing them to rest and ripen for Winter. The corn also gives the necessary shade which the trunks, while young, require. Artichokes are also good to be planted in the tree row—not nearer to each tree than four feet.

Pigs are the best stock to have access to the orchard. They will do the most good and the least harm. They may be given free access to the orchard as soon in Autumn as the corn is cribbed. They will glean the corn-field, harvest the artichokes and give the land a pretty thorough Fall plowing. They will also spread much valuable manure and destroy millions of hurtful vermin in the larval state. The artichokes promote the health and rapid growth of the pigs, which, without other food, will be half fattened by the time the frost stops their rooting. Then liberal "corning" soon fits them for the butcher.

When the orchard is older, the trees well grown and required to fruit, the crop may be changed from corn to clover. This does not promote the rapid growth of the trees, but it increases the fruit, and is very beneficial to the soil and young roots of the trees, protecting also the whole surface from the scorching sun in Summer and severe frosts in Winter. At the same time it affords a real paradise for the pigs, which may now occupy the orchard through the Spring, Summer and Autumn. A large number will find ample, nutritious food in the succulent, growing clover, upon which they will thrive and grow rapidly, doing no hurt to the trees, but much good by catching bugs and worms a thousand boys or men would never find. The apples which drop prematurely contain worms, which caused their fall. The pigs pick up this worthless fruit and with it eat the worms, and thus prevent an increase to millions more. On this fine pasturage the pigs are so well grown as to be ready for sale in September, as feeders, and all the growth is profit. "Jot."

Springfield, Mo.

A Stone Drain.—Referring to the method of making a stone drain, mentioned in the Rural of April 16, in answer to a correspondent, E. W. S. writes us from Afton, N. Y., that instead of laying a row of stones close to each side of the ditch for flat stones to rest on, as there described, he would lay only one row of stones in the ditch, and then lay large, flat stones with one end resting on the bottom of the ditch and the other on the stones along its side. Speaking from experience, he says that a drain laid this way is more durable than one made after the other fashion, because, as the flowing water wears away the bottom of the drain, the two rows of stones along the sides will "work" together, an end that is hastened by the action of frost and the pressure of the sides of the ditch. As they are forced close to each other, the drain is gradually damaged, and finally destroyed on their coming together. On the other hand, when only a single row of stone is laid along one side of the ditch the flat stones lying at an acute angle with it, press it against the side of the drain, so that it can be forced out of its proper place, neither by outside pressure, nor by the action of the water as it washes down the middle of the ditch or drain.

An Evil Without a Remedy.

A FRIEND writes us from Van Wert, Ohio: "I would like to ask how farmers near to cities and towns can prevent persons, both those grown up and children, but especially the latter, from traveling over their fields. I am pestered too much with people gathering grasses, hunting flowers and birds' nests, shooting, hallooing on Sundays, getting dirt for flower pots and rambling through fields and woods for no purpose whatever but to while away the time and amuse themselves. They frighten my stock and keep them on the move by throwing at them. Now what shall I do! I apprehend that it would displease many to prevent them from going where they choose. Is there a remedy?"

REMARKS.—We cannot give one. Many such trespassers do not regard polite requests not to do so, and their offenses are scarcely of such a character as to be stopped by legal proceedings. We have at the RURAL FARM many causes of such complaints, and patience is often tried beyond endurance. But we have found no effectual remedy.

MOST profit is found in growing tobacco on farms where the business is carrried on to a small extent, and where great care is exercised to enconomize fertilizers. A few acres of the best part of the farm devoted to this crop with garden culture and such care given the crop as will produce the largest percentage of the best leaves, will doubtless prove profitable.

Industrial Implements.

The Greencastle Grain Drills.

These drills, a cut of one of which is given herewith, have been in general use for the last 25 years, and are built at Greencastle, Penn., by J. B. Crowell & Co., who are devoting their entire attention to machinery for seeding purposes. While building plain drills for sowing grain and grass seed only, they also make a specialty of a combined drill that sows phosphates, guano, or any of the properly prepared commercial fertilizers that are found in the market. The latest improvement connected with this implement is an Automatic Cut-off, which at once shuts off the flow of the fertilizer, when the hoist lever handle is raised, thus saving, as is claimed, an amount equal to 15 or 25 per cent. of the cost of the drill alone each year.

By using fertilizers the wheat can be sown somewhat later so as better to avoid the attacks of the fly, and yet enable the plant to form a good root and thus withstand the freezing out that Fall wheat is often subject to.

The simplicity and durability of the drill built by J. B. Crowell & Co., at once commend it to the farmer. There is no change of gear wheels to regulate the quantity sown, and the spring hoes which are attached to all their No. 1 drills, enable the farmer to pass over ordinary obstructions without breaking pins, and then stopping the team to replace them. Immediately upon passing over the obstruction the point finds its way into the soil, and commences planting the seed in the furrow, causing no "skips."

Spring hoe drills are now largely used in the rocky, limestone districts of Pennsylvania, Maryland and Virginia, and their sale is being rapidly extended throughout North Carolina and Tennessee, as well as throughout the Western States, where they have been recently introduced. All applications for circulars or for further information, which will be promptly given, should be made by our readers to the above address.

The Horseman.

The Warden.

This fine bay Clydesdale stallion with black and white points, is one of the importations of Messrs. Powell Brothers, Springboro, Pa. He was foaled May 19, 1876, and won first prize in a class for yearling stallions at Castle Eden Show, open to the United Kingdom, in August, 1877. Again, as a two-year-old, he was placed second in a large class of stallions at the Yorkshire Show, at Northallerton in August, 1878. He was sired by "The Swell" (870) winner of the Castle Eden premium of £50 ($250). He by "Farmer's Fancy" (303) by "Lofty" (455) winner of first prize and silver medal at Glasgow. He by "Farmer's Fancy" (298), winner of first prize at the Highland Society's Show at Glasgow in 1844, and second at Dumfries in 1845. He by "Clyde alias Glancer" (153) by "Broomfield Champion" (95) by Glancer 2d, (337) winner of second prize at first show of the Highland Society held in 1826. He by "Glancer 1st (336) by "Glancer alias Thompson's Black Horse" (335) that was foaled about 1810, and was the most noted of all the great founders of the Clydesdale breed.

The Warden's dam was the Marquis of Londonderry, prize mare "Blossom." She was got by a celebrated horse, "Prodigy" by "Samson," winner of first prize at the Royal Agricultural Society's Show at Shrewsbury in 1845, first at Leicester and first at Newcastle in 1846 The Warden's grand dam was by the famous "Bay Wallace" (38), winner of the premium at the Highland and Agricultural Society's Show at Berwick in 1841, and he traveled the Cumberland district for a premium four years in succession. He by "Old Bay Wallace" (572), winner of the Dumfries premium in 1831.

HOW TO PREVENT HORSES FROM CHEWING THE BRIDLE OR HARNESS.—Referring to an inquiry on this subject in a late RURAL, a friend in Middle Tennessee sends us a plan which has there always proved effectual in the worst cases. A goodly quantity of Cayenne pepper is mixed with a lot of grease and the mixture is liberally applied to the parts of the bridle, harness or other object the brute is accustomed to bite. A few trials of the stuff are generally quite enough for the most inveterate harness-biter.

Miscellaneous.

A PROTECTION AGAINST RABBITS.—A correspondent writing from Fredericksburg, Va., says that he has found by experience that if a plank not less than two feet across, is whitewashed on both sides and fastened in the ground, rabbits will not come within 20 yards, or more, of it.

PROTECTING TREES FROM RABBITS.—A friend writes us from Mount Pleasant, Mo., that he lately saw a very neat way of doing this, which was new to him. The trees were small and were protected by corn-stalks tied closely around them, the stalk having been split open and the pith removed.

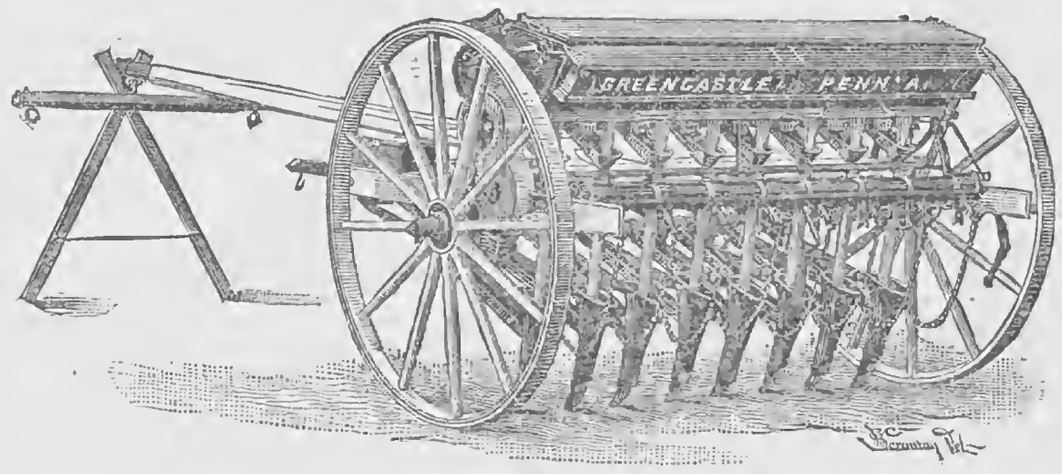
BOOKS, CATALOGUES, ETC.

ANNUAL REPORT of the Commissioner of Agriculture of Georgia—J. T. Henderson. According to this report the year 1880 was not propitious to grain crops, and wheat, oats and rye were almost entire failures. In South Georgia particularly were the crops very poor. The corn crop was short, the average yield per acre being only 9.7 bushels. In cotton the yield was very satisfactory, the condition of the crop being reported 104; the average yield per acre was 541 pounds of seed cotton, or little over one-third of a bale of lint. The yield per plow was five bales of 470 pounds each. Sugar cane also did well, 190 gallons of sirup being the average yield per acre. It must be remembered, however, that in Georgia all the cane juice is made into sirup. The cultivation of upland rice is beginning to attract more attention in Georgia, and quite a large area was planted; 35 bushels of rough rice was the average per acre, though as high as 100 bushels are reported when the conditions were very favorable. Sweet potatoes averaged 110 bushels per acre, but the humid weather was unfavorable to keeping and large quantities were lost. The yield of sorghum was 68 to 88 gallons; ground peas, or peanuts, 23 bushels; chufas, 35 bushels, and hay about two tons. There was a slight increase in the amount of pork cured.

THE AMERICAN HEREFORD RECORD. Vol. I. Compiled by the Breeders' Live-stock Association, Beecher, Ill. This handsome volume of 384 pages 8 vo, contains 2 915 entries of American-owned Herefords, the descent of all of which is traced back through the ten volumes of the English Hereford Herd Book. Fifteen pages at the end of the work give a brief sketch of the history of the Hereford breed both in England and this country. As the first of a series the compilation of this book must have cost a great deal of labor and research. A second volume of the Record has already been begun, for which 1,000 entries have been received. These will be issued in book form under paper covers, without waiting for the completion of a full volume. The charges for entries for the present work have been, for each animal to be entered, $2; for animals to connect with the English Herd Book, 50 cents each. We suppose the same charges will be made for the entries in the second volume.

THE AYRSHIRE RECORD, New Series, Vol. III; American and Canadian Record (old series Vol. IV) published by the Ayrshire Breeders' Association. John Davis French, Editor, North Andover, Mass. This Association now numbers 119 members, and the number of entries in the old and new series of Herd Books is 5,470 bulls and 2,535 cows—total, 7,995. These figures do not include those in the registry of "cattle not tracing directly to importation," which has been discontinued. The North American Ayrshire Register has been consolidated with the Record, so that hereafter there will be only one Ayrshire Herd Book, which will be published under the title of Ayrshire Record; Dr. E. L. Sturtevant hereafter working in harmony with the Association.

USURY.—A pamphlet of 116 pages. This is an anomaly in the way of publications in this country, though in some of the European countries—Russia, for instance—its most characteristic feature is doubtless often noticeable in works of a "compromising" nature. It has neither the name of the author, publisher or printer, a word of preface or a hint outside that in the text, as to its object, which, from a very cursory glance, seems to be to show the worthlessness of usury laws.



THE GREENCASTLE GRAIN DRILL.—From a Photograph.—FIG. 263.

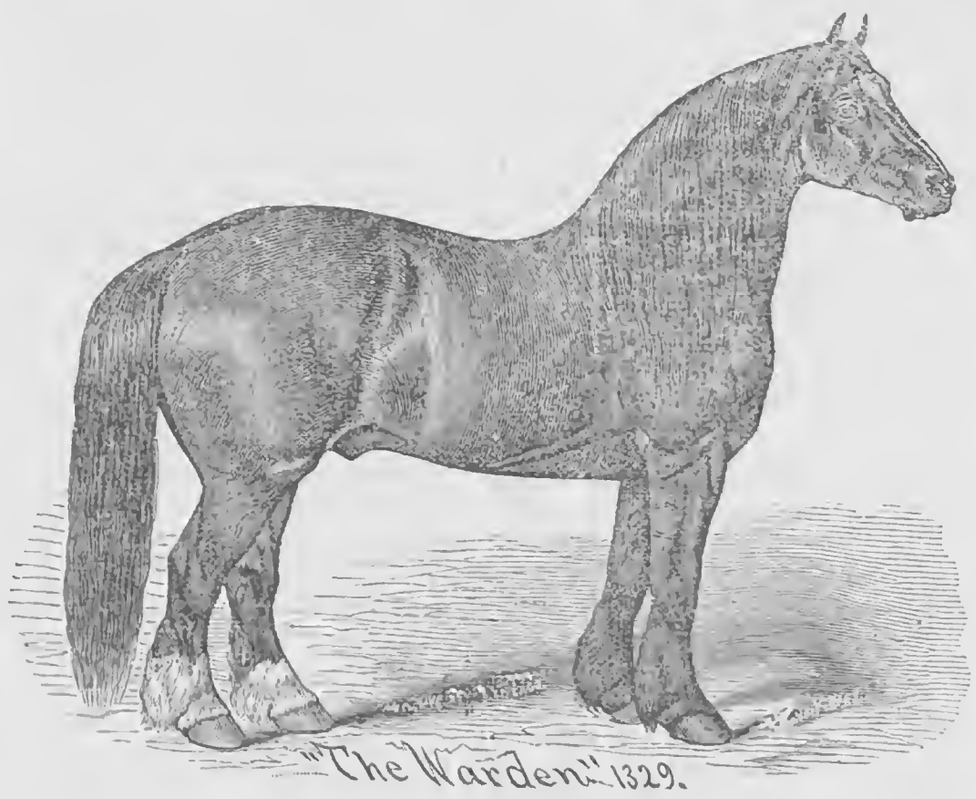


FIG. 264.

THE WISCONSIN CENTRAL RAILROAD LANDS.—A pamphlet of some 60 pages descriptive of the lands for sale by the W. C. R. R., together with an account of various attractive inducements to purchasers. Sent, postage-free, to all applicants, by C. L. Colby, Land Commissioner, Milwaukee, Wis.

A CONTRAST.

I HAVE before me the Ulster County Gazette of January 4, 1800, published by Samuel Freer and Son, at Kingston, N. Y., Volume 2, No. 88. It contains four pages of coarse print, each page nine by sixteen inches inside the blank border. Two pages are devoted to the death and burial of ex-President Washington, to correspondence between the United States Senate and President John Adams, a poem on the occasion by "A Young Lady," some London correspondence, news from Holland and France, "received by the British Packet, Princess Charlotte." These two pages are surrounded by black lines, nearly a quarter of an inch wide, and each column by similar lines of less width.

Forty-two letters are advertised as remaining in the Post Office addressed to persons living in thirteen different places: twelve sheriffs' sales are advertised by Peter Van Broech, Sheriff. There are eight advertisements of real estate for sale, in one of which is a sawmill, "also a stout, healthy, active Negro wench," four merchants' advertisements, one of which is "dry goods and groceries by Samuel Freer," the above publisher.

One man advertises his wife "forbidding all persons from harboring, keeping or trusting her on my account." There are two or three estrays, one of a red bull with P. T. B. branded on his horns.

The correspondence between the United States Senate and the President is dated "United States, January 10, 1799—no place named. There are no subscription or advertisement prices named. No doubt this was a very useful newspaper, well-adapted to the wants of the place and the times, forming a part of the history of both.

In contrast with the above, I have before me the RURAL NEW-YORKER of January 1, 1881, published 81 years afterwards. My object in this comparison is to show the progress that has been, in the meantime, made in this class of literature, as well as to excite the imagination of newspaper readers as to what 81 years more will accomplish. For, in spite of whatever may be said against the indulgence of imagination, there is much of innocent pleasure and even profit in it, as witness the "Siege of Troy," "Aladdin's Lamp" and the "Seven Voyages of Sinbad the Sailor;" the virtues and vices which are therein depicted have embellished the literature of all modern languages.

In the RURAL there are four times as many pages of about the same size, with at least sixteen times as much reading matter, with a very great improvement in type, paper and mechanical execution. And as to the subjects of its contents, it requires very much more labor to describe them than to state what there is of use to the average man, woman or child, that it does *not* contain. If you are engaged in the raising of, or dealing in, horses, cattle, sheep, poultry or pigs, in it you not only find on the subject the concentrated wisdom and experience of the age, but pictorial illustrations of the most approved varieties; and so with fruits, grains and vegetables. And should you fail to find in it everything that you wish to know, from the solving of a problem in Euclid down to the best pattern for a pig-pen, ask the editor and he will be most sure to enlighten you.

Not the least of the advantages to be derived from the possession of the RURAL, is its record of its experiments made on its experimental farm of 80 acres, not for *its* special benefit but for yours; for experiments are costly, and pay, in general, little or no profit above cost to the experimenter. I might also claim great merit for it for its donation of seeds, tubers and plants to its patrons, of new or improved varieties for their (not its) special benefit or profit. It claims to be an agricultural paper, but the man of any profession or calling will surely find in it matter of more value to him than the money he pays for it, if the latter were invested in matters of mere ornament or pleasure. And the woman or child who takes pride or delight in floral ornamentation will find in it information of great advantage.

VIELLARD.

What Others Say.

SPURIOUS BUTTER.—The following is a verbatim report of the speech on this subject by Dr. Lyon Playfair, M. P., in the House of Commons on April 1, as reported in the Scotsman newspaper, as copied by the London Agricultural Gazette. We confess to being heartily opposed to oleomargarine in any shape or form.

Nevertheless it is the RURAL NEW-YORKER'S duty to present both sides of all questions to its readers, and the *other* side seems ably presented below:

Dr. Lyon Playfair said: The member for Wigtownshire (Sir Herbert Maxwell) is naturally alarmed at the competition which British dairy farmers experience by the great development in the manufacture of oleomargarine. This increase arises from various causes, but especially from two, the first being the greatly increased consumption of butter among our population, and the second, the improvements made by chemistry in the manufacture of those fatty bodies which are known to us under the name of butter. The increased consumption leads to an increased supply, and the augmented demand naturally stimulated invention as to new sources of supply. These alarm the baronet and others interested in dairy farming. Not many years ago the foreign butter imported was only 1½ pound per head of the population; now it is about six pounds. The exports of butter from Holland were 20,294 000 kilogrammes in 1869 [A kilogramme is somewhat less than two and a quarter pounds.—EDS.]; but in 1879 they had increased to 36,451,000 kilogrammes. During that time Holland has been largely importing oleomargarine from America. Her imports of fats were only 9,374,000 kilogrammes in 1869, while in 1879 they amounted to 37 461.000 kilogrammes. I understand that 12 000 000 pounds of oleomargarine were imported into Holland last year from America, and in all probability a good deal of this oleomargarine comes to us in the excellent butter, which we get from Holland. This oleomargarine, no doubt, comes to us directly under its own name as a butter substitute, though also in concealed admixture with American, French, and Dutch butters. The acknowledged oleomargarine exported from New York is already half the declared value of butter, though doubtless there is a good deal of concealed oleomargarine in the butter which is imported as dairy produce. The declared value of butter exported last year from New York was $5,179.071 and that of oleomargarine was $2,581,3.7. But the manufacture is not confined to America, for France, Holland, and England are actively engaged in making oleomargarine. Undoubtedly this artificial butter is rapidly pushing inferior butter out of the market.

Oleomargarine simply consists of butter fats got from an ox instead of butter fats from a cow, and therefore is simply one form of agricultural product interfering with another agricultural product. The fats which constitute butter, for the main part at least, can be got from different sources, and are not even restricted to animals, for such fats are found abundantly in plants as well as in animals. The chief solid fat in butter is the principal ingredient in palm oil, while the chief liquid fat of butter abounds in olive oil. Even the soluble aromatic fats which give to butter its peculiar taste and flavor are found abundantly in cocoanut oil. If we could extract butter fats economically from vegetable oil, and give a sound, healthy butter from them at a cheap rate, it would be a matter of indifference to the public whether the butter came from the cow or from the vegetable.

Let me here give an illustration of my argument. Milk contains four pounds of cheese for every 100 pounds of milk, but peas and beans contain 20 pounds of cheese for every 100 pounds. The Chinese, who are a great experimental nation, actually do make cheeses from peas and sell them in their markets. These cheeses are highly esteemed in China, but to our palates are insipid because they do not contain butter fats. But I look forward to the day when cheeses will be made from beans, peas and lentils, and after being mixed with good oleomargarine may form palatable and and very economical cheeses. Would the honorable Baronet stay the progress of chemical invention and prevent the manufacture of such cheeses from peas simply because they would interfere with dairy produce? Now, to come to oleomargarine. That substance, by purifying the more fusible parts of beef suet, and separating from it the less fusible fats and cellular tissue which exist in all fats, practically gives true butter fats, with the exception of about five per cent. of aromatic soluble fats, which give to good butter its delicious flavor, but that five per cent. makes all the difference as regards flavor and taste between good oleomargarine and good butter. The two cannot come into competition any more than inferior American cheeses will compete with our best Cheddar and Cheshire cheese. The American cheeses do knock our bad cheeses out of the market, and so certainly good oleomargarine will and ought to drive our bad qualities of butter out of the market. Much of the butter sold to the poor is reduced in nutritive value by salt and water, and readily becomes rancid. Such inferior butter ought to be substituted by oleomargarine, which, if carefully prepared, has little tendency to rancidity. Although oleomargarine can't compete with good butter, yet I am sure it will so thoroughly compete with bad butter that dairy farmers will be compelled to improve the quality of their butter. Unless thorough cleanliness is observed in the treatment of the milk of butter, the aromatic fats, which give superiority to good butter become the source of rancidity to inferior butters, and render them positively unwholesome. But even when butter is not rank, it is so often brought into the market adulterated with so much salt and water that its nutritive value is much deteriorated. Natural butter may contain from 12 to 16 per cent. of water, and from one to two per cent. of salt. But many of the inferior butters contain 20 to 25 per cent. of water, and from five to ten per cent. of salt. Such butters are a fraud upon the poor, and are far inferior in nutritive value to well-prepared oleomargarine, which rarely contains above 12 per cent. of salt. It is with poor butter of this kind that oleomargarine will and ought to compete. Bad, rancid butters are quite as unwholesome as bad specimens of rancid oleomargarine; only it is rare to see oleomargarine rancid because it is manufactured on a large scale, and with the care which large operations receive by skilled superintendence.

As to the relative wholesomeness of good butter and good oleomargarine, I do not think there is anything to choose between them. It has been said that, as oleomargarine is not heated above 120° Fahr. it may contain the the germs of disease in the animals, but so may the fats constituting butters which have not been heated above 99° Fahr. in the body of the cow. So far as we know, when the fats derived either from the cow or the ox are not rancid they are equally wholesome. In both cases when they are rancid they are equally unwholesome. Surely, carefully prepared, wholesome butter fats called oleomargarine are much better for the poor at 1s. a pound than badly prepared and dirty butters at 1s 3d. or 1s. 6d. per pound. How does the Hon. Baronet propose that Government is to carry out his resolution? The law already provides that an article of food sold under a name to which it is not entitled is punishable at law. Oleomargarine should certainly be sold as artificial butter, and not as dairy butter. But how are you to enforce the law in this case, when the products of the cow and of the ox only differ in five parts out of the hundred. I should be very sorry to decide upon a sample of artificial butter, whether it was from the cow or ox; and when it is used for admixture with dairy butter the case is still more difficult. Very few chemists would be prepared to swear that a butter made half from the cow and half from the ox was unquestionably an adulterated article. It is not like chicory and coffee, for chicory is chicory, and coffee is coffee. But oleomargarine and butter are practically identical, except as to their source and the absence of five per cent. of aromatic fat which probably before long may be added from cocoanut oil or other sources. The resolution goes on to say that such artificial butters as are hurtful or dangerous should be prohibited altogether. Certainly, rancid oleomargarine is a nasty and hurtful compound, but not any more so than nasty and rancid butter which abounds in many markets. Both are unfit for human food, although both may be purified by well known processes. The farmer has a much better method than legislation to protect his dairy produce from cheap substitutes for butter. Let him cultivate improved methods of preparation, strict cleanliness, sufficient washing of the butter, and fair treatment. Let him send such butters to the market without being laden with salt and water to increase the weight, and his superior and well-flavored butter, with little tendency to rancidity, will keep its own position in the markets in spite of the equally salubrious but less well-flavored oleomargarine, which will certainly drive bad butters out of the field, but cannot compete with really good butters.

AT a recent meeting of the Western N. Y. Farmers' Club, as reported in the Rural Home, Mr. Fowler said that shippers were paying $1 per bushel for Burbanks and but 90 cents for other potatoes. Quality fair, but not quite equal to Early Rose. Mr. Wall said he could grow large crops of Burbank, but couldn't eat them. The introduction of self-binding reapers, it was remarked, would work a revolution in harvesting wheat. Few farmers will themselves own a self-binder, but men who do will go round the country taking jobs, as they now do at thrashing, with the disadvantage for harvesting that it mostly comes all together, and must be done all at once or loss will follow.

WE confess to a sort of belief in "luck," says the Agricultural Gazette (England), in the sense that even the most careful managers are apt to suffer severe losses, and careless managers who neglect all the recognized rules are sometimes able to flaunt their good luck as an argument against the sound advice of experienced men. Still we may be sure that in the long run good management has the pull over bad. Liberal feeding upon cake and corn pays in three ways; (1) in making our sheep worth more money; (2) in keeping a larger number of them alive; (3) by improving the land. The lives saved will alone pay for a very considerable portion of the cake bill.

TREATMENT OF A CHOKING COW.—Mr. G. W. Hoffman remarked to the Elmira Farmers' Club that he had that day a cow that got choked by a turnip that resisted the usual treatment—pressing upward with the thumb and fingers below the obstruction. He got a piece of inch and a quarter rope and soaked it thoroughly in warm water, then in cold water to stiffen it, wound cloths at one end, and used that to push the turnip down. The trouble was soon ended and the cow returned to her mess.

President McCann asked why was the rope better than a broom stick?

Mr. Hoffman replied that it was more pliable and yielding. He prefers to effect the dislodgment of the offending substance by pressure applied externally. This is done by grasping the gullet just below the obstruction and squeezing it upward. In most cases quick relief may be obtained by this method and it has the merit of being free from risk. But in the case referred to it was not effectual. He even resorted to the harsh treatment of trying to mash the turnip by placing a block at one side and striking a blow against the turnip on the other side, but without effect.

President McCann said there was an element of cruelty in that treatment—so there is in pushing the obstruction down with a stick; yet he had to employ that means with a heifer that got choked on an apple and was badly bloated in consequence. She frothed at the mouth, and was nearly gone, but the stick shoved the apple down, and the heifer was very soon ready to resume eating.

Mr. Hoffman said he had seen that tried on a cow—she died.

Mr. Compton said his father had one treated by that plan—she died.

DR. J. B. LAWES, of Rothamsted, is writing a series of articles for the Agricultural Gazette of London, under the general title of "Fertility." From the latest of these we quote the following as of special interest to our farmers:

FIRST of all, and this is a most important point, the United States farmer himself is usually well educated and intelligent; he is both owner and occupier of the soil, and does as much as possible of the work of the farm himself, employing for the purpose the most improved labor-saving machinery; he is lightly taxed, has cheap modes of transit, and, above all, is in possession of an almost unlimited extent of untouched fertility. These circumstances all combined reduce the cost of growing grain almost to a minimum, and the result enables him to deliver his wheat at the doors of the owner of the land, in some parts of Great Britain, cheaper than it can be raised in the adjoining fields. In a word, they enable him to regulate the price of grain throughout the world.

THE idea that the fertility of these (our new) soils must shortly come to an end, or that grain crops cannot be produced at the present prices is altogether illusive.

The stock of nitrogen in immense areas of the United States soils must be competent to yield crops, equal to those given in the table, for a long time, and even when they begin to fall off, the residue of nitrogen may still be sufficient to allow of a fresh development of fertility, by the employment of some cheap mineral manure, such as plaster or phosphate of lime; if this be so, the necessity of employing so costly a substance as nitrogen may not be apparent for two or three generations yet to come.

Before this period arrives the United States farmer will have become so well acquainted with the action of manures, that the profit or loss attending their application will not be a question of chance, but one subject only to the contingency of favorable, or unfavorable seasons; a contingency from which it will be impossible to escape.

THUS says the Nebraska Farmer:—The prospects for a crop of Winter wheat in Kansas, Missouri, Iowa, Illinois and Michigan are the poorest for years, and the indications are that wheat will rule high during the next year. So far as Kansas and Missouri are concerned this is very decidedly opposed to nearly all reports we have seen with regard to the outlook for wheat from our many correspondents there.

ENSILAGE.—Says the agricultural editor of the N. Y. Times:—One of the most conspicuous features about the present excitement in regard to ensilage is that the most prominent writers about it have all some private axe to grind in the shape of hooks, or seed, or plans, or implements connected with the process, to sell. Precisely what we think about it is this, that if it is a good thing it will keep, and there is time enough to try it when it is known to be good.

WIRE-WORMS.—"I planted my corn in the usual way, but in one row I put wood ashes, in a second land plaster, and in a third common salt," says a correspondent of the N. Y. World. "There was little difference, if any, in the first two, and these I had done nothing with, but where I put the salt about nine-tenths of the corn came up well. So I concluded to doctor the whole piece, and sowed a good coat of salt and stirred the ground well, and then sowed another coat not quite so heavy. I then marked out and planted my corn and it gave me a good stand, something I never had on that piece before. It made an average yield of corn and put an end to the wire-worms."

DR. KEDZIE says that he believes the cheapest and easiest way to bring up a run-down farm—one that any and every man can use—is by green manuring. . . . . He also remarks that some one has wisely said, "In building a house, build as if you expected to live forever." The same rule is emphatically applicable to farming. Manage your farm as if you expected to live forever. Whatever treatment will injure your farm in future time, avoid in the present time. . . . . Can a man be rightly said to be "on his legs" again when he has sold his horses and carriages for the sweet sake of his creditors and is compelled to walk? . . . . . Don't forget that the celery plant is a semi-aquatic. Give it moisture if you would have crisp, sweet stalks. . . . . It is foolish to grieve over what can't be helped and still more foolish, because needless, to grieve over what can be. . . . . Some conceited folk think they fill a large place in the public eye when in reality it is all in their own. . . . . The RURAL NEW-YORKER will this year send to its subscribers not *less* than 868 pages—all for two dollars. This is not "What Others Say," however; it is what WE say. . . . . It is time to make the second planting of peas, radishes, sweet corn and lettuce.

Everywhere.

RURAL SPECIAL REPORTS.

CAN., Emsdale, Muskoka, Ontario, May 7.—We have had a very fine, dry Spring, but owing to the wind keeping in the north it has been cold. The rivers are very low and, unless we get rain, the lumbermen will have hard work to get their logs down. The farmers in this neighborhood have all their grain sown with the exception of barley. I planted my White Elephant Potato on the 25th of April. I cut it to single eyes, eight sets, total weight two and one-quarter ounces; planted about 10 inches apart. I also planted eight sets of Early Rose (single eyes and same weight) at the same time, so as to be able to tell which does the best in this climate. H. R. D.

[This is an excellent way to test a new kind. —EDS.]

CAL., Carpenteria, Santa Barbara Co., April 29.—The weather is just now delightful, but it has been rather moist and gloomy for this country for some time, but not cold enough to be disagreeable or to keep vegetation back. Land is in fine condition to plant corn and beans—never was better at this season of the year. Planting has commenced. Hay has been cut here and there, so the wheel keeps rolling and there is little rest for the farmer. Apricot trees are well filled with growing fruit and we have good promises for most other kinds of fruit. O. N. C.

DAKOTA TER., Marion Junction, Turner Co., May 2.—Snow blockade and no trains from Feb. 1, to April 17. Winter and last snow storm ceased April 10, with snow nearly two feet deep. Thaw began April 13. April 18, railroad was washed out in very many places in Northwestern Iowa and Dakota, and every water-course was an unfordable river. Snow all gone by April 25. Land now in fine condition except on bottoms. Wild grass starting rapidly. "Dry" runs empty; small streams falling fast. Large streams will require a week yet to get within their banks. No trains since April 18, and many new settlers of last season west of here, who depend on seed wheat to be brought from the East this Spring, find themselves sadly behind. Many who went East last Fall to spend the Winter have not yet been able to return to put in their crops. Prospect excellent for those who were ready for seeding. New country. No fruit nor Winter wheat. Stock rather thin, owing to the extremely long Winter. J. B. E.

ILL., Holt's Prairie, Perry Co., May 4.—We, here in Egypt, are now very busy planting corn, about one-third of which is planted. We are late, as corn should all be up now. We are having a cold, drizzly rain to-day, with the thermometer at 63°, which will rot the corn planted if it continues. Prospect gloomy. Wheat badly frozen out—a light yield inevitable. Owing to short crops of corn, hay and oats last year, our stock have come out of the long, hard Winter thin in flesh, and, as feed is very scarce, the grass on our meadows and pastures has come to the rescue most opportunely. Wheat is worth $1 per bush.; corn, 50c. to 75c.; oats, 35c. to 40c; hay, $10 to $12 per ton; potatoes, $1 per bush. R. M. D.

ILL,, Rockford, Winnebago Co., May 8.—Wheat is nearly all killed except where protected by snow-banks. Raspberries were badly frozen. Oats are about half sowed. Butter is worth 20c.; corn, 38c.; oats, 30c.; potatoes, $1.10 per bushel. W. D. H.

IOWA, Shell Rock, Butler Co., May 1.—We are having as early a Spring as could be expected after having had so severe a Winter. Stock are looking first-rate and will be turned out to grass in about a week, if grass grows as rapidly as it has for the last two weeks. Seeding is nearly finished and some pieces are up, and look splendid. Wheat has been almost a failure for the last two years owing to the devastation of the Chinch bug; many pieces have not paid the expenses of harvesting, but we are in hopes the pests will not bother us this year. Flax seems to be the main crop this season. The yield last year was thirteen bushels to the acre. By the way, there would be a splendid opening for some smart, energetic capitalist who wished to erect a paper mill at this place and thus amass a snug little fortune. In this way, thousands of tons of flax and other straw that will be burned, could be made to pay a handsome profit to the farmer and manufacturer. There is good water power. Who will be the lucky man to build the mill? Winter rye looks well and will be a pretty fair crop. Corn, 25c; wheat, 80@90c; potatoes, 50c; butter, 13c; eggs, 8c; hogs, $4 75@5. W. H. B.

IA., Wellman, Washington Co., April 25.—We had a long, cold winter and plenty of snow from Nov. 15, to April 15. Spring work will begin one month later than last year. Fall wheat was all frozen out. But little Spring wheat will be sown. Oats and corn are the farmer's main hope here now. Cherries are all killed. We shall have about half a crop of other small fruit. Apples are not killed. A new creamery is being built near this place. We need something of that kind here. Hogs are worth from $5 to $5 30; wheat, 70c. to 90c.; per bu.; oats, 30c; corn, 29 to 31c.; hay, $8 to $10 per ton; butter, 13c. per pound; eggs, 10c. per dozen. E. B S.

IA., Utica, Van Buren Co., May 3.—Some grain has been sowed here but not much, as the ground has been too wet. The weather is fine now and farmers are busy putting in oats and "breaking" for corn. I don't think we shall have many apples this year; last season we had a large crop. R. J.

KANSAS, Walnut, Crawford Co., May 6.—Wheat, of which quite a large acreage was sown last Fall, is looking very fine, and the farmers are hopeful of a good yield of this cereal. The extremely cold Winter just passed injured some pieces of wheat that were sown broadcast, as the freezing and thawing raised the roots out of the ground and left them so exposed that the wheat was entirely killed in patches. Corn will be nearly all planted this week, and it is now "all work and no play" with a farmer, as we all know by experience that nine times out of ten the early planting insures the best yield. The most terrific rain and hail storm that I ever witnessed swept over here yesterday, doing much damage to window glass, fruit blooms and gardens. The hail continued to rattle down for 30 minutes, making it almost deafening in a house. Some of the hailstones were as large as walnuts. In my garden the gooseberries, about one-third grown, were nearly all cut off, and garden vegetables, such as beans, cabbage and lettuce, were almost ruined. The young shoots on my grape-vines, six or eight inches long, were cut and broken off in a shocking manner. Our druggist gathered three pailfuls of the hailstones to use in his soda fountain. The streak of hail was not more than a mile and a-half wide, coming from a little north of west. I hope to see more from our Western farmers in the RURAL NEW-YORKER, giving their experience in agriculture, horticulture, stock, etc. The seeds from your distribution are all planted. The White Elephant Potatoes, Branching Sorghum and oats are up and looking very nice. B. G. S.

KAN., Sterling, Rice Co., May 5.—We have had a glorious rain, succeeding several fine showers, and everything looks prosperous. Wheat looks fine; corn is coming up; gardens are prospering, and the peach and cherry trees are in bloom. J. W. M'C.

KENTUCKY, Paducah, McCracken Co., May 2.—The weather is very pleasant to-day after a long, cold Spring and Winter. My three-year-old peach trees were frozen just above the ground; they are entirely dead; although they were full of bloom and the leaves put out, they soon began to look sickly and on examination I found they were winter-killed. We have a fine prospect for a crop of strawberries Blackberries are killed. There will be a light crop of apples and peaches here. A smaller acreage than usual of wheat was put in last Fall on account of wet weather, and what was put in looks bad. G. W. R.

MICH, Eastport, Antrim Co., May 2.—We have had a very severe Winter—any amount of wind, snow and extremely cold weather, with but very little change from the 1st of November until the 1st of March. Since then we have had pleasanter weather than people generally look for during the months of March and April. We have not had any rain to speak of this Spring. The great depth of snow has been gradually wasted away by the sun until it is nearly all gone, a little being still left in some places in the woods. Fall wheat was injured somewhat last Autumn, either by some insect or disease, so that it withered and became thin on the ground. What survived was badly smothered in places by the formation of a hard crust on the snow. One could travel over it with a team and loaded sleigh. People have just begun Spring work. The ice is not out of Grand Traverse Bay yet, which makes the weather quite cool. Fruit buds appear to be all right, with the exception of pears, which seem to be partially injured. Raspberries, blackberries and the young stock of peaches are winter-killed to some extent. M. M. C.

MINN, Warren, Winona Co., May 2.—Seeding Spring grain just done. Weather very good. Earth quite moist from the deep snow of last Winter. No rain yet except light showers. Grass and all plants growing fast. Season, medium late. Rivers in all parts of the State rising fast. Inundation imminent in low lands. Wheat, 95c.; corn, 45c.; oats, 35c.; barley, 90c.; potatoes, 90c.; butter, 20c.; eggs, 10c.; hay, $10 to $12 and scarce. B.

MO., Pleasant Mt., Miller Co., May 2.—Farmers are through sowing oats. Owing to the late season the acreage was not as large as it otherwise would have been. Farmers are very busy planting corn. Owing to the late opening of Spring this will hardly be finished until the last of this month. Wheat, taken altogether, looks fully as well as usually, and unless some unforseen calamity occurs, will make a good crop. Locusts are making their appearance through the ground. We shall have some fruit, though not a full crop by any means. N. G. S.

NEB, Pleasant Hill, Saline Co.—We have had a very severe Winter here, but Spring has set in in earnest. Our wheat and oats are already sown and look very promising. W. A.

N. J., Ocean Co., near Barnegat Bay, May 6.—To give an idea of the late season here this year, I note that the flowering shrub forsythia began to bloom April 20, peach trees, 27, pear, cherry, Pyrus Japonica, and shad-bush, May 1. Peas up April 20, and now six to eight inches high. Radish and lettuce almost large enough to pick, and *one spear* of sweet corn two inches high. Pie-plant large enough to pull April 25, and asparagus to cut on the 30th. The wind for the past seven days has blown lightly from northeast to southeast, but the weather kept fair until the night of May 5, when it began to rain gently, continuing through the 6th. This is much needed for our light soils, as it has been rather dry for ten days past. On the nights of 3d and 4th of May there was a light frost which has done no injury. Rye sowed last September for soiling is 18 to 24 inches high and will be soon large enough to cut for our cows. A. B. A.

N. Y., Clifton, Monroe Co., May 9.—The first strawberry blossoms appeared here yesterday, also the first cherry blossoms. Fruit buds are not seriously injured here. The Cuthbert Raspberry may be called hardy here; it comes out better than I expected. C. A. G.

TENN., Thompson Station, Williamson Co., May 2.—In this portion of Middle Tennessee farmers are nearly, or quite, two weeks later than usual in getting in their crops—cotton and corn, of course—which delay has been caused by continual wet weather preventing us from getting our plowing done in season. Few of our farmers are more than half through planting. Very little tobacco is raised in this or the adjoining counties—too little money in it. We ought not to grow cotton, but it is always ready money when ready for market, and a negro in Middle or West Tennessee thinks he cannot live unless he has a cotton crop to sell about Christmas time; and, in truth, most of our white farmers entertain the same notion. This county is one of the finest countries in the world for stock raising; and it will not be many years until that industry will be the leading one of our people, especially of the more enterprising and progressive portion. Our wheat is looking fairly promising only, having come through a hard Winter and cold, wet, backward Spring in a better condition than was expected. The acreage of wheat for Middle Tennessee is, however, considerably less this year than usual, owing to Winter setting in and staying with us nearly two months earlier than has been the case for years before. My Washington Oats are up and looking as well as could be expected after so much rain. I shall stir the ground in a day or two. The Rural Branching Sorghum was planted to-day in a very rich mellow place—an old fence row [It does not *need* rich ground. Eds]. My white Elephant Potato is doing splendidly *above* ground; how it is under the surface I cannot tell—not having grubbed there as yet. I am only fearful that some of our thieving negroes will do that work for me, and shorten or destroy my crop. W. H. C.

TEXAS, Dayton, Liberty Co., May 1.—Although the season is about two weeks later than usual, corn and cotton are nearly all planted. Our Winter was very severe, and yet our prairie cattle have come out unusually well. I do not think the loss will average over *one per cent* This is somewhat different from the Dakota outlook, as we read of it in the newspapers. Oats are now being harvested. I am now eating Early Rose potatoes every day. I think it would have done the editor's heart good to have seen my sorghum plot. The garden is 200 feet long, and I have two rows planted about four feet wide, the seeds about six inches apart. It is as smooth as a billiard table, and as I have had no other kind, and there is no other in my neighborhood, the outcome is bound to be true to name. G. G.

WASHINGTON TERRITORY, Cedar Creek, Whitman Co., April 21.—This has been the earliest Spring we have had for a long time. Although Winter commenced about the 20th of November, it broke up about the 15th of March. We began seeding about the 20th of that month and now the farmers have almost finished. Winter wheat looks fine, but very little has been sown here. Small fruits were not injured except blackberries. The prospects for a good crop are first-rate. J. L'D.

WIS., Dodge's Corners, Waukesha Co., May 6.—Spring is at least a month behind time this year. Spring wheat is not all in yet. Winter wheat, unless in a sheltered situation, is injured badly. Many have plowed it up and are sowing the ground to Spring wheat. A great many early potatoes are raised here for market. Some have put in as many as 20 acres already. We are in the great "fine-wool" region of Wisconsin. Yesterday was the 16th annual shearing of full-blood Merinos. There was a fine show of sheep, probably no better exhibit of thoroughbreds was ever made in the United States. But few were shorn, on account of cold weather. The heaviest clip was 27 pounds. Hundreds assemble every year at this annual gathering. Reporters from Chicago and Milwaukee and other neighboring places are always present. A sumptuous dinner is provided by the ladies and a happy day is spent by all. It has come to be a day looked upon by all, far and near, as the Spring festivity, as much as the "fairs" are the Fall festivities. Dairying has hitherto received little attention, each farmer being content to keep eight or ten Short-horns or Jerseys as the fancy of each might suggest, for the all-absorbing interest has been sheep But this year there is a little awakening on account of a creamery that buys the cream of the farmers and makes high-priced butter, so that dairying promises to be as remunerative as sheep raising. Many are losing young sheep with "grub-in-the head." F. C. P.

The Querist.

ANSWERS TO CORRESPONDENTS.

Introducing Italian Queens to Common Black Bees.

C. W. W., Lowville, N. Y., asks, 1, can an Italian queen be introduced into a colony of common black bees; 2 where and of whom can Italian queens be purchased.

ANS.—1. Yes; but be sure, in the first place, that no queen is in the hive into which the new queen is to be introduced. Italian queens may be introduced in various ways, but that recommended by Professor Cook is as good as any. Put the queen into a wire cage, made by winding a strip of wire-cloth three and a-half inches wide, and containing 15 to 20 meshes to the inch, about the finger. Let it lap half an inch; then ravel out the laps and weave in the ends of the wires to form a tube. The ends of the tube may be pinched together after the queen is inserted. Now place the cage, with queen, in the hive between two adjacent combs containing honey upon which the queen may feed. After 48 hours smoke the bees and open the queen's cage at the ends, but do not remove the cage. If the bees, on entering the cage, attack the queen, re cage her for another 48 hours. It is well to let some honey drip on the queen as soon as the cage is opened. If an imported queen is to be introduced into a new colony of young bees, smoke the bees well, sprinkle them with sweetened water and the queen with honey, and introduce her immediately. 2. We would advise you to consult G. M. Doolittle, Borodino, N. Y., J. G Bingham, McGrawville, N. Y., or Chas. Dadant & Son, Hamilton, Ill., on the purchase of Italian queens.

When to Castrate a Colt.

W. H C., Thompson's Station, Tenn, asks, what is the most suitable age to castrate a colt, horse or mule.

ANS.—The proper time for castrating a colt will depend a good deal on its development; for the longer he remains uncut, the more is the fore quarter developed, and especially the head and neck. If these parts are already well developed, therefore, the operation should be performed early, while, if they are poorly developed, gelding should be postponed until later; but in no case is it wise, as a rule, to defer it beyond the age of twelve months. The longer it is put off, up to this period, the more of the natural vigor and style of the stallion does the animal retain. From the middle of May to the first of June is generally found to be the best time to perform the operation in the North, and about the time the young grass gives a full bite, in the South. What is true of the horse, is true of the mule in this connection.

Miscellaneous.

J. C. H., Richfield, Utah, asks information about a large number of papers without naming the place where they are published.

ANS.—We cannot undertake to hunt up information of this sort. It is of use only to an individual inquirer, and to obtain full particulars would cost us far too much time—which is money. Whenever the information sought is of general interest, we spare neither trouble nor expense to supply it, and even for each individual inquirer we are willing to go to a fair amount of trouble. In the present case neither we ourselves nor the American News Company can furnish any more of the information sought than the following:—Papers treating of "turning" and wood-working: Junior American Mechanic, monthly, 75c., 1434 Hanover St., Philadelphia; Scientific American, weekly, $3 20, 37 Park Row, N. Y. No information with regard to other papers inquired about in this connection. Papers treating of mining:—The Mining News, daily, $6, 15 Frankfort St., N. Y.; Mining Record, weekly, $3, 61 Broadway, N. Y. Papers treating on sanitary matters:—Herald of Health, monthly, $1. 15 Laight St., N. Y; Foote's Health Monthly, 50c., 129 East 28th St., N. Y.

J. P. C., Dubuque, Ia., asks, 1, what is the difference between flax-seed and linseed; 2, why is foreign flax-seed more high-priced than home-raised; 3, could not the latter be made as good as the former by cultivation.

ANS.—1, Flax seed and linseed are two words for the same thing. 2, Because greater care is bestowed in raising a better article, to say nothing of the cost of bringing it here, etc. 3, Probably, yes; but it is doubtful whether the extra care would "pay" so long as labor here is so much dearer than in Ireland, Holland, Belgium or Russia, whence almost all imported flax seed comes.

W. H. C., Thompson Station, Tenn., asks, 1, how to grow late cabbages for Winter use; 2, what varieties would be most likely to thrive in that locality: 3, when should the young plants be set out. He has already several young cabbage plants set out, and he inquires, 4, if they thrive well, is there any way of preserving them for Winter use.

ANS—1 They are grown the same as early cabbage. 2. Drumhead, Flat Dutch and Drumhead Savoy. 3. Sow in this latitude about middle of May, farther south they may be sown earlier. 4 Plant out in July, 5. We do not think there is.

J. C. H, Sevier Co., Utah, says that they have been blessed with tree peddlers from Kansas. They sold a good many trees at high prices. They said they procured their stock from the biggest nursery in the United States, viz, the Fairmount Nursery, of Topeka, Kansas. He asks if there is such a nursery.

ANS—We have not heard of it before.

N. W. R, Mount Vernon, N. Y., asks, what is the best time in the year to clear a piece of ground of a thick growth of brush and briars which have covered it probably for twenty years. He has been told that if the job is done in Winter, the roots will be killed "entirely."

J. W. D., Floresville, Texas, asks where can he get a good book of architectural designs and its price.

ANS—Bicknell & Comstock's Cottage and Villa Architecture, price $6, published by B. & C., 198 Broadway, N. Y.; Reeds "House Plans," $1 50, American News Co, N. Y.; Palliser's American Cottage Homes, $5, published by Palliser & Palliser at Bridgeport, Conn., are good works.

"*Subscriber*," *Genesee, N. Y.*, asks for a remedy for a cow that leaks her milk.

ANS—The only remedy we know of for this failing is to milk the cow often—say three times a day—so as to relieve the teat of pressure until it has become strong enough to bear it.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, MAY 21, 1881.

A farmer friend and neighbor, who has known the Rural Farm for many years, and who is quite familiar with the field upon which we have planted our main crop of corn, was greatly surprised upon being informed that, except upon one acre, no fertilizer of any kind had been used. "How many bushels of shelled corn will you give us per acre," we asked—"40 bushels?" "No," he replied, "not 25."

Small Savings — Small Losses.—The man who saves something every year is on the road to prosperity. It may not be possible to save much. If not, save a little. Don't think a dollar or a dime is too small a sum to lay by. Every body knows how little expenditures get away with large sums. But few seem to know that the rule is one that works both ways. If a dime spent here and a dollar there soon make a large hole in a man's income, so those dimes and dollars laid away soon become a visible and respectable accumulation. In this country any man may make himself independent, or keep himself under the harrow for life, according as he wastes or spends his "small change." How many things do individuals and families buy that they do not need, or cannot afford. Think twice before you spend that small coin. Don't be stingy or mean, but also don't be foolishly self-indulgent. The self-indulgent person is far more likely to be ungenerous than the self-denying one. The money wasted on hurtful things alone—the drugs and medicines we mingle with our diet in the forms of tea, tobacco, alcohol and the like,—stand on the very threshold of prosperity, and bar the way of thousands to a home in their old age.

THE GREAT COTTON EXHIBITION.

The success of the great exhibition of cotton and other agricultural products of the South, to be held at Atlanta next October, seems already assured. Thus far, $200,000 have been raised toward meeting the expenses of the undertaking, and advices from all the chief Southern cities tell of enthusiastic co-operation everywhere. Last Monday 300 men were set to work on the main building, which will occupy the race-course in Oglethorpe Park, and be 750 feet long by 90 wide with a transept 500 feet long. This will be devoted to exhibits of textile fabrics and the machinery for producing them. Another building 250 feet long and 100 feet wide will be filled with machinery for preparing sugar, rice and similar products, and a still larger one will contain all varieties of tobacco, its products and the machinery used in connection with it. Another large structure will be devoted to a comprehensive display of the agricultural produce, minerals and woods of the South. An annex to the main building will be known as the Foreign Department, and will be a bonded warehouse under charge of a Treasury Special Agent, for the display of foreign exhibits on which the proprietors do not wish to pay duty. Thirty acres of the park have been laid out in half-acre lots and assigned to as many different planters for competitive trials of skill in the cultivation of cotton. Great efforts have been made to make this a display of every variety of cotton in the world, seed having been imported from Egypt, Guinea, British India and other cotton-cultivating parts of the globe, sometimes at great expense, a single half-pound of one rare sort having cost $200. This plantation has already been seeded down, and is expected to be a peculiarly attractive exhibit. If this enterprise shall be carried out as now designed, it will be the most important measure accomplished by the South since the war, and as a stimulant of fraternal feeling and good-will, it must be a source of gratification and advantage on both sides of Mason and Dixon's line.

INJURY TO RARE PLANTS BY THE PAST WINTER.

With regret we are obliged to state that the Japan Maples, or such of them as we have been testing at the Rural Grounds—have not proven hardy during the past Winter. We regret this the more, inasmuch as the Rural New-Yorker has made a pet of these incomparable little trees and has praised them from the beginning as their beauty richly deserves. We took for granted that they were hardy, having been told years ago that trees, ten years old perhaps, in suburban grounds of New York city had never been harmed. Upon careful examination we find that the Purple dissected-leaf Japan Maple (Acer polymorphum dissectum atropurpureum), really the handsomest of all, and the Various-colored (A. p. versicolor) are killed back to half their hight. The Red-margined Japan Maple (A. p. roseo-marginatum) is killed to within five inches of the graft; while the species, Acer polymorphum, is killed to the ground, and we are not confident that even the roots are alive.

We have also to report that Retinispora pisifera, which has never before been harmed here, and R. plumosa aurea (the Golden-plumed Japan Cypress of which so much has been said) are seriously harmed half way to the ground; while the beautiful Golden Pine which we have alluded to as the finest variegated evergreen in cultivation, is harmed in many parts, though the buds—we are glad to say—are intact.

We are inclined to think of evergreens, as of raspberries, that there is no kind which may be called perfectly hardy. They may stand many seasons without injury, but, sooner or later, a year will come to kill or disfigure them. Not so, however, with deciduous trees, some kinds of which are absolutely hardy, if that word can be said to have any well-defined signification. But among these the Japan Maples—as they grow at the Rural Grounds—should not be placed, though we doubt not they will endure in this climate, eight years in nine.

COMPETITION IN FREIGHT ROUTES FROM THE WEST TO THE SEA.

New Orleans reports that a grain fleet of 29 steamships and 19 sailing vessels left her levee in April, carrying out for foreign markets an aggregate of 1,427,200 bushels of corn and 566,000 bushels of wheat, making the grand total export thence from September 1, 1880, to May 1, 1881, 5,906,600 bushels of corn and 4,267,300 bushels of wheat, against 6,483,300 bushels of the former and 2,713,100 bushels of the latter for the corresponding eight months of 1879–'80. This is an aggregate increase of 977,500 bushels of grain; quite a respectable increase, to be sure; but hardly large enough to justify the cry of alarm raised within the last week by some of our great dailies about the danger to the commerce of this port threatened by the diversion of the exportable grain of the West from the route to market by way of the Atlantic ports to that by way of the Mississippi.

Upwards of a month ago we told of the departure from St. Louis for New Orleans of 680,000 bushels of grain in one day—April 9. Our city dailies seem to have only lately heard of this shipment, as some of them have, within the week, printed the figures in large capitals at the head of alarmist articles on the prospective decadence of the commerce of New York. We wonder whether their anxiety that the legislature should declare the Erie Canal free, had anything to do with their fear for our commerce. There is no doubt, however, that shipments of Western exportable grain by way of the Mississippi will continue to increase in any event with the enlarging area under cultivation in the West; and this increase will be rapid and to the detriment of the commerce of Atlantic ports, so long as the railroad charges to the seaboard are so exorbitant as they are at present. Last Thursday Mr. Joseph J. White, of the Committee on Legislature of the Board of Trade and Transportation of this city, presented to that body a report of his personal investigation of the transportation business of the United States. According to this report grain can be shipped from St. Louis to Liverpool, *via* New Orleans for 17 cents per bushel, while the rate *via* New York is 29½ cents. The rates from St. Paul, Minnesota, too, show a difference of 15½ cents per bushel in favor of the Crescent City. Unless railroad charges on the surplus agricultural products of the West on their way to tide-water, are greatly reduced, New York, Boston, Philadelphia and Baltimore are pretty sure to suffer on account of much of the products that should appropriately pass through them, seeking a cheaper outlet to market not only by way of the Mississippi River, but also by way of the Lakes, the Welland Canal and the St. Lawrence.

DUTY OF INCREASING OUR FOREIGN MARKETS.

"The capacity of this nation of ours for production is unlimited, but the market for these productions is limited," said Secretary Windom last Tuesday night at a banquet given here on the 113th anniversary of the foundation of the Chamber of Commerce, and he insisted that it is the duty of the Government to aid in enlarging our present foreign markets and in opening new ones. In this opinion we heartily coincide. It is by such policy, vigorously and often unscrupulously carried out, that Great Britain has become the foremost commercial nation in the world. Not only have her agents been constantly and laboriously eager to extend the sales of her wares in all civilized lands, but the bayonets of her armies have often opened the road to markets for them in savage and semi-civilized countries. It is by such energetic and far-sighted policy that to-day she rules the markets of the West Indies, Mexico, South America, China and Japan, whose needs ought, geographically, to be supplied from this country. What has the Legislative or Executive Department of our Government done to secure to our agricultural and manufacturing industries their fair share in the trade of these and other lands?

In this connection not only has the Government left undone many of those things it ought to have done, but it has done at least one of those things it ought not to have done, and on one point, at least, helped to curtail instead of to enlarge the foreign markets for our products. One of the most effective means adopted by Great Britain and most of the other prominent European powers for the increase of their export trade has been the encouragement given to the growth of their mercantile marine; whereas since early during our civil troubles the policy of this Government has tended directly to lessen the number of American vessels afloat on the ocean. Before the late war our mercantile navy was second only to that of Great Britain; to-day, so far as the ocean carrying trade is concerned, we have none—worth mentioning. This is well illustrated by the fact that during the first four months of the present year not a single American vessel was loaded with grain at New York for any foreign port. During January there were shipped from here 3,371,744 bushels, in 106 vessels; during February, 4,213,863 bushels, in 125 vessels; during March, 6,645,712 bushels, in 173 vessels; and in April, 6,752,680 bushels, in 171 vessels; or a total of 20,983,999 bushels, in 575 vessels, not one of which bore the Stars and Stripes!

Not only are our citizens not allowed to buy ships where they are cheapest, on the plea that home ship-building must be "protected;" but American ships have been subjected to taxes from which competing foreign vessels have been exempt. For eighteen years a mere semblance of life has been kept in the ocean ship-building industry of the country at the cost of the extinction of life in its ocean ship-owning interests—isn't it about time to put vigorous life into the latter even at the risk of endangering the moribund existence of the former? Already the prophets of evil are foretelling another era of national adversity; but when this comes it will be when we fail to find a market for what we have to sell. Then there will be a glut at home, prices will go down, and the sun of our prosperity will be overcast. The best way to defer that evil day is to enlarge our foreign markets, and one of the most effective means towards this end is to increase the number of American ocean-going vessels. Away, then, with all legislative obstructions on the road to this object!

BREVITIES.

We are sorry to say that of our Black-caps, the Gregg—the best of all—is the one most harmed by the past Winter.

Of all our wheats Shumaker at this time (May 12) looks the best. That is, it is the tallest, thickest, and bears the broadest leaf.

We have received from Dr. M'Aboy of the Thermal Belt, N. C., a sprig of the peach six inches long and bearing 13 peaches the size of peas. This does not look as if the peach crop had been seriously harmed in that genial region.

Our very much esteemed contemporary, the American Dairyman, objects to our equanimity under what it considers the great misfortune of the projected World's Fair *fiasco*. It does not see where the fun to the farmer comes in, nor can we see where the sorrow to the farmer comes in. What profit did the farmer derive from the Philadelphia Show? What glory did the dairyman reap there? Still, in view of the possibilities of benefit to the farmer therefrom, we did our share towards helping the project along, but we believe it better to laugh than to cry over "spilt milk."

Sealed milk-cans or jars, wherever they have been introduced, have inspired city people with a good deal of confidence in the purity of their contents, but of late this confidence is being rudely shaken by the bluish tinge the milk often presents at breakfast, and its streaky, queer appearance when it has rested some time. Water is more plentiful and therefore cheaper than milk on some farms, and on a few of them it is to be feared more of it gets into the milk-can than ever passed through the cow. Moreover, a good deal of the milk sold in these receptacles is put into them at the various milk depots, and the folks there know the right proportions of milk, water, chalk and flour to make a salable article. It is a misfortune to farmers as well as to all other classes that the dishonesty of a few among them is likely to bring blame and loss on many of the best of them.

The shipments of flour from New York during last March exceeded those during March, 1880, by 1 500 000 barrels, and there are strong indications that, ere long, exports of flour will supersede those of wheat to Europe, South America and especially to China. It is estimated that by sending flour instead of wheat from the West across the Atlantic about 30 per cent of the weight and consequently of the freight charges are saved. If, therefore, the freight of wheat to Liverpool, Glasgow, or Bremen be reckoned at 50c. per bushel, the saving would render the wheat worth about 16 cents more where it is produced. This calculation may be a trifle high, but we may safely consider the increase in its worth at 10 to 12 cts. a bushel—an important margin to the farmers of the country and one which would give us a strong hold on our foreign markets. So great is the increase that is being made in our milling capacity that by next harvest there will be facilities for grinding a large proportion of the wheat crop.

The wretchedness of our mercantile navy saves us from some disgraceful losses incurred by over-covetous or dishonest British ship-owners. Lately four English grain-laden vessels were sent to the bottom by their excessive loads. Last April the Belize, with a registered tonnage of 1,768 tons, put to sea from Halifax with a cargo of 2,330 tons, and foundered, as might have been expected at that stormy equinoctial season. The steamer Marlborough, again, left this port with a load of 3 370 tons, though her registered tonnage was only 2 308, and went to the bottom during the first gale. Across the Atlantic, the steamer Constance put out from Cardiff with a load nearly double her registered tonnage and foundered and the Kensington with a registered tonnage of 1,401 and a load of 2,033 tons shared the same fate. The greed for high freight returns or for insurance money must have been the cause of over-loading these vessels and there is evidently need of more stringent legislation to prevent not only the inevitable loss of property, but also the probable loss of life consequent upon such reckless greed.

Pellagra is a disease which of late has become unusually prevalent in some parts of Italy, especially in the provinces of Brescia, Padua, Piacenza and Ferrara, the ratio of those afflicted in Brescia being about eight per cent. of the population. Sardinia and Sicily are exempt from it, and it seems to have been unknown before the middle of last century. Even now its ravages are confined to those of the rural laboring population who are ill-fed and over-tasked—people morally reduced to the level of brutes and physically ruined by the inhuman severity of their labor, the infamous quality of their food and the utter wretchedness of their lodgings. The earliest symptoms of the disease are an itching and redness of the hands and feet, and a scaliness of the skin. The body gradually wastes away and dries up until the patient becomes a mere listless, insentient mummy. Great efforts have been made to discover the cause of the evil, which has been assigned mainly to poor food. Its unusual ravages of late having aroused the attention of the government and of the municipal authorities of some of the chief cities, further investigations as to its origin have been made, which have resulted in what is considered a solution of the mystery. Indian corn meal, or maize flour, is the staple food of the smitten peasants who rarely use it in a wholesome state, but when more or less fermented make it into bread which even the pigs refuse. This is washed down with unwholesome water and is now considered the main cause of pellagra.

Telegrams from Omaha dated the 11th and from Chicago dated the 12th, announce that Eastern Nebraska and Western Iowa are suffering great losses by a disease which veterinary surgeons pronounce to be malignant anthrax, a highly contagious malady known also as carbuncular erysipelas, charbon, bloody murrain, black-quarter, black-leg, black-tongue and by several other names according to the particular form in which it becomes manifest. The chief causes are: pasturing on swampy lands in Spring or Summer, drinking stagnant water, change from scanty, dry feed to abundant, succulent pasture. Young cattle are especially liable to it and those in prime condition. The attack is frequently so speedily fatal that the dead bodies of the animals seen in the pasture in the morning often give to the owner the first intimation of the existence of the disease among his herd. On the first discovery of this malady in a herd the sound animals should be at once removed to fresh pastures where there is pure water and where the usual remedies should be promptly used. It should be borne in mind that the poison of malignant anthrax can be carried to healthy animals in any part of an affected one, even in the excrement, or by flies, etc. It is also communicable to man either by eating the diseased flesh or by the blood or saliva of an infected beast coming in contact with a sore, no matter how small. Should this occur the sore should be at once cauterized with lunar caustic. The carcasses of infected beasts should be buried so that pigs and dogs cannot get to them to spread the malady. Owing to the late severe floods on the bottom lands throughout the West, this disease is likely to be very prevalent there this season among herds feeding on the swampy pastures dotted with stagnant pools—hence this early note of warning to our readers.

Miscellaneous.

RURAL BRIEFLETS.

KEROSENE the nests and roosts of the poultry houses. Whitewash everything in them—ceilings, roosts, nests and all. Sprinkle a little flour of sulphur in the nests. First, however, change the hay or straw. If confined in runs, give them daily a quantity of grass and clover. Provide lime. A little bone flour mixed with their food is excellent, and helps provide material for shell-making. Keep the houses clean.

.....

WE are well satisfied from experiment that rolling (should the weather be dry) after planting corn is advantageous in securing the germination of the seed. The best stand of corn we have ever raised was sown not until June 10, and the land was rolled with a heavy iron roller after planting. The earth is thus brought in close contact with the kernel and the radicle (rootlet) finds support as soon as it emerges from the seed.....

NOT less than 50 of our readers have written us to say that the potatoes received were *not* White Elephants, but Early Rose, Beauty of Hebron, or other old varieties. Not so, good friends. They are—every one—White Elephants, as those who plant them will ascertain.....

A FARMER and subscriber called at the office a few days ago to make inquiries as to certain kinds of corn. In the conversation which followed we had occasion to allude to our crops. "Then," said he, "you really *have* an Experiment Farm, without any humbug?"

We are not surprised that people are incredulous as to much that they read in newspapers. But it had never before occurred to us that any reader of this journal could have doubted that the Rural Experiment Grounds were an actual existence.....

HERE is the first report from the White Elephant Potato. It comes from Richard Lee, of Florida:—"Dug White Elephant to-day (April 26th). Ten pieces were planted, of which six bloomed. The frost had no effect upon the plants. The yield was 72 tubers—38 of large size; 30 average; nine smaller, and five small.

.....

DUCHESS STRAWBERRY is, as usual, the first to bloom at the Rural Grounds. At this time (May 3) Iowa Prolific, Franklin, Emma's Favorite, Memphis Late are looking rather more vigorous than other kinds—though all look well, and an immense crop is promised.....

NITRATE OF SODA, superphosphate (burnt bone treated to sulphuric acid), muriate of potash, the three most important sources of plant food, are now furnished in small quantities by dealers, for the purpose of enabling farmers to determine what their soils most need, at a low cost. Thus, if phosphoric acid alone produces as good results as nitrogen, potash and phosphoric acid combined, it would be a sad waste to apply all three. And so of the others. Full and very plain instructions accompany each bag of these trial sets, which may be purchased for five dollars the set. We are assured by our leading fertilizer firms that this price barely covers the cost of preparing the sets, the object being to familiarize farmers with their economic use....

WE are now preparing to plant the following kinds of sweet corn, viz., Minnesota, Egyptian or Washington Market, Evergreen, Black Sugar, Mammoth, Asylum, Tuscarora, Triumph, Hickox, Concord and Narragansett. All that bloom at the same time will mix, of course. Our object, however, is to note the time of ripening, the yield of each, the hight, the quantity of leaves, as well as the quality of the corn, and all this may be ascertained as well if they do mix somewhat as if they do not.....

IT has been ascertained that in many cases the silk of a given ear must depend upon the pollen from other plants for pollenation—in other words, the embryo kernels (ovules) must depend upon other pollen than that which matures upon the tassel of their own stalk, for fertilization. Three years ago we planted in about one acre not less than 60 varieties of field corn. The ears showed about 25 per cent. of intermixture. An unusual percentage of a failure of the kernels to form, that is, missing rows on the cob, was also apparent. That, however, but 25 per cent. of the grains showed intermixture is no proof that a much larger percentage was not mixed. Many times, without doubt, a kernel may have every appearance of the other kernels upon the same cob, but when planted, *its* progeny may show a decided intermixture. In our attempts to produce a rose-colored sweet corn from a cross between the Black Mexican and Stowell's Evergreen, a considerable percentage still comes black, though *only* rose kernels are planted.....

ONE of the most remarkable results of the experiment above alluded to (60 varieties), was that though no black seed was planted, an occasional black kernel appeared in the product.....

IT would appear by the experiments of the farm superintendent of the Ohio State University, Mr. C. E. Thorne, that the value of the seeds of the Early Amber Cane is only less than that of Indian Corn. He says an acre should yield over 20 bushels of seed. There are other varieties of sorghum, however, that, though their sugar qualities have not been ascertained, would give twice that amount of seed per acre. . . . . Mr. Thorne gives no encouragement to the ordinary, average farmer that he can ever hope to make sugar economically by the appliances within his reach. The required machinery is too expensive, and it requires a special knowledge that he does not possess.....

THE Prairie Farmer concedes that Gen. Le Duc "is an earnest and not entirely impractical man."....

"IT is possible," Mr. Meehan says, "that Bermuda Grass will not (in the South) stand the close clipping of a lawn mower—Has any one tried it?" We would reply that Mr. P. J. Berckmans, of Augusta, Ga., has tried it and finds that it *will* stand the lawn mower.....

THE best material for plant labels is a perennial, evergreen subject of talk. We have shown that common lead-pencil marks upon zinc will endure for years—will, indeed, grow more distinct with age. Such marks become, also, indelible after a few months. May we not accept the lead-pencil and zinc label and call the controversy closed?.....

WE take the risk of displeasing Mr. Woodward by publishing the following business letter:

"Inclosed I send you draft for $66.10. You will observe this is $10 above the amount of bill; but our trustees, appreciating what the RURAL had so generously done for the "Niagara," unanimously voted to add the above amount over. I guess everybody takes and reads the RURAL, for the answers to our advertisements still come pouring in. We have had abundant success with our plan of placing "Niagara." All our vines are placed and we are compelled to refuse dozens of applicants who insist on being supplied, and some even insist on now making contracts for 1882 planting. The vines have come out of the Winter in fine order, although many other kinds were injured."....

ONE of the foremost aims of the RURAL NEW-YORKER is to have a hand in introducing new plants of value. We do not know of any other way in which we can better aid the people for whom we write. The trouble is to escape undue praise in speaking of new plants; for where one is offered that is really an improvement over old kinds, hundreds are announced that prove inferior. It is next to a certainty that our praise of the Niagara is well deserved and we are glad of the above frank recognition that the RURAL has so aided in its distribution.....

WE are continuing the present season to test all the new agricultural plants that we can get a hold of, and, as heretofore, we shall report upon them according to their *merits* without the slightest regard to the introducers' interests. We hope to control the RURAL NEW-YORKER long enough to prove to certain liberal-minded advertising patrons that there are other considerations which we prize far more highly than even their gracious patronage.....

A RESPECTED friend and one who is doing a noble work for American agriculture, though his name is rarely permitted to appear in print, writes us as follows:

"I just happened to fall into conversation to-day with a practical farmer who was once a mechanic. He was speaking of the farmer's life and occupation as so much more an art, so to speak, than those of the average carpenter, surveyor, engineer, and a multitude more in the same class. I was so deeply impressed with the truth of this observation, that I was prompted to write and suggest to you whether it is not one of the mistakes commonly made, that people think farming a low and inferior occupation. Now, it seems that I could more readily turn out a hundred mechanics of any ten trades you can mention, than one good, well-trained farmer that could be ranked first-class. It occurred to me that if you could present this thought and view to your readers you would be doing an essential service to the interest of good farming, and help to honor and dignify the cause. If this suggestion can be of any service to you, I shall be glad."

A "SURE" SAFEGUARD AGAINST MOSQUITOES has just been sent us by a friend in Charleston S. C. and in view of the speedy appearance in this latitude of musical Mrs. Mosquito (the females alone annoy us) with her odious little "bill," we hasten to present it to our readers. The use of it may not be considered "nice" or practicable by all of them, but those of them who are in the open air at night would often doubtless be thankful for its protection. Macerate one part of Pyrethrum roseum in four parts of dilute alcohol; dilute the mixture with ten times its bulk of water, and apply it to any exposed parts of the body, and "it gives perfect security against all vermin."

Literary Miscellany.

LARRIE O'DEE.

Now the widow McGee
And Larrie O'Dee
Had two little cottages out on the green,
With just enough room for two pig-pens between.
The widow was young and the widow was fair,
With brightest of eyes and the brownest of hair,
And it frequently chanced, when she came in the morn
With the swill for the pig, Larrie came with the corn,
And some of the ears that he tossed from his hand
In the pen of the widow were certain to land.

One morning said he:
"Och? Misthress McGee,
It's washte of good lumber, this runnin' two rigs.
Wid a fancy partition between our two pigs!"
"Indeed, sure it is!" answered widow McGee,
With the sweetest of smiles upon Larrie O'Dee.
"And thin it looks kind o' hard-hearted and mane,
Kapin' two friendly pigs so exsadingly near
That whenever one grunts thin the other can hear,
And yit kape a cruel partition betwane?"

"Shwate Widow McGee,"
Answered Larrie O'Dee,
"If ye fale in yer heart we are mane to the pigs,
Ain't we mane to oursilves to be runnin' two rigs?
Och! it made me heart ache whin I paped through the cracks
Of me shanty, lasht March, at yez shwingin' yer ax,
An' a-bobbin' yer head, and sthompin' yer fate,
Wid yer purty white hands jisht as red as a bate,
A-shplittin' yer kindlin'-wood out in the sthorm
Whin one little sthove would cape us both warm!"

"Now, piggie," said she,
"Larrie's courtin' o' me,
Wid his delicate, tinder allusions to you;
So now yez musht tell me jusht what I musht do.
For, if I'm to say *yes*, sthir the shwill wid yer shnout;
But if I'm to say *no*, yez musht kape yer nose out.
Now, Larrie, for shame! to be bribin' a pig
By tossin' a handful of corn in its shwig!"
"Me darlint, the piggie says *yes!*" answered he,
And this was the courtship of Larrie O'Dee.

—Independent.

ADVENTURES OF AN ANTEDILUVIAN

In The Land of Promise.

BY JAMES M'NEILL.

CHAPTER XVIII.

TELERAMIC VIEWS FROM MOUNT KOPIAH.

We were now nearing our destination. We could discern Mount Kopiah, like some tall monument, towering far above the lesser peaks of the mountain range, and, by the aid of our glasses, the substantial building which crowned its summit was distinctly brought into view. It was massive in its architecture, and looked not unlike some ancient castle. And though in its construction the idea of resistance to the high winds of its altitude was ever kept in view, it was not wanting in architectural beauty. The fact that it had the appearance of being chiseled out of the crown of the peak, and that the peak itself was of the purest white marble, would have invested it with an interest and beauty in my eyes, independent of any architectural taste displayed in its construction.

It was circular in form, its walls being relieved by eight low and very substantial round towers. Its roof was a dome, from the center of which another tower rose to the hight, perhaps, of twenty feet above it. It was in this tower that the instrument was placed which made Mount Kopiah famous. It could be seen by us in the open space of about ten feet below the roof, which was a dome in form, and was supported by six iron pillars, which at the same time served the purpose of bolts to hold the roof against the power of the hurricanes.

Our captain now began to increase his altitude so as to strike the level of his landing-place. This was a wide terrace some ways down the sides of the peak, which extended completely around it; so that from whatever quarter the wind might blow, a landing could be effected on the opposite side of the peak without difficulty.

As we approached nearer we could see several air-ships laid up on this terrace, their balloons being emptied and folded by the side of the cars. One was hovering above the terrace like a bird preparing to light, while we could count twelve others approaching from different quarters.

When we came within about a third of a mile from our landing the captain began to reduce his speed, and so skillfully did he gauge the distance that our ship came to a full stop just above the terrace, and, without a moment's delay, down it went to terra-firma, with not a jolt or a jar more than would be experienced on the elevator of some great hotel.

The phillego was almost instantaneously resolved, and the balloon lay a placid heap of cordage and plymer upon the ground. Attendants were at hand who quickly disposed of our ship where it would not interfere with the landing of others, while we passed on to the inclined railway, by which we were to be borne up to the summit. Here again the all-potent phillego was brought into requisition. By its lifting power, the car, which had a seating capacity of twenty passengers, was borne rapidly up an incline of only about twelve degrees from the perpendicular. There were grooves in the rails, as on the elevated railways, which kept the car from leaving the track if a gust of wind should suddenly strike the balloon. I was told that there were eight of these inclined roads at regular intervals around the terrace, and that in pleasant weather they were kept constantly busy carrying passengers up and down.

There was a party of ten seating themselves in the car by which we were to ascend, so that our party just filled its complement of passengers. Scarcely were we well seated when the manager shouted "all ready," and we shot up the incline of over two thousand feet with a terrible whir which makes me shudder even to this day, when I think of it.

Having reached the summit, we stepped out on a marbleized terrace which completely surrounded the building to a width of twenty-five feet, being guarded at its outer edge by a stout iron railing.

It was now eight o'clock, A. M., and, as we had left home shortly after three, we had made the distance of five hundred miles in less than five hours. Yet we had only drifted leisurely along with a favorable current, without any attempt at speed.

I was greatly surprised at the number of people who were constantly appearing on the terrace from the inclined roads. I was told that the building had a seating capacity of 10,000, but I began to think it prudent to secure a seat, especially as the air was thickening with ships approaching from every quarter like bees flying home to their hive.

As I entered the door of this immense building, I stood for a minute lost in wonder at the magnitude of its interior. The wall upon my right was a plain surface, perhaps four hundred feet long by forty high. From each end of this, the rest of the wall extended in the form of an elongated semi-circle. The seats were arranged in rows which followed the curve of the wall, and which rose with a gradual ascent from front to rear. They were not hard and uncomfortable benches or settees, as one might expect to find in a place of such magnitude, and which was frequented only during a portion of the year, but luxuriant chairs, in which one could sit for hours without weariness.

There were nearly a thousand persons already present, and others were crowding in so rapidly at every entrance that we thought it advisable to secure our seats.

The entertainment began about half an hour after we were seated. The room was suddenly darkened, and the next instant a great white object appeared on the plain surface of the opposite wall, which the manager informed us was a snow-capped mountain peak some four hundred miles away. Gradually it moved over the surface of the wall, and lesser peaks and gorges filled with snow and ice were brought into view. Down the side of the mountain we seemed to travel. Now a peak still snow capped crossed the field of our view, around the side of which we continued our descent. Little rivulets were forming from the melting snow, and suddenly a mountain torrent, foaming along between its rocky barriers, burst upon our view.

An exclamation of delight arose from the audience as this swift stream crossed the field. It appeared so near us, and looked so real that it seemed as if we ought to hear the splash of its waters as it dashed down over its rocky bed.

The snow was now left behind us, and we emerged upon green hillocks and grassy slopes whose flower be-spangled freshness was indicative of the Springtime. The trees were putting on their Summer foliage. Birds were flitting about among their branches, building their nests, and making their Springtime loves. While now, and then a fine gray squirrel would scurry across our field of view as though it felt the magnetic influence of five thousand pairs of eyes upon it, and was disposed to hurry out of sight. Next appeared a man sitting on a ledge of rock with a long staff beside him. "Ah!" said the manager, "here is a shepherd. Let us look for his sheep, for they are doubtless near." Then we seemed to travel off to the right again, then up a little, when suddenly the exclamation burst from the audience "There they are!" and sure enough, in a little grassy valley, many of them quite concealed from view, a flock of noble looking sheep appeared, quietly grazing.

Halting awhile to allow us to fully take in this scene, the panoramic views again passed on. The next object of interest which came within the field of the instrument was a herdsman's village. Situated in a delightful valley, which was guarded on either side by a mountain spur, and which seemed to form a passage-way from the plain into the heart of the mountain range, it presented a most picturesque appearance. Great was my surprise to find that in every detail of construction and arrangement its houses were as tasteful and complete as those in any village of the plain. It was not more than half the size of these, but it had its church, its school-house, its gymnasium, and its pavilion. While a dam thrown across a mountain stream farther up the valley caused fountains to play all along the well paved street, and brought an abundance of water into every house.

The men and women were out in the fields, which extended all about the village, harvesting their crops. There was nothing in this part of the scene which was new to me. The implements which they used were the same as those which I had seen. The barns were as commodious and well arranged. The manner of harvesting the crop was the same, and the crop itself was as abundant as any which were raised on the plain. There was not, of course, the same variety to the productions of this mountain village; for by their location they were shut up to a single branch of husbandry. And except the few products of the soil which the people of the village themselves required, their agricultural labors were directed to the maintenance of their flocks.

This picture was the most pleasing which was presented to our view. There was something so cosy in its aspect, and such an air of peaceful contentment and isolated enjoyment about its every feature that I felt as if I should like to fly away to it and dwell for the rest of my life within its happy precincts.

From this mountain village we traveled down into the plain and across a great expanse of country which presented many interesting objects to our view. But upon these I will not dwell, as most of them were similar to the scenes which we had seen in our aerial voyage, though much more distinct and complete.

The range of mountains in which Mount Kopiah was situated now crossed the field, but such was

tho wonderful power of the instrument that the objects which were now thrown upon the wall, though only a few miles distant, were no larger nor more distinct to our view than those four hundred miles away. As the views had been approaching us on our right, having crossed our position, they now began to recede upon our left. The manager now gave us a great variety of pleasing scenes. Long practice with the instrument had enabled him to find readily every important scene in this very interesting section of country within a radius of over four hundred miles, so that, sitting in our easy chairs, we were in effect traveling rapidly from one interesting point to another over the country and feasting our eyes upon every variety of scenery. Cataracts, lakes, rivers, wild mountain views, peaceful rural scenes, and the busy scenes of the cities were thus in succession brought before us, till we had traveled over the country on our left a distance of nearly three hundred miles from Mount Kopiah.

Here a most interesting scene was reserved for us. Old ocean, with its swelling waves beating against a rock-bound coast, now crossed the field of our view.

We wandered along the shore, feasting our eyes upon a great variety of coast scenery, till we came to a great maratime city. Here we stopped awhile to view the shipping in the magnificent harbor. By the wonderful power of the instrument the whole bay could be thrown on the wall at once, or a ship enlarged so as to cover half its surface.

These ships were queer looking things, without masts, or sails, or smoke stacks. They were constructed of wood which was covered with a preparation of blisten, which made its surface, at least on the bottom and sides of the vessel, as hard and smooth as glass. They were all propellors, having philiego as their motive power. They also had philiego sails, to be used on the ocean, which, being self-sustaining and controlled by suitable tackling, entirely did away with masts and spars. In unfavorable weather these could be folded away and the ship managed by her propeller.

After lingering awhile in the harbor and along the wharves of this city, we passed out to sea that we might gain a view of a ship under sail. Diminishing the magnifying power of the instrument so as to take in a larger surface, the manager scoured the sea for some time before the desired object was discovered.

Appearing first a mere blurred spot on the surface of the water, the ship gradually grew in size and distinctness till it occupied in length about thirty feet of the wall. With all sails spread it seemed to be cutting its way rapidly through the gently swelling waves. We could see the spray dashing back from its prow, and the long line of agitated water which it left behind it. The sailors also could be seen moving about at their various duties. We saw them so distinctly that we almost wondered why they were so indifferent to our presence. They looked to us as they would from a cliff but a few hundred yards from them, though they were in reality nearly four hundred miles away.

While we gazed upon this pleasing spectacle, a man whom we took for the captain came forward to the prow with a spy-glass in his hand, and stepping to the gunwale, earnestly scanned the horison. He called two others to his side, and they in turn looked through the glass. They seemed to confer with one another, and then the first looked again. After which he folded the glass abruptly and appeared to be giving orders to his crew.

"A storm is coming," said the manager.

Scarcely had he uttered these words when the sails fell to the deck and an animated scene was presented to our view as the sailors flew about to get the ship in order for the approaching gale. The deck was soon cleared of tackling, everything was made secure and the sailors stood round upon the deck, earnestly scanning the horizon, and apparently waiting for the storm. Soon the waves began to swell and the ship rose higher and sank lower at every undulation. Then the gale seemed to burst upon it in all its fury. The sailors disappeared from the deck, the hatches were closed and the ship like a dismantled and deserted hulk scudded before the breeze, while the foam-crested waves broke over her deck and sometimes nearly buried her from sight. Then a mist came over the scene, which deepened rapidly till it assumed the black appearance of a fierce thunder storm.

A sound as of rain pattering on the roof was now heard which soon became the roar of a deluge. In the midst of this a blinding flash of lightning illumined the scene, and a peal of thunder followed which fairly caused us to shake in our boots.

Never was there a more realistic scene. Indeed, diffidence alone prevented me from running to the door to see if a storm were not actually raging without, while the thought flashed across my mind: perhaps all these scenes which have been presented to us as actual existences are merely painted representations thrown upon the wall by an instrument of the magic-lantern order.

This thought did injustice to the entertainment. It was everything that it was represented to be and these accessories of rain, thunder and lightning were the results of mechanical appliances made use of to lighten the effect of the scene, when, as was often the case, a storm came within the scope of the instrument.

The roar of the down-pour was now subsiding, the flashes of lightning became less vivid, and the roll of the thunder seemed to be dying away in the distance. Soon the mist on the wall lightened, and dark clouds could be seen rolling away across its surface. Then, just as the roar of the storm had completely ceased, a gleam of sunlight was thrown upon the scene, and the next instant the bow of promise appeared in the clouds, spanning the whole length of the wall with its graceful arch. Never was anything more natural, more artistic, or more skillfully executed than this whole storm scene. Growing so naturally out of the grand ocean view, every step in the progress of the scene seemed to heighten its effect, till, when the violence of the storm had passed and the bow of promise appeared in the clouds, the enthusiasm of the audience could no longer be restrained, but found expression in a shout of delight.

This was a fitting conclusion to the entertainment. It had held our unwearied attention for three hours, and we were satisfied to leave, that the vividness of this last grand science might remain unmarred by anything which might follow.

A busy scene was now presented as the great audience of five thousand souls made preparations to depart. During the entertainment nearly all the ships had been elevated to the terrace immediately about the building, where they were ranged side by side with their prows turned outward, almost as thick as they could stand. To avoid collision each tenth one was filled first, and, as soon as it had taken the air, the one on its left was quickly prepared to follow. By this arrangement between thirty and forty rose safely in the air together, and in a little more than half an hour all had departed. The larger ships remained on the lower terrace, and to these their passengers descended by the inclined roads. It was really a hair lifting sight these great air ships, filled with human beings, shooting off into the air one after another from this dizzy hight with the same boldness and confidence that a flock of birds would take the air. But of course I was a stranger to such scenes. It was about twelve o'clock when our party got started on its homeward journey. We had to strike a higher attitude than that by which we came to find a favorable current, and then we made but half the speed of our outward trip, still we had all the afternoon for our journey, and we were willing to have it prolonged.

As soon as we were well settled on our course we turned our chairs inward and spread out our lunch. This was the last thing which I remember. A giddiness here came over me, and it seemed as if the captain had lost control of the ship, and it was whirling wildly through the air, and sinking rapidly toward the earth. This feeling lasted perhaps a minute. Then there came a crash, and I woke to consciousness.

I found myself seated in my easy chair, where I had thrown myself the previous night, the morning light was streaming in through the closed window blinds, and my friend, grown anxious because of my non-appearance at the breakfast room, was pounding on my door, and calling out excitedly to know what had happened to me.

I sprang up and opened the door, and with my finger on my lip enjoined silence. "Say not a word," said I "lest the spell be broken. But take your pen, and sit down quickly." Then throwing myself on the lounge, and covering my eyes from the light, I never got up till I had dictated to him my vision.

THE END.

For Women.

CONDUCTED BY MISS RAY CLARK.

HER SECRET POWER.

EDGERTON.

THERE lived a spinster maid, in days gone by,
Of age most doubtful and of habits sly,
(Exactly where she lived, is now forgot,
But this unto my story matters not,
My readers all, no doubt, can fix the place,
Since she is still well known this day of grace—)
Who had a secret power of finding out,
Whatever happened, and whate'er about;
A most mysterious power it sometimes seemed;
She'd tell you things of which you never dreamed
And oftentimes would cause you great surprise
By that which happened just before your eyes.
The sacred secrets of a neighbor's house—
As they supposed, kept stiller than a mouse—
Flowed just as glibly from her rattling tongue
As though in public they'd been preached or sung:
The little courtships of the girls and boys,
She played with, as do children with their toys—
This seemed, in fact, to be her favorite theme,
She loved so well to baffle, plot and scheme—
And many a young heart did she bring to grief,
By pilfering secrets like a common thief.

At last, her victims, who could bear no more,
Went to her with their wrongs, laid at her door
And asked of her, in mercy to refrain,
From idle tattling which might cause them pain;
And also sought of her to kindly tell,
How all their little secrets she found out so well?
And she their anger only more to chafe,
This explanation to them did vouchsafe—
"The secret of my power has ever been,
A blue-bird nestling under my warm chin!"

YOUR CHILDREN'S FRIENDS.

I KNOW that childrens' company is apt to make some trouble to a home-mother, but it is a kind of trouble that pays. It makes children so much happier to have their little friends made welcome, at their own home. It raises mother in their esteem to have other little folks think she is "nice." Children are sharp little critics; form their opinions, and speak of them to others, quite as decidedly as their elders do.

A little girl who had displeased her mother was "punished" by having her little playmate sent home with sharp and angry words, which were entirely unmerited. The heart of the little visitor was greatly shocked at the rude blow to her spirit and never, even to the grown up years, could look at that woman except with aversion. She was an excellent woman in the main, but she had her "cross spells," like some others we may know. Everybody appears at their worst when such spells are on.

It is an excellent thing to know with whom your children play, and how they deport themselves. If they are made welcome at your home, you have the very best opportunity of gaining this information. It need not be very irksome if you keep the number within bounds. In Summer our little visitors like to sit out with their playthings on the shady porches, or in the door-yard. In cold weather they can have the warm dining room. If disposed to run over the house, it is sufficient to say decidedly, "Don't run up stairs, please, just play in the dining room," and I have never known a child to disregard the request.

It is worth a great deal to make children happy. They remember little treats longer than we suppose. A lady once said that one of the pleasantest recollections of her childhood was of sitting on a grassy bank, and of a fair hand reaching from a window and placing a handful of large, delicious strawberries in her lap.

I often set out a plate of sandwiches, cookies, apples, or whatever is handiest in the pantry and then let the little girls arrange them to suit themselves on this little sprigged tea-set. A little coffee and sugar and milk in their small dishes makes their happiness complete.

Be a lady to your boys' friends and leave a good impression upon them, if you wish to retain the respect of your own dear boy. It hurts boy's feelings, and mortifies them intensely to have mother speak snappishly to them before companions, making them feel that they are not wanted. Such boys are apt to wander away, with most resentful feelings, to seek such company as the mother would dread to have for their associates. But whom should she blame the most? OLIVE.

HINTS.

HOW TO WASH THE FACE.—Many people object to use of soap, disliking the shiny, polished appearance it gives, but any who use Dr. Wilson's directions will find that objection removed. They are as follows: "Fill your basin about two-thirds full with fresh water; dip your face in the water and then your hands. Soap the hands well and pass the soaped hands with gentle friction over the whole face. Having performed this part of the operation thoroughly, dip the face in the water a second time and rinse it completely. You may add very much to the luxury of the latter part of the operation by having a second basin ready with fresh water to perform a final rinse."

RENOVATING OIL CLOTH.—Oil cloth washed in hot water or in soapsuds, or with a brush, will look dingy when dry, and soon crack and peel off; but when always washed in luke-warm water with a piece of soft old flannel, and wiped perfectly dry each time, will last longer and retain its young looks down to old age; it greatly improves its appearance to use half milk and half water. Skim milk, if not sour, is just as good as new milk. This makes oil cloth look as if varnished. Neither soap, hot water or brush should ever be used on it.

TO CLEAN MATTING.—In cleaning matting wash twice during the Summer with salt and water—a pint of salt to half a pailful of warm, soft water; dry quickly with a clean soft cloth. Treated in this way the matting will not grow yellow. Or, if preferred, apply a thin coat of varnish to the matting. That will make it more durable and greatly improve its appearance. If varnished, it will not need washing. Now and then wipe with a wet cloth and dry quickly. Use white varnish on white matting. Be sure and have the varnish thin or the matting will crack.

FASHIONS.

STRAW-COLORED net is used to line the Tuscan lace bonnets.

Folded stocks of illusion are worn with high-necked white gowns.

Jet bands are worked on the wrists of black gloves to simulate bracelets.

Collars of white linen embroidered with small dots to match the color in the dress are to be worn with gingham suits.

Old Pekin striped basques are brought out, furnished up, and worn as new striped garments, superseding the old brocade.

Rough-and-ready straw sailor hats are worn by young girls.

Black is the favorite color this spring, for handsome toilets.

Sashes will be much worn.

Argent is the new name for silver grey.

Striped fabrics are very fashionable.

Open yellow straw, figures largely in Spring importations.

Silk bonnets are in high favor and are made to match the toilet.

Cheese cloth comes in a much improved form for Summer suits.

Large white collars of linen batiste will be much worn this Summer.

Uncut velvet in changeable colors will be used this season as a dress trimming.

Gloves to be fashionable must be loose in the hands and fingers, but actually wrinkled around the wrist.

Shaded or ombre effects are a decided feature in Spring fashions. Shaded feathers, shaded flowers and shaded ribbons are already plentiful.

English and French women are adopting the American fashion of tying a length of gauze veiling over the hat and around the neck. By and by they will send it back to us.

Dressy aprons of tinted mull or of silk in delicate colors are hand-painted in clusters of blush roses, dandelions, forget-me-nots and sprays of holly berries and leaves, and edged with slightly gathered frills of Newport point lace.

ABOUT WOMEN.

MRS. LOUISA G. ALLAN, the wife of the Allan who adopted Edgar Allan Poe, recently died at Richmond in her 83rd year.

MAGGIE MITCHELL'S season, the largest she has ever played, will close in May.

MARIE ROZE made her last American appearance at the Smalfield concert in New York and delighted a large audience with a series of English ballads.

MRS. FRANCES HODGSON BURNETT, at a recent meeting of the Washington Literary Society, read two short original poems.

MRS. GEAR, the wife of the Governor of Ohio, has, with the help of several ladies, been engaged in encasing the torn battle flags of the State in strong gauze, that they may be kept from harm and yet not concealed from sight.

A LONDON letter says: "It was rather romantic, the first meeting of the Baroness and young Bartlett. It seems he was a boy at Highgate School, and Lady Coutts chanced one day to be present at a school exhibition and heard him recite some poetry. She took a fancy to the boy there and then, 'tis said, and invited him, with one of his school-fellows, to visit her. He did so, and in the lulls between lollipops and jam tarts recited his poetry over again, to what effect on the heart and feelings of the old lady the culmination can testify."

MRS. BLAINE can keep a secret and ward off the inquisitive. One day, a short time ago, a fellow with a curious mind thought to ascertain from Mrs. Blaine whether the then Senator would become Prime Minister under Garfield. "I suppose you will be delighted when the Senator goes into the Cabinet?" said Curiosity. "Indeed," replied Mrs. Blaine in apparent astonishment, "I have noticed considerable comment in the newspapers on the subject. Pray, tell me what you know about it."

MRS. OLIVER Wendell Holmes, Jr., recently sold one of the beautiful pieces of embroidery which were at the Boston Art Museum for $500. It is a view of the Charles River wrought on dark-blue satin. Aside from the fact that it is always pleasant to see men or women use their talents, this will help some young women, who foolishly are unwilling to work for pay, to see that wealthy women are not above receiving remuneration for work done by them.

CORRESPONDENT'S CORNER.

I HAVE just read Mrs. Wager-Fisher's article on "Silk Culture in America," and wish the RURAL, as she suggested, would give its readers as much general and particular information on this subject as would be reasonable, or necessary to profitably carry on the business on a small scale. I, for one, would be very grateful, as I have been quite enthusiastic over silk culture ever since it has been started, but could get no *satisfactory* information concerning it. Please tell us where the cuttings and young trees can be obtained, as many of us, no doubt, must begin at the foundation.

Wishing much and long-continued prosperity, I am always the RURAL'S friend, EXPERIENCE.

IN a recent issue a request was made for information regarding graduating dresses—something inexpensive and such material as could be laundried. Also request for color, &c. of silk for dress for young lady.

We reply:—Get nun's veiling, which is very thin wool stuff, at an average cost of 50c. per yard—lower and higher rates according to quality. Make it with short or demi-train skirt with narrow plaiting at the foot.

Drapery in the shape of a pointed apron in front and two or three wide plaitings that cover the back from the left to the bottom of skirt.

For waist have a basque, square or pointed in the neck, and elbow sleeves.

Use the new d'Aurillac lace for trimming the entire or a part of the suit, as fancy requires.

This may be laundried, but with care can be worn a considerable length of time without the need of it. The lace may be bought for from 20 cents per yard upwards.

We think black silk would be the best selection in view of the requirements. Bottle green or navy blue would be a second choice.

Weakness and sickness changed to health and strength with Hop Bitters, always.—*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING SHOPPING.

MARY WAGER-FISHER.

To go to "town" to shop or "trade" is for many country women an event of real importance and often of very great fatigue, especially where the wants are many and there is only a little money to cover them. To be obliged to select and to decide upon fabrics or furniture within a given time is particularly wearisome to women who, as a class, are not trained to decide quickly in affairs of business.

In order to shop expeditiously, you should begin a week or two beforehand and make a list of everything you need to buy, or hope to be able to buy. After this list is complete, revise it by putting groceries in a column by themselves, and do the same with "notions," which include needles, pins, thread, buttons, trimmings etc., and classify fabrics in the same way. In making this revised list place at the top of the columns the most important articles—those that must be had at all events. Give yourself plenty of room, so that opposite each article you can note down the quantity required, with space also left for what you pay for it. With this prepared list in hand, you know very nearly what you want; nothing is forgotten and you are saved from confusion. In making your purchases first buy the material things, and then use the means left for those next in order.

I have shopped in many cities and villages, and with all my shopping I have found that I get the best satisfaction and the most for my money when I go to a first-class place where there is no deviation from a fixed price and where I have reason to believe that the shop or store is conducted in an honest way. I have never found it profitable to go from store to store hoping to find an article at a less price. A good article is never "cheap," and it is reasonable to suppose that a large dealer can

supply goods at a lower price than a small dealer can. But it is not wise to buy an article that does not suit you, and in order to be suited it is, of course, sometimes necessary to go from shop to shop. There is one sort of clerk by whom those who are not very strong-minded are in danger of being imposed upon—the clerk that tries to bully you into buying what you do not want. At the outset it is best to recognize the fact that the business of the clerk is to show you goods, but that you are by no means under obligations to buy. If you wish to look at goods with a view to future purchase, say so, and the clerk, if he is obliging, will show them to you cheerfully without urging you to buy at the time. No good woman will unnecessarily consume the time of clerks, as she values her own time too much to waste it.

In buying many articles, the buyer is no judge of their quality, and under such circumstances it is best to trust to the experience and honesty of the person of whom you buy. Especially is this true of silks and the finer class of fabrics. There is nothing gained, as a rule, in pretending to be wiser than you are, or assuming to yourself capabilities that you do not possess. In 99 cases out of 100 the average woman might as well buy black silk for her frock with her eyes shut and her hands tied as to look at it and finger it for half a day.

In buying ready-made clothing look well at the sewing. If there are ruffles, examine the hemming. If you are buying suits for children, ask for pieces of the same to patch elbows and knees. Before having the articles worn, see that the buttons are well sewed on, and fasten the ends of all seams so that there will be no ripping.

If you wish to have yourself and your children look the best possible, and close economy be at the same time desirable, you will avoid the purchase of light-colored fabrics in goods that cannot be washed. If you are over tall, or over stout, choose dark garments if you wish to diminish the appearance of your size. Do not buy light-colored mixed goods. Buy black or brown for yourself; navy-blue, bottle-green or dark maroon are all good colors for young girls. Whatever color is most becoming that adhere to, and don't change it for the sake of a "change," unless you have plenty of money, for a different colored frock necessitates a difference of hat, gloves, necktie and wrap, maybe. Moreover, it is pleasant and it gives one individuality to be associated with a certain kind of dress and a fixed way of arranging the hair.

For little girls or misses, a fine dark gingham is in better taste and better style for a frock than any light-colored fabrics that come under the head of "mixed Summer goods." For afternoon frocks for young or middle-aged women they are preferable to lawns or to linens, and if a modest pattern be chosen they will look well for several seasons.

In buying bonnets or hats never invest in a cheap *white* straw. Especially for children do not choose such, nor white straw trimmed with cheap light-colored stuff and flimsy artificial flowers. Select, instead, a stout brown or black straw of good quality and simply trimmed. Such a hat will look well until worn out, and not be spoiled by rain or damp weather. If one child outgrows it it will do for the next one. Train your children to prefer plain, substantial things to cheap and showy ones.

For boys from three and a half years of age upwards, it is fashionable as well as sensible to make their drawers of the same material as that used for their frocks. If ready made suits of cloth are bought you can find flannel of a similar color for the drawers.

Stockings are a very expensive item in a child's wardrobe, and any suggestion as to how the knees may be saved will, I am sure, be acceptable to mothers. "Creepers" are sold at the shops for this purpose, but they can be home made. To a square or oblong piece of thick cloth, large enough to cover the knee well, two elastics are attached at each end to the opposite corners of the cloth—the elastics passing around the under side of the leg, one above and the other below the knee, being of a length to hold the cloth firmly to the knee. Another method some mothers employ is to take a part of the leg of worn-out stockings and draw it over the knee of the youngster after his stockings are on. An old stocking is also the best material to use for lining the knees of stockings, because of its elasticity. It is an economy and a convenience to buy stockings of one color "year in and year out," as you then have to supply yarn of but one color for all the darning. "Odd" stockings can be paired and mended more easily and satisfactorily accomplished.

In brief, if you are obliged to be economical, confine your wardrobe and that of your children to one or two plain and modest colors, if you wish to be tastefully attired. Avoid "fancy" things and things "fanciful," as they prove in the end to be not only extravagant, but a snare and delusion to weary of, and then to be hung away to be food for moths until they become fashionable again, which they never do—quite.

ANOTHER WEEK FROM MRS. CLAY'S JOURNAL.

ANNIE L. JACK.

FRIDAY.—Sweeping up-stairs takes a part of the morning. Sometimes I wish our bed-rooms could be brighter and more cheerful, though there is no need to say that about Nora's for she has a woman's knack of making "things pleasant in one little place," like Mrs. Whitney's Barbara. But the rooms are small, the furniture old, and I should like to have them renovated according to my taste. But the children are satisfied: they are not yet tall enough to touch their heads against the top of the door, as one of my neighbor's sons can do. I often think one has the greatest pleasure while they are so content, before worldly ambition comes in and does away with their sweet trust and confidence. But I was talking of bedrooms. It seems better for me to hire a charwoman once a month and have the up-stairs put through a process of soap and water early in the morning. It seems to make everything fresh and clean; for carpets cannot cover everything, and I like best those rooms of our house where the floors are of hard wood, with rugs instead of carpets, which are so easily washed that the work is not considered a task by any of the family. And every year these floors improve in richness of coloring, needing only a yearly coat of boiled linseed oil. I rejoice in these pretty wooded floors and wish every woman who has to scrub or even use a painted floor could have them, also for bed-rooms and living-room especially. And as the "melancholy days" are robbed of their terrors where carpets are dispensed with, the sooner the day of hard-wooded, polished floors comes, the better for all.

I was told to-day that Lonsdale "said a bad word." Where do children pick up vulgar or profane expressions? I do not wonder in families where the parents are addicted to this distressing sin, but even where they are not, the young boys seem to learn these things better than their lessons. Perhaps they think it manly; if so, the sooner they are taught differently the happier will be the lot of those around them. I used to wash the children's mouths when they were little and threaten them with soap for the purpose, as a punishment for using rude and vulgar expressions. How hard it is in a family to watch all the sayings and doings of each member and administer the right treatment.

PASTRY.

CHIEF COOK.

SIFTED flour of the finest quality; butter washed the day before in cold water; a heavy, broad-bladed table-knife; a large wooden spoon; ice or ice-cold water and a marble slab to work on instead of a pie-board, are necessary to make such puff paste, as is seen at the best confectioners'. Take one pound of flour and one pound of butter. Cut the butter into four equal parts and then cut one quarter of the butter into thin, very thin, slices. Do not touch it with the hands, the object being to keep it as cool as possible. Then make a dough with the flour, butter and cold water, dredge the slab and roll the dough quite thin. Cut another quarter of the butter as before, lay the chips on the dough, fold it over after dredging with flour, roll thin, add another quarter of the butter, dredge and roll, and then add the last in the same manner, but this time leave it one-half to three-quarters of an inch thick. Cut the dough into as many pieces as is required for the number of pies, or tarts, and as nearly of a size as may be. Place on a plate upon ice till wanted, say for three or four hours. For making the crust for pies or tarts, use a small rolling-pin, only three inches long, by two inches thick, and with this roll the middle of the bottom crust quite thin, leaving the edges three times as thick. The top crust may be nearly as thin as the middle of the bottom one. Have the filling thoroughly cooked before it is put in the pie, and always bake in tin, and then let the oven be so hot that ten minutes time will bake it. For tarts or open top pies, bake the crusts, let them get cold, and put in the fruit just before serving. This makes the finest puff paste. Cheaper kinds are made by adding more and more flour to the pound of butter as above, and again by substituting half butter and half lard, or all lard for the original pound of butter.

THAT QUESTION.

"IT is hard learning old dogs new tricks."

The above ought to be an answer to M. W.-F. "Old-fashioned people" do not care to cut beans in halves and carry a half at a time to their mouths, as I knew a would-be lady to do. But when the lady of the house stepped out of the room she "shoveled them into her mouth as if that receptacle were a granary;" as a little four-year-old grandson said after the extra-nice lady had left, "Oh! grandmamma, I wish you could have seen Mrs. M—— shovel the beans into her mouth after you went out."

What were saucers made for? FARMER.

DOMESTIC RECIPES.

Indian Bread.

Four cups of corn-meal, two cups of graham (or white flour), two cups of sweet milk, two cups of sour milk, one or one-half cup of molasses, one teaspoonful of saleratus. Steam two hours and then bake slowly one hour. If made thinner, by leaving out part of the meal, and a pint of berries added (dried or canned ones will do), it makes a delicious plain pudding. Eat with cream and sugar.

Ginger Drops.

One cup of molasses, one cup of brown sugar, one cup of cold water, one-half cup of butter, one teaspoonful of saleratus, one teaspoonful of ginger (cinnamon is very nice in place of ginger). Stir rather hard and bake in a quick oven. Drop on buttered tins.

Ginger Cookies.

Two cups molasses, one cup butter or lard, one teaspoonful saleratus, one tablespoonful ginger, flour to knead. Roll and cut in squares with a knife.

Washington Cake.

One cup of sugar, one-half cup of butter, one-half cup of sour milk, two eggs, one-half teaspoonful of saleratus, one and one-half cup of flour, lemon to taste.

If you wish cream cake, make two loaves, split open twice, and spread between the layers the following cream: One-half pint of milk, one-fourth cup of sugar, one egg, one-half cup of flour; boil the milk, beat together egg, sugar and flour, and add enough cold milk to stir; stir the mixture into the milk and let it boil till done; then add one-half tablespoonful of extract of lemon; spread when cold EXPERIENCE.

Hop Bitters strengthens, builds up and cures continually, from the first dose.—*Adv.*

Trees, Seeds, Plants, &c.

HALF A MILLION
SWEET POTATO PLANTS
Also Cabbage and Celery Plants in large supply.
All Plants packed with extreme care.
Circular, with prices, free.
J. T. LOVETT, Little Silver, N. J

THE DINGEE & CONARD CO'S
BEAUTIFUL EVER BLOOMING
ROSES
The only establishment making a SPECIAL BUSINESS OF ROSES, 50 LARGE HOUSES for ROSES alone. We deliver Strong Pot Plants, suitable for immediate bloom, safely by mail, postpaid, at all post-offices. 5 splendid varieties, your choice, all labeled, for $1; 12 for $2; 19 for $3; 26 for $4; 35 for $5; 75 for $10; 100 for $13. We GIVE AWAY, in Premiums and Extras, more ROSES than most establishments grow. Our NEW GUIDE, a complete Treatise on the Rose, 70 pp. elegantly illustrated, describes 500 newest and choicest varieties—*free to all.*
THE DINGEE & CONARD CO.
Rose Growers, West Grove, Chester Co., Pa.

Headquarters of
Strawberry, BIDWELL.
The Finest New Strawberry before the Public.
Having secured a larger stock than I expected, I am able to offer this superb novelty at $1.00 per dozen; $4.00 per 100. I can sell steadily through May. Potted plants ready by June 1st. I invite correspondence from those wishing to buy large quantities. The attention which I have called to the Bidwell has brought into market much doubtful stock. I can warrant mine as genuine. Catalogues free.
Address
Cornwall-on-Hudson, N. Y. E. P. ROE

Miscellaneous.

The Literary
Revolution.
To keep in good humor the good people who delight in good books; to wake up the slow booksellers who are inclined to go to sleep in the summer, instead of, like a 'possum, in the winter; and to prevent our friends, the Cheap Books. book publishers, from forgetting us, we have concluded to publish a few more cheap books. If we are to name him at all, we must, of course, head Shakespeare the list with the immortal Shakespeare, and will give you either his "Merchant of Venice" or "Hamlet," or any one of his fourteen other principal plays, in beautiful type, for 3 cents. At Three Cents. the same price you may have Macaulay's "Life of Frederick the Great," former price $1.25, or Carlyle's "Robert Burns," or Lamartine's "Life Washington Irving. of Mary Queen of Scots," or Thomas Hughes's "Manliness of Christ." Washington Irving's wonderful, delightful, heretofore inaccessible "Sketch Book," which contains the incomparable Rip Van Winkle, you can have for a dime. For the same price A Dime. Tom Brown we will give you "Tom Brown at Rugby," the best boy's book ever written, except "Robinson Crusoe," which you can have also Crusoe. for 10 cents. To charm those who delight in fiction, we give also for 10 cents each, Cooper's "Last of the Cooper's Mohicans," one of the most justly celebrated American novels, and Charles Kingsley's "Hypatia," Mohicans. which worthily ranks at the very front of famous historical fiction. These are only specimens of the cheap books we publish, are all in good type, neatly printed, and are not in the broad side or any other "side" or "square" style, but handy pocket volumes, of course in paper binding. Our motto, however, has always been that a book worth reading is worth preserving, as well as worth owning, and our large list of standard books, to which we are making additions, with speed unprecedented in the history of publishing, are all elegantly and strongly bound, in cloth or better style, and sold at prices proportionately low with those in paper covers. We issue these few only in pamphlet form, as specimens of the quality of our good literature, and these special terms will not be long continued. 5,000 Booksellers throughout the United States and Canada are prepared to either abundantly supply or liberally slander our publications. We give liberal terms to clubs where no bookseller acts as agent. Descriptive Catalogue, and illustrated pamphlet describing book-making and type-setting by steam, will be sent free, on request AMERICAN BOOK EXCHANGE, 764 Broadway, New York.
JOHN B. ALDEN, Manager.

Agents Wanted.

AGENTS WANTED EVERYWHERE to sell the best Family Knitting Machine ever invented. Will knit a pair of stockings, with Heel and Toe complete, in 20 minutes. It will also knit a great variety of fancy work for which there is always a ready market. Send for circular and terms to the Twombly Knitting Machine Co., 409 Washington Street, Boston, Mass.

$100 A MONTH for Agents on our new Book: THE GOLDEN DAWN; or Light on the Great Future. Send for Circular. Also send address of 2 or more Book Agents, and 10 cents for cost of mailing, and receive The People's Magazine for 6 months. P. W. ZIEGLER & CO., 915 Arch St., Philadelphia, Pa.

$5 to $20 per day at home. Samples worth $5 free Address Stinson & Co., Portland, Maine

Miscellaneous.

CARPETS.

MOQUETTE CARPETS.—We have just placed on sale 300 pieces American Moquette Carpets at the low price of $1.40 per yard—the cheapest carpets ever offered. They cannot be had elsewhere in the city.

WILTON CARPETS at $2.25, full five-frame, and equal in quality to anything offered in this market at $2.75 or $3 per yard.

News of the Week.

HOME NEWS.

MONDAY, May 16, 1881.

As we go to press telegraphic reports announce the resignation of Senators Conkling and Platt from their seats in the United States Senate.

IT is stated that the President is anxious to consider a practical and speedy plan of dealing with the Mormon question. The recent attacks of the Mormon leaders on Governor Murray of Utah, and General Bane, have excited considerable feeling in the President's mind. Senator Logan, to whom the President confided the championship of the anti-polygamy policy in the senate is actively considering legislation.

The New York musical festival just closed, scored a great success. In no particular was failure written against it. The seven concerts were attended by more than 80,000 people. The receipts were between $80,000 and $90,000, and the expenses about $10,000 less. The music was of a high order and satisfactorily rendered.

One of Green's coal shafts at Carbondale, Kansas, caught fire on the 6th inst consuming all the timbering at the foot of the shaft. There were twenty miners at work and none could escape until the fire was extinguished. Men were then lowered down the shaft and rescued fourteen of them alive. Three were dead and three cannot be found and are probably dead. Several of the rescued were badly suffocated.

The first batch of copies of the revised New Testament have been received in this city for distribution this month to persons who have contributed ten dollars or more to the expenses of the revision incurred by members of the American committee. About eleven hundred persons living in different parts of the country are down on the list of contributors. The total amount contributed up to March 1, 1880, was $32,234 88.

The Rev. Dr. Edwards of Chicago is an enthusiastic bicycle rider. He spins into the city from his home in a suburb, nearly every day, and attracts much attention. He intends next Summer to make a bicycle tour of England.

The late General Emory Upton left an estate worth more than thirty thousand dollars, consisting of an interest in a rolling mill at Battle Creek, Mich., a place upon the Hudson near West Point, and considerable personal property. The income from his tactics is about one thousand dollars per year. His principal heir is his sister Sarah.

The mayor of Cincinnati issued a general order on the 7th, for saloons to be closed on Sunday, but the saloon keepers held a meeting and resolved to keep open, and every saloon was running Sunday. There are 1,500 saloon keepers in the city, six times as many as there are police, and they feel confident that they can successfully resist the authorities.

D. O. Mills, of San Francisco, told Hester Brothers, of New York to furnish the New York residence of his daughter, who has just married Whitelaw Reid, in their own way. Their bill was $460,000, which he declines to pay.

There is a little righteous indignation on the part of some congressmen because Senator Conkling who was seemingly much devoted to upholding the "eternal principles" during the deadlock, now says his action was simply to allow the President to withdraw Robertson's nomination.

The people of Springfield, Ill., amply made up for the snobbery which led the hotel keepers of that place to refuse recommendations to the Fisk University Jubilee Singers. They entertained them at their private houses, and ex-Gov. John M. Palmer preceded their concert with an address of welcome. When there is added to this local demonstration President Garfield's statement that he would invite the singers to the White House if the Washington hotels should decline to take them, the Springfield tavern keepers may begin to discover that the guests of Queen Victoria, the Emperor of Germany, and Mr. Gladstone are not unworthy to enter their establishments.

The plans for a new capitol building at Austin, Texas, have been accepted. The Legislature appropriated $1,500,000 for the purpose, but experts say it will take $3,000,000 if the selected design is followed. Wonder if it will be modeled after ours!

It is believed that the postal revenue for the year will exceed $36,000,000, which is $4,000,000 more than the estimate 18 months ago. The excess is due to the revival of business.

President Garfield has been presented with a letter from President Grevy, acknowledging and accepting the invitation extended to France to attend the centennial anniversary of the battle of Yorktown, October 19th next.

A reinforcement of Mormons arrived at New York recently, 200 strong, under charge of 10 elders, and bound for Salt Lake. They have arrived in time to take part in the rowing up Salt River, which President Garfield is desirous of giving the whole Mormon multitude.

The Cowpens Monument was unveiled at Spartansburg, S. C., on the 11th inst., in the presence of 20,000 people. Gov. Hagood, of South Carolina, presided. The Rev. A. Toomer Porter, of Charleston, opened the proceedings with prayer, reading from a prayer-book found on the battle-field. Thirteen hundred volunteer troops of the State of South Carolina were reviewed by Gen. Henry Hunt, U. S. Army. The granite base and pedestal of the monument were built by the joint contributions of the old 13 States and Tennessee, and the bronze statue of Morgan on top was contributed by Congress and made by Ward.

Prof. Richard A. Proctor, the English astronomer, and Mrs. Sallie D. Crowley, of St. Louis, were married recently. The church was filled with an unusually brilliant assemblage. The bride is a daughter of Charles M. Thompson, of St. Louis, and a niece of Gen. Jeff. Thompson, of Confederate fame.

The strange spectacle of a church floating down a river was seen during the prevalence of the recent floods in Dakota. It was constructed of strong timbers securely fastened, and as it floated down the Missouri the bell in its steeple could be heard above the roar of the flood and crashing of the ice.

The Burlington, Cedar Rapids and Northern Railroad Company propose to take paternal care of their employes, who will be required to sign a pledge of abstinence from liquor, billiards and profanity, and to give the company the right to pay their debts, deducting the amounts from their monthly wages.

Scribner & Co. announce their change of name to "The Century Co.," and "Scribner's" is to be known as "The Century." The change will take place probably some time during the coming Autumn. Wonder if the hieroglyphic cover will be retained!

Boston wants to show New York how to do it. Rumors are afloat that a project for a World's Fair at the "Hub" will soon be set on foot. Well, Boston being one of the suburbs of New York, will be a good place for the Fair, and we won't have to bother with it!

It is stated that a contract has been made with the Wilson line of steamers by parties in Norway and Sweden to transport 50,000 Scandinavians to this country this Summer.

Three colleges are in trouble for various reasons. The academic department of the New York University has been abolished by a vote of its council, at Dartmouth College President Bartlett is at loggerheads with the faculty over the matter of the lecture system, and at Cornell University Acting President Russel has been requested to resign for certain ill-defined, personal reasons. What next!

The first "hot wave" of the season came upon us on the 11th and 12th insts. Several cases of insolation are reported, the most from this city. At Troy, N. Y., the mercury marked 98° and in this city 91°. At Chicago the heat was oppressive, men and horses being overcome with the heat. At Toronto, Canada, the thermometer registered the highest temperature for May since 1841, viz: 90°. Port Jervis, N. Y., 100°.

Mr. Stanley Matthews has been confirmed Associate Justice of the Supreme Court by one majority. Had Senator Anthony, who was against confirmation, not left the room just previous to the balloting the vote would have been a tie, and Mr. Matthews defeated by the chairman's vote. The President will not withdraw the nomination of Robertson for Collector of the Port, and it will probably be confirmed soon.

Dreadful Paroxysms of Asthma.

"I was having *dreadful paroxysms of Asthma* when the Compound Oxygen came. I am very grateful to inform you that in that respect I am greatly relieved." Treatise on "Compound Oxygen" sent free. DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

AGRICULTURAL NEWS.

THE known exports of oleomargarine from this port last year amounted to 11,000,000 pounds, of which Rotterdam took nearly 7,000,000 pounds and Glasgow 1,500,000 pounds.....Assemblyman Crasper, of this State, has captured the four cheese factories at Gouverneur for the manufacture of cheese adulterated with lard, but a full-cream cheese factory is about to be started there, too.....There are now over forty butter creameries in Iowa, and about the same number in Wisconsin. They are organized on the Fairlamb system of gathering the cream daily from the farm, paying for it monthly by the inch. The price has ranged in the past year from 12 to 20 cents per inch, the average being about 16 cents per inch.....The Cincinnati Gazette announces it has some good Blount corn for sale for a friend at 25 cents per pound and postage.....In 1792 France and England had each 150,000 land owners, To-day France has 600,000; England, it is asserted, only 30,000..... ...The latest advices from the Northwest say that sickly Winter wheat has recuperated wonderfully under the stimulating influence of the late mild weather.....The Denver (Col.) Inter-Ocean says that enough alfalfa has been sold in that State this year to seed 10,000 acres, which next year will give an increase of 60,000 tons of hay worth $1,250,000, estimating the yield at six tons an acre. On some farms near Denver it has produced eight and nine tons..... John Archer, a vigorous farmer of 45, living at Randolph, in this State, died early last week, in the opinion of his physicians, from poison received into his system while spreading a prepared phosphate on a field. He perspired freely and the poison, it is thought, was taken in through the pores of the skin and into the lungs. It is claimed that when animals die of certain malignant diseases, the poison penetrates even their bones and may be retained in the phosphate prepared from them.....Capt. J. J. Claque, Commissary of Subsistence, sent by Gen. Terry to investigate the losses and destitution caused by the floods in the Missouri Valley, has made his report. In his statement he says that from the mouth of the Big Sioux River to Yankton, the bottom land on both sides of the river was covered with water its entire width, and looked like an inland sea, with occasional huge drifts of black ice somewhat resembling lava beds. Such sudden and merciless destruction is seldom witnessed in a life-time. On the Dakota side alone it is estimated that about 225,000 acres of fertile land were submerged. Some idea of the destruction may be conceived when it is known that here was one of the oldest and most prosperous settlements in Dakota, said to average a family to about every 20 acres, and having a railroad traversing its length for about 50 miles, passing through six thrifty villages, now all submerged with water or entirely washed away, Elk Point Station suffering the least on account of its elevation. It may safely be said that no one living on this bottom was left free from serious loss, many having their all swept away—lands, houses, grain and stock. On the Nebraska side the destruction was much less, as the bottom was not so thickly settled, and did not contain so much land. The most wonderful thing in this whole catastrophe is the small loss of human life.....George Morton, a Canadian cheese exporter, will undertake a scheme for a great dairy colony in the Northwest. There are to be 224 farms of 160 acres each, stocked at the outset with thirty cows each. The novelty will be a narrow-guage railroad, with a station on each farm, so that milk can be carried to a central cheese factory twice a day..... Four car loads of California oranges arrived in Chicago on the 13th. They were in good condition and came from a 400-acre orange farm near Los Angeles. More are coming. The promises of orange culture in the Golden State are now being fulfilled.

Mr. Conlan of Talbot Co, Maryland, is unhappy because in his orchard of 1,000 peach trees one-third of the buds have unexpectedly blossomed. On examination of his trees some weeks ago every bud appeared to be killed, and in his discouragement he offered to sell the entire prospective crop for $5. Mr. McCaffrey, a blacksmith promptly accepted the offer, had the crop transferred in legal form, and now even in the joy of his good luck he stubbornly refuses to share any part of it with the disconsolate Conlan. It is said that if one bud out of five bears fruit, a fair crop is assured—which will probably account for the frequent heavy crops after assurances that the buds had all been killed....

Sussex cattle have at last got an English Herd Book.....English papers tell of a large number of grocers in various towns who are hauled before the magistrates and fined for selling "butterino" for butter... ....The Peasant League is the name of an Austrian association of agriculturists which is asserting the rights of the tillers of the soil.... ....According to Buenos Ayres advices of March 14, six weeks of dry weather were causing farmers and stockmen to fear a winter drought. All the bullock carts in the country were busy taking to the "outside camps" posts and wire fences to inclose new stock ranges starting in all directions. Estrancias, or ranges, 24 leagues in extent were being inclosed by their owners, and land was rapidly rising in value owing to a large immigration—mostly from Southern Europe—and to the development of the country.....Australian news of March 5, tells of a rat plague in Queensland. Many lambs were killed by the vermin, which were doing a world of other mischief.....In New South Wales the wool statistics for the season show an increase of 34,703 bales.....In Sidney the weather was fine and pastures abundant, though it was the second month in the Summer. From nearly all quarters reports about grain were satisfactory.....In Victoria the rabbit nuisance had triumphed over Government control. Guns, traps, dogs and poison were seldom able to protect the crops from the famishing pests.....

The Indiana Short-horn Herders' Association meets at Indianapolis, Tuesday, May 24. The State Wool-growers association convenes at the same place and time.....Georgia farmers have been heavily importing Northern and Western hay, buying at $1 45 per 100. Much Western corn at $1 to $1 15 per bushel, is also being purchased, which Commissioner Henderson regards as a bad sign for Southern planters.....In 1874 Georgia planters used 50,000 tons of commercial fertilizers; this year 150,000 were sold. The acreage of wheat and oats in Georgia is short, but such grain as is planted looks well. Corn is 20 days behind, but the acreage is large.....Southern reports from North Carolina to Texas show a considerable increase in the acreage of cotton, the gain in Georgia being estimated at from 20 to 25 per cent. For the last fortnight the weather has been unusually favorable and the young plants promise fine crops. Corn is being neglected greatly for cotton, ..On May 13 snow was still deep in many parts of the Catskill region, N. Y. Near Gibbon a row of cherry trees were in full bloom standing in a snow bank five or six feet deep.... ...The peach trees in Southampton County, Va., are so full of blossoms that it is feared the matured fruit will break the branches.....Partial records of the live stock interests of Texas show a yearly yield of something over 400,000 head of cattle. Eight dollars per head is about the average market price at San Antonio... ....A telegram from Worthington, Iowa, on May 13, says a storm that afternoon lifted the barn of John Pitman, containing six horses, and carried it a distance of half a mile without injury to the horses; also, two barns belonging to R. Baker were blown a distance of two miles. No lives were reported lost.....In the Illinois House of Representatives the bill prohibiting all railroads in that State from changing their rates of freight without first giving sixty days' notice of the change by posting the same in every station along the line, under heavy penalties, was passed last Friday.....Last Thursday the New York Legislature passed the anti-oleomargarine bill.... ....At Baltimore, May 13, George H. Williams, attorney for the Agricultural and Mechanical Society of Western Maryland at Cumberland, filed his declaration to the suit against Beecher. The declaration alleges that in July, 1878, Beecher agreed for $300 and his expenses to deliver an address for the benefit of the society at its fair on October 23, 1878; that by reason of said agreement the plaintiff was obliged to spend large sums of money in advertising to induce a great attendance of visitors, and large sums to accommodate them, which would not have been expended but for the agreement made with Beecher; that Beecher utterly disregarded his agreement and contract without pretence of excuse. Wherefore the plaintiff claims $10,000 damages.

In December last Nelson Morris, of Chicago, shipped from Baltimore on the Spanish steamer Enrique a number of cattle for Liverpool. During the voyage the vessel encountered severe gales, and it is charged that 126 head of the cattle were thrown overboard. Subsequently Mr. Morris libeled the Enrique, bringing suit to recover $7,500, the estimated value of the cattle lost. Judge Morris, in the United States District Court, filed his opinion in the case last Thursday, dismissing the bill, the bill of lading signed by the agent of the shipper of the cattle having stipulated that the cattle were to be carried on the upper deck and that the steamship owners should not be responsible for any loss that might arise through the cattle being washed overboard or jettisoned .....A New Orleans report says that the Anchor line of steamers are about to take eight of their largest vessels out of trade between our Atlantic ports and Europe and run them between New Orleans and Liverpool. The great increase of grain shipments down the Mississippi is the cause of the transfer...

Rates of lake freights from Chicago to Buffalo opened at 5c. for Wheat and 4½c. for Corn per bushel.....Ocean freights hence to Liverpool have been for a few days 1½@2d, but higher rates are demanded, caused by the expected arrival this week of about 5½ million bushels of grain that was frozen in the canal last Fall.....A Detroit paper of May 4 has reports of the wheat crop from 33 counties out of the 77 in Michigan: of 91 towns 17 report an average; 1, fair average; 2, low average; 33, ¾ crop; 4, ½ crop; 1, 3-5 crop; 6, ⅔ crop; 14, 2-3 crop; 1,30 per cent under average; 2, 2-3 to ¾ crop; 2, ½ to 1-3 crop; 4, average 8 to 10 bushels per acre; 1, considerably injured; 1, poor; one, bad condition. Rains and warm weather have since probably improved the outlook.

A telegram from Washington yesterday says that the investigation made by direction of the Department of State, with a view to correct the exaggerated reports circulated in Europe concerning hog cholera and trichinæ among American swine, has resulted in the following conclusions: That American swine are of the best and purest breeds and are fed and fattened for market on corn; that the reports published in Europe concerning the deaths of American hogs from hog cholera are gross exaggerations; that American hogs which have died or may die of cholera or from any other cause can have no relation to the meat product except to decrease it, as such animals cannot by any possibility pass the severe scrutiny and inspection to which hogs destined for killing and curing are subject; that, even if it were possible to pass such inspection, no art of the curer could convert such animals into meat which could pass the inspection even of a blind man; that the merchantable lard cannot be produced from animals which die of hog cholera or from any other cause; that the freedom from trichinosis of the two great pork-consuming centers of the West, Chicago and Cincinnati, furnishes the strongest possible evidence of the purity of American pork; that the reported cases of trichinosis have resulted from eating uncooked meat, shown to be inferior or rejected, and that thorough cooking entirely destroys this parasite and removes all danger in this regard from eating pork.....Certain returns just made in England in reference to 16 counties show that farms are going a-begging. There are no tenants to take them. Good land in the fen district of Huntingdonshire, which formerly—five or seven years ago—brought from 32 to 40 shillings per acre, is now let with difficulty at from 15 to 25 shillings; clay land, which let at 30 shillings may now be had at from seven to ten, if any one can be got to take it. In Leicestershire things are not much better. A farm of 150 acres, half grass, which had been let for 30 years at 35 shillings an acre, has just been relet for 20 shillings..... ...The Mark Lane Express of last Monday says: "Wheat has but slightly progressed, severe night frosts retarding it. Its appearance, however, remains healthy, and the crop prospects are favorable."

THE French Government has largely enlarged the bounties to French shipping, with a view to increase the French mercantile navy, and Bismarck has just laid before the German Reichstag a paper on these bounties, in which the action just taken by France is made the basis of a suggestion that Germany must enter upon the same course. This paper states the French shipping bounties at $1,800,000 annually; English, mainly in postal subsidies, at $3,205 000; Italy, $1,800,000; Austria-Hungary, $1,085,000; Belgium, $185,000; Netherlands, $65,000; and Germany only $50,000. The United States at present pays nothing but ocean postage to mail steamers, and it practically supports its consular service abroad off American shipping.

His Last Dose.

Said a sufferer from kidney-trouble when asked to try Kidney-Wort for a remedy. "I'll try it, but it will be my last dose." It cured him and now he recommends it to all. If you have disordered urine don't fail to try it.—Yokohama Dispatch.

Thousands of ladies to-day cherish grateful remembrances of the help derived from the use of Lydia E. Pinkham's Vegetable Compound. It positively cures all female complaints. Send to Mrs. Lydia E. Pinkham 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

No health with inactive liver and urinary organs without Hop Bitters.

BURNETT'S COCOAINE,

The Best and Cheapest Hair Dressing.

It kills dandruff, allays irritation, and promote a vigorous growth of the Hair.

Burnett's Flavoring Extracts are invariably acknowledged the purest and best.

The Markets.

CHEESE Prime new factory sells at 10@11c, and common at 8@9c per lb. Eggs mainly at 10c per dozen for round lots, but small sales are made to the local trade at 10½@10¾c per dozen. SEED. Flaxseed is steady at $1 10@1 12½ per bushel. German Millet sells at $2 25, common Millet at $1 50, and Hungarian Grass at $1 25 per bushel.

Nothing purifies and enriches the blood and destroys all poisons in the system like Hop Bitters.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 14, 1881.

BEANS AND PEAS.—The bean market is very quiet and prices are easier; still there are no free sellers at the cheaper rates. Wants of local consumers are small and Cuban buyers say they cannot operate at high figures. Green peas dull and lower; Wis. $1.50@1 55; Southern B. E. $3.25.

Medium beans, prime, $2.50@2.55; other, $2.20@2.45; marrow, prime, $2.55@2.60; other, $2.35@2.45; white kidney and pea $2.25@2.40 red kidney, prime, $1.60@1.65, other, $1.40@1.50; black or turtle soup, $1.45@1.50; Lima, $5@5.50 nominal.

BUTTER—The market has ruled fairly strong on quotations. Sudden hot weather has hurt the showing of goods and many shipments from remote points will turn out badly. There is a showing of grass in many invoices, and that, of course makes a premium to sell white. Western is most irregular in quality.

New Butter.—Creamery, choice Western and Pa. 24@25c. other, 20@22c.; sweet cream, 20@24c.; State half tubs, choice, 22c.; fair to prime, 19@21c.; Welsh, choice, 22c.; other 19@21c.; very common or stale new 12@16c.; Western imitation creamery 16@22c.; do dairy 15@19c.; factory 9@14c.

Old Butter ranges 10@18c.

Receipts for week 28,081 pkgs.

Exports do. 2,800 do.

Receipts and exports of butter have run very uniformly for the past three years from June to date.

CHEESE.—The market is weak and tends in buyers' favor. Shippers seem to feel that prices opened above a reasonable prudence and they are in no hurry to operate largely.

State factory ranges from 10@12½c., fair to fine, 8½@9½c.; Ohio factory, 8½@11c.; skim, 3@7½c.

Receipts for week, 31,428 boxes.

Exports for week, 23,660 boxes.

Liverpool cable, 69s.

Steam to Liverpool 15@23s.

Trade has been more or less retarded by a strike among cheese coopers, or scalers as they are called.

COTTON. The market is quiet and weak at for May, 10.22@10 23c.; June, 10.28@10.29c.; July, 10 37@10 38c.; August, 10.45c; September, 10.20@10 21c.; October, 9 87@9.88c.. November, 9 75@9 77c.; December, 9.78@9.77c.; January, 9.87@9.89c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*N. Orleans and Gulf.*	*Texas*
Ordinary	6¾	7⅜	7¼

Good middling	11 1-16	11 5-16	11 5-16
Strict good middling	11 5-16	11 9-16	11 9-16
Middling Fair	12 1-16	12 5-16	12 5-16
Fair	12 13-16	13 1-16	13 1-16

DOMESTIC ESSENTIAL OILS.—Oil peppermint in tin $2 45@2 50; do. in glass $2 10; oil lemon $2.40@2.60; do. wintergreen $2 25@2 30; do. sassafrass 39@40c; oil penny royal $1@1.05.

DRIED FRUITS.—In apples evaporated stock has a fair demand and is firm in price, as also sun-dried lots. Peaches are quiet and firm. Small fruits are at steady prices. Quotations:

Evaporated apples at 8¾@9c. for prime and choice stock; sliced apples at 4¼@5¼c. for good to choice North Carolina; 4@4½c. for Va. apples, 4@4½c. for Tenn. do; 4¼@5c. for State do; 4¼@4¾c. for western, Ohio and Mich. Peaches at 28@29c. for evaporated peeled; 13½c. for unpeeled do; N. C. peeled at 19@22c.; for the better qualities of new and 12@13c. for old; unpeeled peaches at 5¼@5½c. for halves and 5½c. for quarters. Plums at 16@16c. Blackberries at 9c. for prime. Cherries at 15c. Raspberries at 24@26c. Whortleberries 11@11½c.

Receipts for the week, all kinds, 500 pkgs.

Exports dried apples, 2,400 pkgs.

EGGS—Receipts for week, 21,413 bbls.; do. last week 24,100 pkgs. Supplies are large, the weather hot and buyers begin to clamor for "loss of." Southern eggs are losing badly. Prices have dropped to a speculative point but there is not much buying for above use with July weather in May.

Near points, 13½c.; State and Pa., 12½@13c.; Western, 12@12½c.; Southern, 11@12½c.; poorly packed, and small run 11c.; goose 20@22c. duck, 14@15c.

FLOUR—Demand is very good, but the increased receipts, low grain prices and the warm weather injuring stock, prices show a decline.

Quotations are: $3.90@4.55 for very inferior to very fancy superfine State and Western; $4.50@4.65 for poor to choice extra State and Western, odd lots and lines; $4.65@4.85 for choice to fancy do.; inferior to good white wheat, trade and family extras, $4.60@5.50; good to choice do. at $5.50@6.35; (very choice up to $6.50 and fancy at $6.75;) red and amber winter wheat inferior to choice trade and family at $4.60@6.15; round hoop Ohio, $4.60@4 90; and trade and family brands of do. at $5.00@6.25, the latter for very choice; St. Louis $4.75@5.65 for inferior to good extra, $5.65@6.50 for good to very choice, and up to $6.65@7.00 for very choice to very fancy brands; Minn. clear, inferior to very choice at $4.75@5.75; Minnesota "straight," poor to very choice, at $5 35@6.75, and "patent" inferior to fancy at $5.75@7.75; city mill extra at $5.75@5.85 for the West Indies; do. for England at $4.50@4.85 for poor to choice spring wheat; do. trade and family extras, $5.75@6.75; do. for South America, $5.85@6.10, the latter for very choice; No. 2 at $3 00@3.55 for poor to fancy.

Receipts for week, flour, bbls. 83,625; corn meal, do. 3,925; wheat, bush., 855,650, corn, do. 542,800; oats do. 175,800; rye, do. 19,300; malt, do. 68,400; barley, do. 12,650; beans, do., 5,438 rice, pkgs. 650.

Exports for week, flour, bbls. 50,300; corn meal, do. 4 200 wheat, bush. 707,900; corn, do. 358,900; oats, do. 4,400; peas, do. 2,150; beans, pkgs. 605; rice do. 800.

FRESH FRUITS.—Apples have only achance trade with a range of 50c.@$4.25 ₩ bbl. for common to best. Since our last, at Albany the Hon. J. Stanley attempted to revive the Apple-Barrel bill by reconsideration of the vote whereby the act fixing a standard size of apple-barrels was rejected. The motion to reconsider was lost and the apple-barrel question settled for this session. Cranberries are a drug at 50c.@$1 per crate. Strawberries are an important feature; Charleston is sending some fine Young American. New York and N. C. 25@35c.; Charleston and Florida, 25@35c.; poor, 15@20c. Hot-house grapes—Black Hamburgs, $2 ₩ lb. Peanuts have a fair sale at firm prices; Va. hand-picked 4¼@4¾c.; other, 3¾@4¼c; shelled, 3@3¼c; pecans 7@8c.

GRAIN.—Wheat has declined on the average respecting the crops, which are unusually promising Latest sales are for

No. 1 white at $1.24¾@1.25¼, do. May at $1.22¾@1.22¾; do. June at $1 19; do. July at $1.18¾; do steamer grade at $1.22@1.22¾; No. 2 white at $1.22@1.22¾; ungraded white at $1 18@1.22 No. 1 red at $1.29¼@1.30; No. 2 red at $1.25¼; do. May at $1.23¾; do. June at $1.21@1.21¾; do. July at $1.18¾@1.19; do. August at $1.15; No. 3 red at $1.21¾@1.22¾; ungraded red at $1.14@$1.27; No. 2 Chicago Spring at $1.22¾@1.23; No. 3 spring at $1.16.

Corn is freely offered at lower prices latest prices are for

New York No. 2 at 59½@60c.; do May at 56½@56¾c.; do. June at 54@54¼c; do. July at 54¼@54¾c.; do. August at 54¾@55c.; No. 3 at 56¾@56¾c.; ungraded mixed Western at 54@56c; New York steamer mixed at 58c.; No. 2 white at 58¾c; white Southern at 54¾c; damaged corn at 38@52c.

Oats are in very good demand and realizing an advance; latest prices are for

No. 1 white at 55c.; New York No. 2 white at 53@53¾c.; No. 3 white at 50@50½c.; New York No. 2 at 46¾@47c.; do. May at 46¾@46¾c.; do. June at 45¾c.; do. July at 45¼@45½c.; do. August at 39½@39¾c.; No. 3 at 46c.; ungraded white Western, at 47@50c.; ungraded mixed Western at 46@47½c.; white State at 53@55c.; No. 2 Chicago at 47c. asked

HOPS.—The demand from brewers has improved slightly; the export trade is quiet. Prices are held firmly. Quotations

Exports for week, 495 bales.

Receipts for week, 904 bales.

HAY AND STRAW.—For hay demand is fair, but with large receipts prices are easy. Straw is in fair demand. Quotations are for

Prime timothy hay at $1.05@1.10 ₩ 100 lbs.; medium timothy at 90c.@$1.00 do.; shipping grades at 80@85c. do.; clover mixed at 90@95c, clover at 70@80c. do. Straw—No. 1 rye at $1.10@1.15 ₩ 100 lbs.; No. 2 rye at 60@65c. do.; oat and wheat at 45@55c. do.

Exports for week, 1,787 bales.

POULTRY AND GAME.—Frozen dressed turkeys have nearly run out, and very little fresh dressed of good quality is here. Market full for choice and weak for other grades. Chickens are plentier as N. J. begins to ship. Ducks dull.

Turkeys, prime fresh and frozen 18@19c.; good 16@18c.; large coarse 12@13c; chickens Spring 60@80c; Winter 30@60c; Fall 20@23c; fowls d. p. 16@17c.; scalded 13@15c, capons out of market; Ducks, choice, 25c.; other, 15@20c.; Squabs, white, $3.75@4 ₩ doz.; do, dark, $1.75@2.21.

Cooped fowls have been scarce and prices are strong. Spring chickens easier. Ducks and geese still offered at the recent decline.

Fowls, 14@15c.; roosters, 9@10c.; turkeys, 13@14c.; Spring chicks per pair, 75c.@$1.50; ducks, 60c.@$1.00; geese, 75c@$1.75 pigeons, 35@50c.

In game a few wild squab quoted $2.25@2.50; Eng. snipe $2.25@2.50 per doz; plover $2@2.25; sand snipe 50c.

PROVISIONS.—Hog products have been fairly active firm.

Mess pork quoted at $16 for old and $16.75@17 for new. Bacon at 8¾c. for long clear and 9¾c. for short clear. Lard—Western steam at 10.90 for spot 10 85 for June 10.83½ for July, August, and Sept. Tallow at 6¾@6 9-16 for prime. Stearine at 13 Beef hams at $22.50@23.50. Beef at for extra India mess, at $23 50@24.50 for city. $11.50@12 for extra mess; nominal for plain mess; packet at $12@13.

Receipts for week, beef, bbls and tcs, 1,750; pork, bbls, 650; cut-meats, pkgs, 8 835; lard do. 9 691.

Exports for week, beef bbls. and tcs., 1 800; pork, do. 3,250; cut-meats, lbs. 4,570,753; lard, do. 4,055,850.

SEED.—Clover is quiet at 8¾@9c. Timothy is firm at $2.90@3.

TOBACCO.—Export trade is moderate and the home demand fair, with prices generally firm.

VEGETABLES.—Potatoes begin to break in prices' Many begin to sprout, and besides green stuff is now plenty enough to call off a large portion of local trade. Sweets not wanted.

Bermuda potatoes $7@8 ₩ bbl.; Florida, $3@7; Early Rose, Nova Scotia d. h. $2 50. Maine $2.50@State, $2.12; do. bulk, $2@2.50; Prolific, $2 87 Mercer, $2@2 25 Jackson White, d.-h., $2.25; Burbank, d.-h. $2 25@2.50; do. bulk, $2 25@2 50; Snowflake $2; do. d.-h. $2 50, peachblow do. $2 25@2 75; Peerless, $2@2.12; sweet Del. $1@2.

The weather has been severe upon tender sorts of Southern garden truck and the range of prices is consequently wide.

Florida cucumbers, per crate $1.10@4; North Carolina green peas ₩ ½ bbl 75c@$1.50; Sav. do. 25@50c. ₩ crate; Charleston do. 25@50c; Fla. tomatoes, $2@3.50; Bermuda do. boxes, 50@75c; Fla. squashes ₩ crate $1@1.25; cauliflower do. $@4 ₩ bbl. cabbages $2@3; Fla. beets $1,25@1.50 ₩ crate; Bermuda onions. $1@1.12 ₩ crate; Fla carrots $3 50@4 ₩ 100 bunches W. turnips, N. C. $3@4; do. radishes, 25@50c. ₩ 100 bunches; asparagus, Oyster Bay $1 50 ₩ doz.; other, 75@$1 25; rhubarb L. I. $1@1.50 ₩ 100 bunches; old turnips 25@50c. ₩ bbl.; beets 75c.@$1; Hubbard and marrow squash $1.75 ₩ bbl.; carrots, $1@1.50; onions, red, $1@1.50 lettuce $2@2.50; Southern string beans, $2@4.50 ₩ bbl. Hot-house mushrooms $1 ₩ lb.; cucumbers 75c@2.25 ₩ doz.

WOOL.—The market has been very quiet the past week; not much life is expected until the new clips come in; prices are held steady.

LIVE STOCK MARKETS.

NEW YORK, Saturday, May 14, 1881.

BEEVES.—Receipts for the week 12,971 head; do. last week, 10,997 do. Cattle rule high though showing a falling off since the early part of the week. Market closes with a weak tendency. Col. stillers sold at 11c. to dress 56 lbs.; native do. 10@11¼c. to dress 56 lbs. fat still bulls 4¾@5c. live weight; corn-fed steers 10c. to dress 56 lbs. 10 12c. to dress 57 lbs.

SHEEP AND LAMBS.—Receipts for the week 20,093 head; do. last week, 26,980 do. Demand for sheep moderate at 5@5¾c. for clipped. No wool sheep arriving. Lambs are plenty and easy; Va. Spring 8¾@9c. ₩ lb.; N. J. $3@5.75 ₩ head.

MILCH COWS.—There is a steadier tone but with the small supplies the market is unimportant; common to good cows have sold during the week at $55@55 per head; a few picked at $60.

SWINE.—Receipts for the week, 25,812 head; do. last week 28,820 do. Market weak at $6 @6.25 per 100. City dressed State 7¾@8¾c.; do. Western 7¾@7¾c.

VEAL CALVES.—Live are steady but low. Few exceed 6c. Near point, up-river, hog dressed are the only dead worth quoting these being, 7¾@8¼ fair to choice. Live milk-fed choice 5¾@6; fair to prime 5@6c; poor 4@4¾c; buttermilk 3@3½c; Mt. Holly calves 6@7c, 220 to 160 lbs.

We have *hundreds* of letters like the following:

LIME ROCK, Conn., April 30th, 1881.

Gentlemen—Please accept thanks for the beautiful Tea Set, which is much nicer than I expected, and indeed it is surprising to every one how you can do so much for so little. All are so well satisfied with the Tea that I think you will receive another order soon.

Yours truly, MRS. A. THORPE.

TAUNTON, Mass., March 8, 1881.

Gentlemen—I have forwarded eight different orders for Tea, and have received as premiums a tea set, a silver-plated caster, a dinner set, a glass set, a case of silver-plated knives and forks, a pair of French china fruit dishes, and *two ladies gold watches*, and am now on my ninth order. Both Tea and premiums I am well pleased with, and have found perfect satisfaction with both. Yours truly.

MRS. MARIA C. LYNCH.

Orders, with P. O. Order, or money enclosed in registered letter can be sent at our risk. All checks or Post Office orders should be made payable to F. M. LINNELL.

We also send Teas by mail, Without premium, postage paid, at list prices, to those who wish for choice goods and are so situated they cannot obtain them at home. For full price and premium list, send us postal, with address PLAINLY WRITTEN,

FARMING FOR BOYS AND GIRLS—NO. 22.

HENRY STEWART.

Feeding Crops.

AMERICAN farming is different from that of any other country. We have the rough and ready methods used in countries that are only partly civilized and also those highly skilled methods practiced in England and other lands where the soil is cultivated in the most skillful manner. In our vast and almost boundless territory which we call the great West, our system of growing crops is very simple. The soil is plowed and sown with wheat or corn for several years and all the produce is sold. This is kept up as long as the rich soil will grow crops with profit and then a change must be made. Instead of growing crops for sale, feeding crops must be grown; stock must be kept to consume these crops; beef, mutton, wool, pork, butter, cheese or milk must be produced for sale and manure made to keep the farm in a productive condition.

It is fortunate for the farmer if he makes this change before the land is so worn down that it will not produce sufficient crops to support him with comfort. Many farms have, in past years, been so exhausted by long continued cropping that the farmers could not make a living upon them; their children have left the homes where they were born and have gone into distant places, and in course of a few years the lands have gone into the hands of new comers, who, at great expense only, have been able to make them productive again. To prevent such consequences, the farmer should begin in time to grow feeding crops and keep stock, by which the soil is kept fertile.

The crops usually grown for feeding are clover, grass, millet, tares, turnips, mangels, beets, fodder corn, oats and corn for grain. Besides these, hay and straw of rye, wheat, or barley, are fed or used as litter. In feeding these crops, it is the aim of the farmer to get back the market value of them with some profits to pay for the labor and cost of keeping the stock, and to have the manure left free without any cost. If this can be done a great advantage is gained, and the farm can be worked from year to year without losing any of the fertility of the soil, or may even be made richer and more productive. More labor is thus required than in growing grain, and there is less leisure for the farmer.

But labor is the basis of all wealth and nothing of value is ever gained without work. We are told by the wise man that "in all labor there is profit," that is, true labor, which is labor wisely spent and rightly directed. And in this labor of growing feeding crops there are several things that must be done right or we cannot secure the ends we are aiming at; for instance, we must grow the right crops and in the best manner, and we must feed them to the best kinds of stock in the best manner. So that the farmer who keeps stock in the hope of making a profit from them, must study and learn and know what are the right crops to be grown and how they should be grown; and also know which are the best kinds of stock to choose for feeding these crops to; and lastly, he must know all about the business of feeding animals, so that food is not wasted or ill spent.

THE YOUNG QUERIST.

"Experience," Hornellsville, N. Y., asks how to make tuberoses bloom.

ANS.—The bulbs should be potted and set to growing in March, if flowers are wanted in August. Remove the loose rind, offshoots, etc., from the main bulb, being careful not to injure it. In potting, mix a little fine compost with the soil and shake it down. Press the bulb down gently to within a quarter of an inch of its upper surface. Set the pots in a hot-bed until the plants are three or four inches high, then transfer them to the green-house and give them plenty of light, air and water. In June plant in open ground. While in the hot-bed keep the young plants shaded from the hot sun, cover with mats at night, and give them but little water. They should begin to flower the latter part of August.

M. F., Mondovi, Wis., asks if gladioli are often double, and if the same bulb which has produced double flowers will be apt to do so another year.

ANS.—Double gladioli are by no means common. We have seen both single and double flowers on different stalks from the same bulb and also on the same stalk. The bulb of a double gladiolus will probably produce double flowers again.

E. P., Perry Center, N. Y., asks how huckleberry bushes taken from a swamp should be cultivated. The RURAL, a few years since, spoke of huckleberry bushes laden with fruit, taken from a swamp.

ANS.—When transplanted the bushes should be cut down to within two or three inches of the ground, and as much soil transferred with the roots as possible. As yet huckleberry culture on high ground has not been generally successful.

M. P. B., Peoria, Kansas, asks, 1, how to take care of celery in the Winter, and, 2, how to raise seed from it.

ANS.—1. To store celery in large quantities, for the Winter, select a well-drained spot and in it dig a trench about a foot wide and of a depth a few inches less than the hight of the celery. In this set the plants closely together in an upright position. When cold weather comes cover the celery with leaves or straw and place boards on the top to keep out the moisture. The covering should be gradual to prevent heating and decay. When but a small quantity is raised it is a good plan to leave the plants standing where they have grown and earth up about two feet, and, in extremely cold weather, cover with leaves or straw. The celery tops should be dry when packed. 2. Celery for seed should be sown now and transplanted when two or three leaves appear.

NOTES.

THE children's Seed Distribution will be discontinued May 21st the date of this number of the RURAL. I hope to have interesting reports from all parts of the country next season, on the growing of the seeds of this Distribution. I am glad to say that nearly all our Pyrethum Roseum seeds have been applied for, and that a thorough trial of the same is promised by so many.

The packet of seeds from "Elsie" will be tested at the Rural Farm, as desired. We are always glad to receive any new or rare seeds of flowers, etc.

We wish to acknowledge the receipt of a nice box of California raisins and a pair of orange wood sleeve buttons from the talented writer of our "California Sketches." The raisins were made from grapes by drying the latter in the sun, and turning them but once.

In our "Queriet" of April 30th, A. L. P., asked if Briars Sweet Crab is a Winter fruit, to which query we could give no definite reply; but O. C. C. of Oconto, Wis., writes us that this apple ripens in August; is larger than the Transcendent and is one of the best, if not the best, there is. Thanks for the information.

Now, young friends, is the time to study the nature and habits of insects and animals, the growth of plants and flowers. Just by the roadside there may be many little flowers, fragrant and beautiful, whose names are unknown to you now. Why not study about them this Summer? And then the insects which cross your path as you go to school, what are they? What their habits? I am sure a vast amount of pleasure and much profit will be found in acquiring an exact knowledge of these "little things," and should you fail to name them everyone, you can forward them to this office and I may be able to assist you in your search. In sending plants for name be sure to send both leaves and flowers. U. M.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—I thought it would not be anything amiss for me to write and let you know how we get along in the Sunny South. As we read the RURAL, I never have seen anything from any of the cousins in Guilford, so I thought I would let you know that you have one, and a dear lover of the RURAL. I think it is the best paper that is published anywhere. We have had the severest Winter that was ever known in Guilford. The last of December and first of January the thermometer was 12 deg. below zero. Peach and apple trees were killed to the ground, and in many places the young trees in nurseries were killed. I have 30 different kinds of roses, besides a great many other flowers. I don't think any of the cousins have good ripe pears to eat, as they don't say anything about it, but I have, and have had all Winter, and would like to send one to Uncle Mark if they were not too mellow. The horticultural leech spoken about in "Woman's Column" we are acquainted with here, and he will stick to you, too, and if you try to knock him off he gets mad.

As ever your friend, E. J. A.
Centre, Guilford Co., N. C.

DEAR UNCLE MARK:—We have long wished to join the Horticultural Club, but mamma said that we must try and raise some flowers or vegetables first, so that she could see how well we would take care of them, before she would write to you. So last Spring sister and I took our money and bought some flower seed. I like zinnias the best so I bought them and balsams and pinks. Sister bought aster, candytuft and double portulaca seed. Mamma had a variety of other flowers and she let us have a place in the yard to plant our seeds and gave us some plants so that we might learn how to transplant flowers, and when the dry season set in she had us water them every evening and sometimes in the morning too; the result was we had nice flowers until late in the Fall and could cut a fresh bouquet every morning for papa's room for he has been laid up with paralysis since last July and could not come out to see how nicely our flowers were growing.

WILLIE AND GERTRUDE MARTIN.
Omph Ghent, Mad. Co., Ills.

DEAR UNCLE MARK:—Papa takes the RURAL and I read the letters from the cousins and have longed to join the Club. I am a little boy ten years old. Papa is a landscape and market gardener, so you may imagine we have plenty of flowers and vegetables and strawberries, which is true. I have planted a few ground peas and hope I will have success with them, I love them so well. I have two little brothers and only one sister. I am the eldest of the children. I have always said I wanted to be a preacher. What do you think of the idea? Some tell me I must not be. Please accept me as a member of your Club,

Your little friend, WILLIE B. DECKNER.
Atlanta, Ga.

[The desire to be a preacher—a minister of the Gospel—is a very worthy one, but your parents and friends can advise you best about preparing for that profession. Many things must be taken into consideration.—U. M.]

DEAR UNCLE MARK:—I have never written to you but once, and I thought I would try again and see what I could do. Last night my father was reading the cousins's letters and I thought as there were so many children asking to join the Horticultural Club, that I would like to join it too. My brothers and I have a little garden which we cultivated last year, and in which we planted mangels, cabbage, and other vegetables. Our mangels yielded a very large crop for the first time. Father and I took three horses, one colt, three head of cattle, six Golden Ovoid Mangels and six bunches of celery to the fair and received first premiums on all. The premiums amounted to $27. This Winter I have been feeding six sheep that are very tame. Two of them are mine, one is my brother's and the other three belong to Father.

Lamartine, Pa. WILLIE W. RUGH.

(Advertisement.)
[Rockford (Ill.) Register.]
Fell Against a Sharp Edge.
This is furnished by Mr. Wm. Will, 1613 Frankford Ave., Philadelphia, Pa.: Some time since I received a severe injury to my back, by falling against the sharp edge of a marble step, the stone penetrating it at least a half-inch, and leaving a very painful wound. After suffering for a time, I concluded to apply St. Jacobs Oil, and am pleased to say, that the results exceeded my expectations. It speedily allayed all pain and swelling and by continued use, made a perfect cure. I really think it the most efficacious liniment I ever used.

A CYCLOPÆDIA WAR.

An honored publishing house whose history is reputed to extend back into the last century, and whose wealth has been estimated at $8,000,000, is that of J. B. Lippincott & Co., Philadelphia. The largest and most important publication ever issued by them was in connection with the great publishing house of Chambers, of Edinburgh, Scotland, and London, England, that of Chambers's Encyclopædia, which, many years ago, they published at the price of $50, (so called) low afterwards reduced to $40, and some years later, as the result of a rupture with the British house, in consequence, (it was said) of the Lippincotts making changes in the American edition contrary to the spirit while still using the name of Chambers, the same Encyclopædia was brought down to the still lower price of $25. Now, in the glorious year 1881, moved, of course, not by the spirit of rivalry, but by the generous and laudable purpose of placing useful knowledge within reach of the people, without regard to the question of profit or of loss to themselves, they are issuing an edition of this same great work, Chambers's Encyclopædia, which *is said to be* revised to date (edition of 18-sixty something), which they are offering at the wonderfully low price of $15 for the work complete, in 10 great octavo volumes. Even at this astoundingly low price they allow the large discount of 40 per cent. when purchases are made in large quantity. The army of the Literary Revolution always rejoices at the multiplication of good books at low prices, and the AMERICAN BOOK EXCHANGE is delighted with the opportunity of uniting with the great publishing house of Lippincott in furthering the sale of this work; and to demonstrate the earnestness of their good-will they propose, so long as the Lippincotts choose to continue the manufacture at this nominal price, to furnish the public with the Lippincott edition at the low price of $3.50 per set, (the 50 cents for cost of handling,) delivered in New York city, or sent by express or freight to any part of the United States or Canada. Considering the munificent liberality of the Lippincotts' terms, it has seemed a great pity that their modesty should prevent them from advertising more widely, and we therefore supplement their generosity by scattering this advertisement broadcast for them at our expense.

The Literary Revolution

Has not the honor of a century's history, and its present cash capital is only about $175,000. It was started only so long ago as September, 1875, with $70 cash and a few old books, and two years thereafter had reached the dignity of a garret in an Ann Street junk shop, its "army" consisting of one man and a small boy and from the character of the place, *circa* (b-d b-ge) being far more numerous than customers for books. But by January, 1879, the Revolution had accumulated sufficient strength to print one small volume, which was increased to a product in 1880 of *over one million volumes*. Its business offices and retail store now occupy entire a magnificent six-story building on Broadway, and its factories several other buildings elsewhere in the city, and it gives employment to about 600 hands. One item of its present large list of standard publications is an edition of Chambers's Encyclopædia, in 15 handy, beautiful cloth-bound volumes, which it is selling at the low price of $6 per set, (lately reduced from $7.50). This edition is a verbatim reprint of the London edition of 1880 (instead of that of 18-sixty something, as in the case of the Lippincotts, with the alteration of a few census figures). Chambers's Encyclopædia, however, is a foreign work, and it could scarcely be expected that such a work, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies, we are now issuing under the Title of the "Library of Universal Knowledge," a new edition in fifteen large octavo volumes, large type, in which a large force of American editors and writers have added about 1,500 topics, covering about 3,000 octavo pages, thus thoroughly Americanizing the work, and making it nearly 40 per cent. larger than the original Chambers's, 10 per cent. larger than Appleton's, and 20 per cent. larger than Johnson's Cyclopædias. Of this edition, ten volumes are now ready for delivery. Volume XI. will be ready May 20, and the remaining volumes at intervals of a few days thereafter. Price per volume in cloth, $1; in half Russia, gilt top, $1.50.

Chambers's Encyclopaedia
$6.00.
Universal Knowledge
Triumphant

"First come, first served," is an old motto which we have supplemented by "Lowest prices to earliest purchasers," and accordingly, on this edition, we are *for a few days* offering *the ten volumes now published at the net price of* $8.75. This price will very shortly be increased.

Of course the 15,000 topics and 3,000 pages of new matter added to this edition are not to be found either in the Lippincott edition, nor in our own $6 edition. Both of them, however, are excellent works, remarkably cheap, and serve a good purpose for those who cannot afford the new and enlarged edition. Specimen pages, showing type, and giving full particulars, will be sent free on request. Throughout the United States and Canada are prepared to either abundantly supply or liberally slander our publications. We give liberal terms to clubs where no book-seller acts as agent. Descriptive catalogue and illustrated pamphlet describing book-making and type-setting by steam, will be sent free on request.

THE CHAMPION IMPORTED BREECH-LOADING SHOT GUN.

THE BIGGEST BARGAIN EVER OFFERED.

A $20 BREECH-LOADING GUN FOR $7.00.

NEW, PERFECT, FRESH FROM THE FACTORY AND GUARANTEED IN EVERY RESPECT. EVERY ONE THOROUGHLY TESTED AT FACTORY BEFORE EXPORTATION.

Owing to the failure of the LONDON & LIVERPOOL FIRE ARMS CO., of London, England, we have secured a consignment of their celebrated Breech-loading Shot Guns **THE CHAMPION,** at thirty-three and one-third cents on the dollar of the actual cost of manufacture. One hundred thousand stand of these Guns have been thrown on the European and American market, only a small portion of which have come to America. These we have secured entire control of and offer them for the purpose of introduction at less than cost of manufacture until **JULY 15th, 1881,** when the price will be advanced to the regular rate **$20.00 each.** This Shot Gun fills the long-felt want for a **reliable Breech-loading Shot Gun at a reasonable price.** The country has been flooded with cheap, worthless American fire-arms, made of inferior material miserably put together, and as far as reliability or accuracy are concerned perfectly useless. **THE CHAMPION** is new and perfect, finely finished, case-hardened and blued, made of very best materials, and by the Improved Attachments, as shown in cuts Nos. 1 & 2, are rendered superior to any other English or American Shot Gun. They are too well-known to need extensive description, when we state that they are perfect, and warranted **Genuine CHAMPIONS,** that is sufficient. Every Man or Boy in this country who needs a Shot Gun should purchase one of **THE CHAMPIONS,** as they are the biggest Bargain ever offered in America, and will never be offered again. We **GUARANTEE** these Shot Guns to be in every respect as represented or Money will be refunded. You cannot let this opportunity slip if you want a Shot Gun, and as a chance for speculation it is well worth your attention. You can at any time sell the Shot Gun for a great deal more than you gave for it. **THE CHAMPION** is a great favorite with Sportsmen on account of the rapidity and ease with which it can be loaded, and its superior Shooting qualities. That it stands unrivaled, as a first-class Fire-arm, is shown by the thousands of English testimonials on file. The editor of THE ATLAS (N. Y.) says: *"They are the most extraordinary bargains I ever saw. They shoot equal to my $90 Scott Gun."* He has bought two. R. E. Reed, Secretary of the New York Ducking Club, says: *"Your CHAMPION IMPORTED BREECH-LOADING SHOT GUN is an unheard-of Bargain and worth at least $20.00. Our Club will have several. Heartily endorse your assertions: this Shot Gun will more than satisfy every purchaser."* **ORDER AT ONCE** as our consignment is only **ONE THOUSAND** and our limit is **JULY 15th, 1881.**

TAKE NOTICE—We will send (until July 15th, 1881,) **ONE CHAMPION IMPORTED BREECH-LOADING SHOT GUN** as described above, carefully boxed, for $7.00, and when Cash accompanies the Order will give Free one of our new Sportsman's Cartridge Belts, as shown in cut, also 50 Metallic Reloadable Shells (*last a life-time*).

Send Money by REGISTERED LETTER or POST-OFFICE ORDER at our Risk. Or we will send the Gun **C.O.D.** with privilege of Examination upon receipt of $2.00 to cover express charges, or your express agent's guaranty that the Gun will be returned free of all expense to us if not taken by you, but we do not send the Sportsman's Belt or Reloading Shells if sent C.O.D., as this extra inducement is to those who send **CASH WITH ORDER.** Should you have no acquaintance with our Firm, and desire a reference as to our reliability, we would refer you to any Mercantile Agency, Express Company, Bank or Newspaper Publisher in this City. **ORDER NOW,** even if you have no use for a Gun for six months; you never will get another such Bargain. Address **E. G. RIDEOUT & CO.,** 10 Barclay Street, New York.

SPECIAL OFFER.—If you will get a Club of Five and send us $35.00 we will send YOU one Gun free for your trouble.

BOLSTER SPRINGS FOR FARM WAGONS.

Made of Best Oil Tempered Steel

SOMETHING NEW!

They save largely from wear and tear in every part of the Wagon. They remove all necessity for a Spring Seat. They convert a common Lumber Wagon into a Spring Wagon, making it equally comfortable for from one to twenty persons. They are admirably adapted to the wants of Fruit and Vegetable Growers. They are suited to all makes and sizes of Farm Wagons, and can be attached by any one. They make the cheapest and easiest riding Spring Wagon in the market. These Springs have been in practical use for over three years, and are a pronounced success. No Teamster or Farmer can afford to be without them.

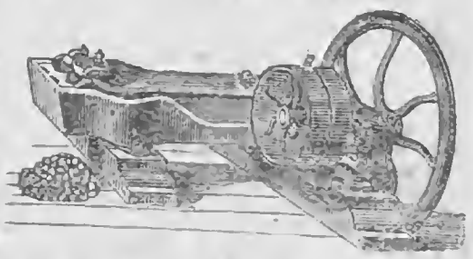
CHEAPEST AND BEST FERTILIZER---FOLLOW NATURE.



Which USES GROUND RAW LIMESTONE in MAKING THE SOIL. There were no Lime Kilns around burning lime when the good **Limestone Farming lands** were originally made. Every Farmer can prepare his own Fertilizer with an **ordinary Horse Power** by using **FORSTER'S COMBINED CRUSHER & PULVERIZER,** which takes a lump of Limestone three to five inches square, and Crushes and Pulverizes it in **one operation,** same as Burr's. Farmers use the Ground Raw Limestone, and drill and sow it just as it comes from the machine. W. W. Reed, of Erie, has tried it 6 years, and says it shows a profit over Bone Dust of $4.96 per acre; over Phosphate of $4.28 per acre; over Guano of $9.70 per acre; over Salt of $5.90 per acre, **and that it will last twice as long."**—John G. Barr, of Montgomery, Lycoming Co., says: "I believe it to be the cheapest and best Fertilizer in this country. *It is worth three times as much as Burnt Lime, and with this machine does not cost half a much as Burnt Lime to make."*—H. C. Falls, New Castle, Pa., says: "I used the Ground Limestone last year with great satisfaction as to results, and cannot too strongly recommend it for farm and garden purposes Where I dropped my corn on top of it, the corn came up first, and was strong and thrifty—the Limestone drawing the moisture to the roots. Used in place of Paris green on Potatoes, it kept the Bugs away and made the plants thrifty and strong; being washed into the ground, it benefited the Potatoes in an astonishing manner. Address only **TOTTEN & CO., Pittsburgh, Pa.** ONLY MAKERS.

Travelers' Testimony.

Thousands of Travelers by land and sea have vouched for the efficacy of Hostetter's Stomach Bitters as a preventive of the physical disturbances which ordinarily arise from change of climate and the changes of diet, water, &c., incident to a wandering life. Upon systems toned, invigorated and regulated by this genial vegetable antidote the external causes of debility and disease seem to produce little or no effect. Forearmed with Hostetter's Bitters the voyager may bid defiance to sea-sickness and encounter the chilling fogs of the British Isles, the coast winds of the Antilles, the icy temperature of Northern Alaska, or the burning heat of the tropics with equal impunity. The effect of this admirable medicated stimulant is greatly to increase the vital energy of the system, thereby enabling it to resist and repel the exciting causes of disease.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XL.—No. 1635.} NEW YORK, MAY 28, 1881. {PRICE FIVE CENTS $2,00 PER YEAR.

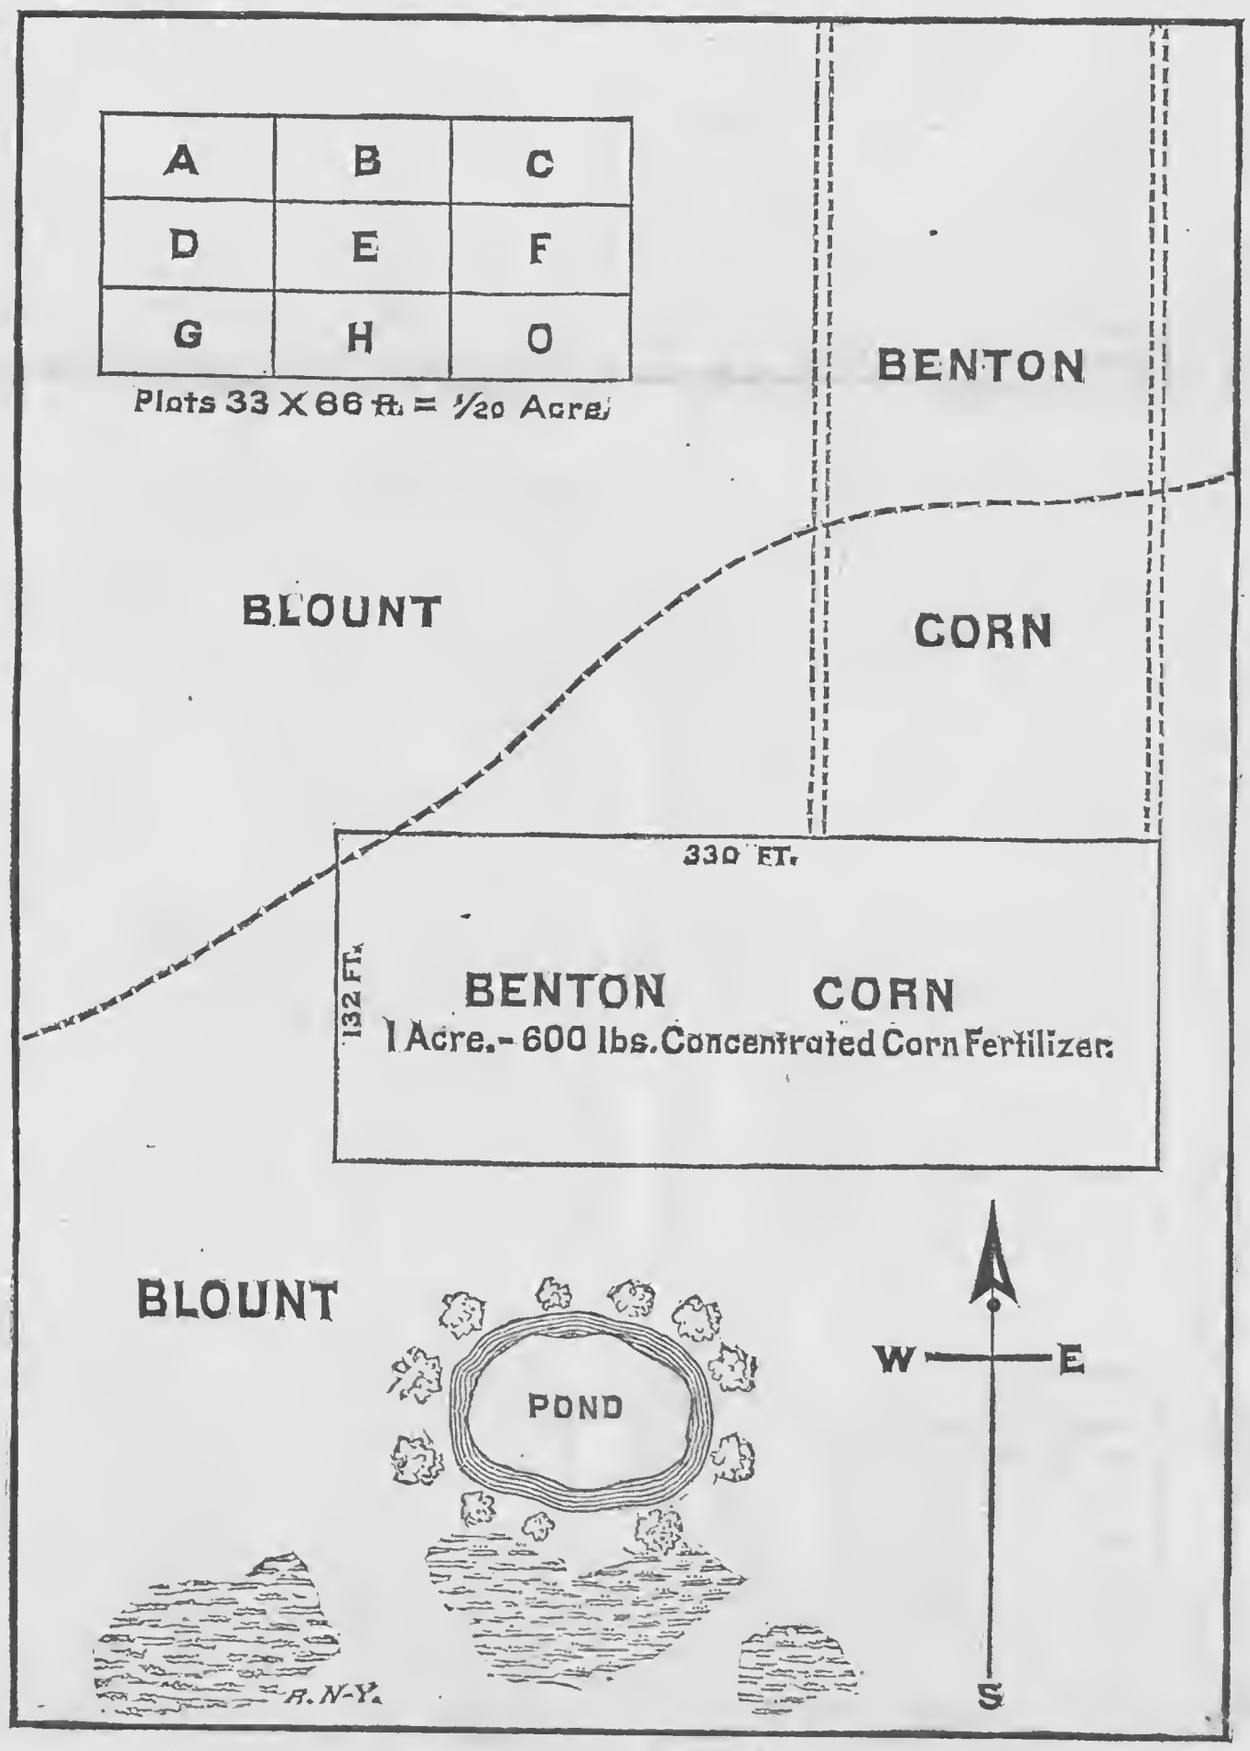
[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Field Crops.

NOTES FROM THE RURAL FARM.

Corn Experiments.

IT is very desirable that all of our farmer readers should familiarize themselves with the experiments we are making in connection with the cultivation of corn the present season and with the field itself in so far as this is possible. We have, therefore prepared a diagram which will serve to place the matter clearly before them. This field of about six acres—we have not yet measured it—has been, as already stated, in grass and pasture for six years. The sod which was thin and worn out was turned late in March. April 24 to 27 inclusive it was harrowed three times; then rolled and again harrowed, no manure or fertilizer of any kind having been spread upon it. An acre, as shown, 132x330 feet, was then measured off and 600 pounds of "corn manure," extended with about the same bulk of earth, thoroughly mixed, were sown upon this acre which was at once harrowed again. The entire field was marked off North and South, the marks precisely three feet ten inches apart. Upon the measured acre we drilled in four quarts and a pint (kernels one foot apart) of what we shall call BENTON Corn. This same corn was also drilled in upon little less than an acre upon the land between the double-dotted lines connecting with the acre to the South, so that we should have the required data for comparison between the product of the manured acre and that of the natural soil. The plots A, B, C, D, E, F, G H and O are each 66 feet long by 33 feet wide, or one-twentieth of an acre. The A-plot is manured with seven and a-half pounds of nitrate of soda, furnishing, according to analysis, 1½ pound of nitrogen. B-plot is manured with 17½ pounds of superphosphate supposed to furnish 2⅝ pounds of phosphoric acid; the C-plot with 7½ pounds of muriate of potash furnishing three pounds and three-quarters of actual potash. The D-plot combines the nitrate of soda and superphosphate; E-plot the nitrate of soda and muriate of potash; F-plot the superphosphate and muriate of potash; G-plot nitrate of soda, superphosphate and muriate of potash; H-plot 20 pounds plaster (sulphate of lime) only; O-plot no manure. In the present experiment the "no-manure" plot is really not needed, since, with the exception of the one acre noted, no other portion of the field is manured. It will be seen that the "G" manure is what has been termed a "complete manure" for the reason that it is supposed to furnish the essential plant-food which it is presumed does not exist in soils that have been cultivated for many years in sufficient quantities, viz., nitrogen, phosphoric acid and potash. It may be, however, that a given soil is already well supplied with one or two of these ingredients, as, for example, potash and phosphoric acid. In such a case it is plain the A-manure which furnishes nitrogen should produce as large a crop as the G-manure which furnishes all three. So, again, perhaps the soil is well supplied with nitrogen and potash. In such a case it is reasonable to suppose that nitrogenous and potassic manures would add nothing to the crop, but that phosphatic manures (as the B-manure) would produce a marked effect. Thus on the one hand it is the design of this experiment to determine whether our soil needs one, any two or all three of the chief ingredients furnished by farm manures and imitated as nearly as may be by concentrated commercial fertilizers, or, on the other, to ascertain if the use of these fertilizers pays in *any* form. In the case of the acre experiment, 600 pounds of commercial fertilizer have been used, costing about $15.00. This so-called "corn fertilizer" is prepared by the manufacturers to supply not only all the food which corn requires, but also, in a measure, in the needed relative quantities of each chief ingredient as determined by chemical analyses. Let us see: As the acre is a fair average of the entire field as to fertility, etc., unless we should produce upon it at least 20 bushels more than the average crop per acre of the rest of the field, we shall have, in so far as this one test is concerned, no reason to believe that the "corn fertilizer" has paid for itself.



CORN AND FERTILIZER EXPERIMENT FIELD AT THE RURAL FARM.—Fig. 265.

Again referring to the diagram, it may be said as an aid to the interested reader in forming correct conclusions when our crop report shall appear, that to the north of the curving dotted line running east and west is rolling land and a very gravelly soil. Many stones are from three to four inches in diameter. From that line to the pond it is less gravelly and more sandy. From the pond to the southern boundary the soil is the same, a sandy loam, but there are three places, together about half an acre in extent, that are not well drained. These are indicated by the three clusters of shading.

As above stated, nearly two acres are planted to what we have called Benton Corn, the finest white dent we have ever seen. The rest of the field is planted to Blount's White Prolific with seed which we have with the utmost care selected for three years.

Upon the field which last year gave us the great yield of Blount's Corn, we have this year planted the Chester County Mammoth, using 400 pounds of "corn fertilizer" from another manufacturer. Adjoining is another acre (or thereabouts—we have not yet measured it) without manure.

In odd corners of the farm, selected with a view to prevent intercrossing as far as possible, we have planted little plots of different kinds of corn which with high commendation have been sent to us for trial by kind friends.

Acquaintances hereabout with whom we have talked, are free to express the belief that our corn crop from the unmanured land will be light, and the impoverished appearance of the field for several years past justifies this belief. But there is nothing surprising or instructive in the matter of obtaining fine yields from superb land. If we *should* get a fine yield from *this* land, it would be both surprising and instructive, as it would demonstrate—but perhaps we had better wait until the fine crop is secured before we tax our good readers with a statement of what "it would demonstrate."

CLOVER AND TAME GRASSES IN THE SOUTHWEST.

IT is pretty generally conceded now by the best informed that the cultivated grasses can be successfully grown at the Southwest, although I think the masses do not yet believe it. Even those who own that they can, make the concession with a good deal of qualification, as though raising grass were not profitable and easy, and as if it could be successful only in a limited way, and with great management, and in exceptional areas. For about seven years or more I have made the adaptation of Mississippi (more particularly) to the grasses a special study. I have not only sent out letters of inquiry by the hundred, but numberless times have ridden hundreds of miles merely to see a demonstration. In this and some future articles I shall give to the readers of the RURAL the results of my experience and investigation with regard to clover and the tame grasses, particularly in Eastern Mississippi and Western Alabama.

Red Clover—Trifolium pratense.

This will succeed almost anywhere in Mississippi and Alabama. I have sowed it in Southern Mississippi in sandy soil, and have seen it growing luxuriantly on tracks of railroads in sand taken from 30 feet below the surface. While clover here is not a Summer pasture in the sense that it is North and East, it furnishes a food supply a longer time, by keeping green more months in the year. It begins to give considerable food in late October and will grow much, if not all, the time in an average Winter, suffering a check and killing in cold spells, but furnishing abundant subsistence underneath the general mass. It grows steadily in almost any Winter after the middle of February, and holds on until well in June or July, when it dies down generally, to come on again in October. I do not think its uselessness from hot weather can last over six weeks to two months more than at the East, while it can certainly be said to be in good season at least eight months in the year. It certainly cannot be said to do as well at the North.

By seeding clover upon Bermuda sod a perpetual pasture may be had, thus not only affording a fine "foot" for stock in our open Winters (particularly serviceable in stiff prairie soils), but giving a change for stock during a good part of Spring and Summer. Bermuda Grass will furnish fine grazing from mid April until mid-October, thus supplementing clover completely. Of the value of Bermuda Grass as a Summer pasture it ought to be superfluous to speak, standing, as it does, the hottest suns and driest weather, and surpassing al-

most all grasses in nutritive properties. It is almost ineradicable, and many suppose it will extirpate clover. This is a great mistake. I have seen pastures where both have been flourishing for over 30 years and both were in unimpaired vigor. I have no doubt that they will coexist until the end of time on the same sod. I know of well-authenticated instances where clover has lived over 40 years without having been re-seeded. I think it will bear three crops of seed in a year; certainly two. The first is considerable, and this explains the presence of much young and tender clover when the crop which bore the seed has become tough and woody. This not only insures a perpetual stand, but a greater fertilization of soil, as well as a fresh pasture. It is doubtless the explanation of the fact that clover, under good treatment, never requires re-seeding.

I might give illustrations without number of how long clover will "run" without re-seeding, even where cultivated crops have been raised for several years in succession. I will only mention two, where crops of corn or cotton were raised, in the one case for seven consecutive years and in the other for nine, on a clover sod, and then a good stand was obtained without re-seeding. I give an instance of this sort. Clover was seeded with oats. In June the oats were cut and the stubble pastured. In the Fall the ground was again sowed to oats, which were again cut and the stubble again pastured This plan was followed for 11 years consecutively. The clover was never re-seeded. At the end of that time the stand of clover was unimpaired. It is amazing how well clover will succeed in an indifferently-prepared soil. Nothing is more common here than to sow it on the ground where corn has been planted. It yields all that could be desired in most cases, particularly when sown in October. It is considered a great chance to have a good Bermuda sod upon which to seed it. It is sown on the ground, with no preparation of soil and no work after seeding. I have been sowing some 80 acres of Bermuda sod, part of the sod being 30 years or more old. I did not begin until the middle of February and I have not finished yet. I expect to fence part of it and cut at least four tons per acre in the two mowings I shall get this Summer and next Fall, and, maybe, three. On the remainder I shall soon turn stock and graze it unremittingly, and the work is done for all time. I never expect to have to re-seed it. It is quite common to sow clover in Spring and turn stock on it at once, and never take them off.

I have known clover sown in the Fall to be cut twice the next Summer, the mowings being only six weeks apart. As high as 9 000 pounds of hay per acre have been cut at one mowing. If any one doubts this, let him ask Dr. D. B. Phares, Professor of Botany at the Agricultural and Mechanical College, Starkville, Miss., who has done it, and he admits that he has been surpassed. It grows very commonly four feet high in good soil, and I have known it in one instance nearly six feet. Of course, it does not stand up when so high. Two crops of hay may almost always be counted on; occasionally three. It ought to be sown in October, as it then gets the best of the weeds, which often interfere if it is sown in the Spring. Many, however, sow it in February; but this is risky, as a freeze sometimes kills the young plant. An October seeding I have never known to fail. More seed seems to be required here than at the North. It may be owing to the fact that we lose some by our indifferent preparation of the soil. A bushel to six acres is little enough, as it is generally sown.

The prairie soil of East Mississippi and West Alabama is particularly fine. I have never seen any equal to it. It is a deep, black, rich soil, very close and limy. The rain-fall doubtless contributes greatly to the wonderful success of the grasses, as there are about 60 inches of rain-fall per annum, and it is distributed throughout the year. In some of the Summer months there are from seven to nine inches of rain-fall.

Clover hay will sell at from $15 to $20 per ton, and one gentleman in the prairies of East Mississippi is preparing to bale it.

Mobile Co., Ala. M. B. HILLYARD.

Propagating Choice Potatoes.

Years ago when the Early Rose Potatoes were first sent out, a neighbor who had raised them the year before, brought me seven quite small tubers to start with. In his presence I cut each eye out, leaving with each a fair proportion of the potato. Then I cut each eye through the center in one, two, three and four different directions, according to size, so as to make of each eye two, four, six and eight different pieces, each shaped like a pyramid and having a skin surface of about one-fourth of an inch. These I planted about a foot apart in good soil and harvested two bushels of potatoes, with a good proportion of large ones, after cooking a mess or two to try them. Each piece of the eyes grew. While preparing the seed my neighbor remarked, "I would plant *one* at least in the usual way, as none of these will grow," hinting, I suppose, that no future generosity would be wasted on a fellow who slashed into such costly potatoes in that way. I have since let him have seed potatoes from the product of that donation. A. C. S.

THE WINTER WHEAT CROP OF ILLINOIS, according to reports made to the State Department of Agriculture down to May 2, promises 69 per cent. of an average crop in the Northern Division of 23 counties; 62 per cent. of an average crop in the Central Division of 38 counties, and 77 per cent. of an average crop in the Southern Division of 41 counties. This condition, although discouraging, is not so bad as predicted by several Western papers, and the large acreage sowed to Spring wheat will doubtless, partially at least, make up for the Winter wheat area that has been plowed up, and the poor condition of some of the growing Winter wheat.

Farm Economy.

WORTHLESS COMPOUNDS OF NITROGEN IN SOME COMMERCIAL FERTILIZERS.

PROFESSOR F. H. STORER.

THE precept can hardly be too often enforced that in buying mixtures of commercial fertilizers the farmer must be on his guard lest inferior or even worthless kinds of nitrogen compounds be imposed upon him as if they were the best. It is an easy matter, for example, to dose many of the mixtures known as "ammoniated superphosphates" in such a manner that, while they show a high percentage of nitrogen on chemical analysis, they may really be worth nothing whatever as nitrogenized manures, because the nitrogen contained in them and exhibited by analysis may be in such forms that it is inert, undecomposable in the soil, and practically worthless as a plant-food. To take an extreme instance, coal-dust contains more or less nitrogen, and so do peat and bog-mud, and it would be practicable to incorporate a certain proportion of these materials with any dark-colored superphosphate; though the risk of fraud from the use of these particular substances cannot be great since the proportion of nitrogen contained in them is, comparatively speaking, small. But with leather the case is different. Here is a substance containing five or six per cent of nitrogen, or sometimes even more, which, when properly incorporated with a superphosphate, might appreciably increase the proportion of nitrogen to be indicated by analysis without adding anything to the fertilizing power of the material.

Chemists have often called attention to the possibility of this particular kind of fraud, but the general feeling seems to have been that a supposed difficulty in reducing the leather to powder would greatly hinder, or even wholly prevent, its being used in this way. There is, however, no great difficulty in reducing leather to powder. As every one knows who has happened to leave his boots too near the fire, leather quickly becomes brittle and friable when it is heated somewhat strongly, and after having been thus superheated, or almost charred, it admits of being ground to meal. Moreover, there is already in the market, and to be had at an extremely low price, a kind of leather-scrap which is dry and brittle enough, as it stands, to be ground to powder without need of any preliminary heating. This product is a residue obtained by certain manufacturers who make a business of extracting from ordinary leather scraps the oil and grease which have been put into the leather in the processes of currying and blacking it. To recover this grease the scraps are boiled and steamed at a heat high enough to melt the fatty matters, and they are then subjected to pressure powerful enough to squeeze out both the water and the melted grease. There is good reason to believe that the dark, friable residue which comes from the presses is sometimes used in the manufacture of commercial fertilizers. It is evident that it might readily be used to this end, particularly in the process of manufacture employed at some works, where fish scrap, acid and phosphates are churned together, and it would probably be no easy matter to detect the adulteration of fertilizers prepared in this particular way. Since the pressed leather scrap above described may be bought at rather less than a sixth of the price it could readily be sold for in the form of superphosphates, there is all the more reason for the buyer of fertilizers to be on his guard against it. The chemists who are chiefly occupied with the analysis of fertilizers will do well meanwhile in trying to devise some means of detecting this particular form of adulteration.

The real lesson taught by the risk of adulterations such as the foregoing, seems plain enough; namely, that the farmer had in general much better buy *separately* each particular kind of fertilizer which he may happen to need. He will commonly do well to avoid all mixed preparations. If any one wishes to use a superphosphate, for example, let him buy that material by itself, in the form of "plain" superphosphate of lime; and if he wishes to use fish-scrap or oil-cake in conjunction with the superphosphate, let these things be bought as such, so that he may know just what he is doing. The risk of adulteration would in this way be greatly diminished, inasmuch as there would be much less profit and considerably more difficulty in trying to conceal the leather-scrap in either of these materials than in ammoniated superphosphate or other mixed fertilizer of high price and no characteristic appearance. As a rule, materials thus bought separately should cost less than those upon which the manufacturer has spent time and labor in the processes of mixing. They may be spread upon the land one after the other or mixed immediately before use, if mixing be deemed advisable. The shoveling together of harmless powder is neither a complex nor a difficult operation. It is quite within the powers of even the stupidest laborer.

FOUL SEEDS IN WHEAT BRAN.—I recently bought some Western wheat bran which was literally full of foul seeds, evidently the screenings of the wheat. In a single ounce, taken at random from the stock, I counted 97 seeds besides many broken ones. A portion of the excrements of the animals to which the bran was fed, was washed, and hundreds of the seeds were found to be apparently wholly unimpaired in vitality. The increase of weeds of new and old varieties has caused in this section much distrust of grass, clover and other seeds; but this experience suggests that the mischief is due largely to the culpable practice of the millers of putting the screenings into the bran. If they must utilize the weed seeds, they should be compelled to grind them before putting them into the feed.

Georgia, Vt., O. S. ELLIS.

The Herdsman.

NOTES BY A STOCKMAN.

THE Alphea Jerseys bid fair to rival the history of the Duchess family of Short-horns. By judicious puffing through the papers, and by extraordinary claims for heretofore unheard of butter production, this strain has become notorious. And the effect of this notoriety is to put money in the purses of speculators in this strain of Jersey stock. The owner of an Alphea bull or heifer may count his thousands as good as in his purse. Never before, perhaps, has so much money been paid on the strength of the mere unsupported statement of a hired man whose interest is to please his employer, as in these purchases. There is perhaps nothing objectionable in it all; the money is as well on the "Wing" as in the pocket, and whether Alma Farm pays it and Maple-shade takes it, all is one to the speculator who never had a thousand dollars to invest in an Alphea calf. Truly, this is a revival of the worship of the golden calf when a little year-old brings $900 and another $1 258 50, precisely to a cent. How accurately must her value have been gauged to figure so close as to 50 cents!

So long as this speculation is confined to wealthy persons, no harm is done. It amuses them and hurts nobody. But no farmer or dairyman should be tempted to take a hand in this business, because it will not pay him, even should every claim made for these animals be justified by the actual facts.

BUT——there is always a "but"—did Eurotas ever make 778 pounds and one ounce of butter (again a circumstantial and particular account to a dot), within 365 days and between two calves. I venture to say that this question will be always as uncertain as that regarding the person who struck William Patterson.

JUST now there is a dispute going on as to whether sheep or cattle are the most profitable for a farmer to keep. In discussing such a question as this, the advocates on each side only seek to support their own views, and no one should be misled by the figures they show. One man says he made $54 on 10 sheep in one year. I have done better than that on five times as many. But to infer that if 10 sheep pay $54 in one year, a thousand will pay $5 400, would be very unsafe. A small flock is proportionately more profitable than a large one, no doubt, but no flock ever paid more than 50 per cent clear profit on its cost, in a year, except under specially favorable circumstances. But that should satisfy any reasonable man. I think it is safe to believe that a man who understands well the management of sheep and devotes his attention to a flock, can realize a profit of 50 per cent. on his investment, not counting the interest on the cost of his land unless it is very cheap indeed. No man can keep sheep exclusively for wool and mutton alone on land costing $100 an acre. He may make a profit on the sheep, charging them no rent of land; and that will be fair because the sheep are a sort of "saving bag" into which odds and ends that would be wasted are gathered.

WHERE a person designs to devote himself to sheep-keeping alone, he must go West where the range is practically free and where a homestead for winter occupation and to be cultivated for winter feeding can be procured for $10 an acre. A homestead of 160 acres would sustain 2,000 sheep upon corn, millet and other feeding crops with rye sown among the corn for Winter pasture, and with a free range in the Summer. And a flock thus kept should pay one dollar a head clear profit; or, if the wool is made to pay all expenses, the increase, which should be 75 per cent., would be equal to a profit of more than 50 per cent. on the value of the flock.

No herd of cattle kept entirely for increase ever did or ever can do this; simply because it requires too much labor in the management, in proportion to the capital and the income, and it does not pay two dividends as a flock does, viz., a fleece and a lamb every year. Even where cattle are grazed without any cost for land, as in some localities on the great plains, there are many deductions to be made for losses and expenses, which greatly reduce the profits. The dairy is, after all, the most profitable branch of cattle keeping. One needs no figures to show it. He can do better; he can show land constantly improving in character; a herd constantly increasing in number and value; a farmer always with money in his pocket, and the lightest labor of all farm work.

Some Eastern New Jersey farmers may "point with pride" to their success with fat pigs. They show every year how it pays to manufacture raw products into finished articles when it is well done. A pound of cotton worth 15 cents is made into cloth worth 50 cents A pound of iron worth a cent is made into nails worth five cents; and into steel watch springs worth hundreds of dollars. A bushel of corn worth 50 cents is made into pork worth 80 cents by these New Jerseymen, not to count a quantity of valuable manure left. The following are the particulars concerning these Jersey pigs:

Mr. Southard's 29 pigs ranged from 657 to 855 pounds.
Mr. Harrison's 20 pigs averaged 767 pounds.
Mr. Carter's 20 pigs averaged 766¾ pounds.

Mr. Harrison fed his pigs and 30 head of cattle on 50 acres of corn and had 1 000 bushels left in the crib. At 50 cents a bushel the corn would have been worth $1 600. His pigs alone brought this sum and the feeding of 30 cattle and the 1 000 bushels in the crib were the profit. For several years past there has been a vigorous contest in Burlington County, N. J., to raise the heaviest pigs, and this is a sample of the result. It is worth making a note of.

"Nothing succeeds like success." When a man makes a conspicuous success like this his neighbors begin to strive to beat him. Perhaps one succeeds, and this gives piquancy and interest to the struggle, which is continued from year to year; first one takes the lead and then the other, and so the contestants persevere and persist, and perseverance and persistence in keeping any kind of live stock are indispensable to success. Those succeed who stick to their chosen business; those fail who are ever changing. "Unstable as water they cannot excel." And I would just here emphasize this note, that if a man desires to have a profitable flock or herd, he must make it his life's business to cultivate it. Choose well; and choose for better or worse; but stick to it and it will always be better and never worse.

Large Sale of Jerseys.

During the past week a large auction sale of Jersey cattle took place in this city. On Tuesday, May 17, 64 head were sold for the aggregate sum of $18 505—an average of $289 14. The following is a list of the highest-priced animals sold, with the names of buyers and prices:—

Leda, 799, cow, 12 years; William Simpson, New York and New Hudson	$3,000 00
Queen of the Farm, 9,069, cow, 6 years; John I. Holly, Plainfield, N. J.	1,300 00
Malita, 5,169, cow, 3 years, and heifer calf; T. A. Havemeyer, New York	1,300 00
Daisy Maid of Bloomfield, 8,352, cow, 3 years; T. A. Havemeyer, New York	1,200 00
Hohokus, 5 569, bull, 1 year; P. S. Gobel	1,000 00
Phrynette, 9,089, heifer, 2 years; P. S. Gobel	675 00
Pierott's Rosebud, cow, 4 years; Edwin Dana	660 00

Leda, sold for Mr. A. B Darling, is a pure Alphea cow, and brought the highest price ever paid for a Jersey cow, though her son, Polonius, was sold for $4 500 on the 5th inst. She is now in calf by Duke of Darlington, son of the famous butter cow Eurotas. Her purchaser, Mr. W. Simpson, now owns all the pure Alphea cows. Queen of the Farm is an imported cow.

The sale was concluded on Wednesday, when 64 animals were sold for $18 717 50, which gave an average of $292 46. The following is a list of the highest-priced animals sold, with the names of the buyers and prices:—

Satin, 10,329, heifer, 3 years; T. A. Havemeyer.	$2,050 00
Petronella, 8,819, heifer, 2 years; Moulton Bros.	2,050 00
Favorite's May, 8,662, heifer, 2 years; T. A. Havemeyer	1,625 00

Pyrrha 2nd, 9,561, heifer, 2 years; Moulton Bros.	850 00
Bonnie Grisette, 6,979, cow, 4 years; T. A. Havemeyer	800 00
Heifer calf 20 days old; W. R. McCreary	730 00
Nonesuch of Jersey, 9,982, cow, 5 years; Paul Dana	500 00

Satin and Petronella are of Alphea blood, and with Leda, sold the day before, form the highest-priced trio of Jerseys ever sold At the close of the sale the Breeders' Cup, donated by several members of the Cattle Club for the best average price of not less than five head belonging to one owner in the sale, was awarded to Mr. John I. Holly, of Plainfield, N. J., who sold 6½ head (cow and calf counting as 1½) for an average of $1 085 39, while Mr. A. B. Darling pushed him so closely on an equal number as to average $1,085, leaving Mr. Holly a lead of only 39 cents per head. The best price obtained by Mr. Holly was $2,050 on the heifer Petronella, by Polonius, in calf by Uproar, and as Mr. Darling bred the last-named animals and sold them to Mr. Holly, he won in reputation as a breeder by his rival's success.

Dairy Husbandry.

OBSTRUCTIONS IN COWS' TEATS.

H. C. B., Lanesborough Pa., has a cow that dried up three-tenths; then gave a full yield of milk which came from every teat; but now three of her teats give only about half a pint at each milking while the other one gives four or five quarts, and our correspondent asks the cause of this condition and a remedy therefor.

ANSWER BY PROFESSOR L. B. ARNOLD.

The cause of stoppage in the flow of milk in cases like the one described by H. C. B., lies in the closing of a small aperture located at the junction of the teat with the udder, through which all the milk must pass to enter the teat. A little explanation will make the situation clear. The interior of the bovine udder is not, as some suppose, a single sack for holding milk. While milk is being secreted it is held in small reservoirs distributed through the entire substance of the udder, varying in size from a pin head to a pea, and in some very large milkers, to the size of a cherry. These little reservoirs are all connected by small tubes leading from one to another, and finally to a central cavity located immediately over the teat. There are but two cavities of any considerable size in each quarter of the bag. One of these is the cavity in the teat and the other is the central one above it just referred to. The two are separated only by a thin partition of tissue covered with the mucous membrane lining the two cavities and forming a sort of diaphragm with a hole in its center, about the size of a small pea, for admitting milk into the teat. The relative size and position of these two cavities and the separation between them will be seen by reference to Figure 266. The cavity above the teat, like the one within it, varies considerably in different cows, running from the size of an egg to the capacity of a pint or more.

Where the membrane doubles over to form the edge of the hole, it incloses a small tendon made up of very fine, elastic fibers, forming a ring, which has a connection with muscles upon the abdomen under the control of the cow's will by the contraction or relaxation of which she closes or opens the aperture at pleasure, so long as the tendon remains in a healthy condition. But this little delicate cord gets out of order quite easily. By the influence of continued inflammation it often contracts and becomes rigid, closing up the aperture for admitting milk into the teat and thus giving rise to the difficulty described by H. C. B. When once contracted there is no let-up to its rigidity. It remains permanently contracted, unless per chance, it may yield a trifle while under the influence of some strong laxative. The contraction makes a hard bunch, apparently about the size of a buck shot or a little larger, which may be felt by pressing the teat at its connection with the udder.

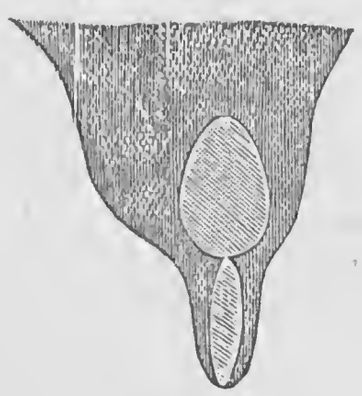


FIG. 266.

The remedy for this misfortune consists in forcing open the closed passage. This may be done in several ways, two of which will be described. The first is to crowd into the passage a smooth plug of metal, ivory, bone, or hard wood, as shown in Figure 267. Whatever the material, it should be well oiled to prevent injury by needless friction, and should have an enlargement near the lower end to prevent it from dropping out of the teat while it is carried by the cow between milkings. The orifice by being continually strained will soon adapt itself to the size of the instrument. A small plug may be used at first and a larger one afterward. One advantage of this method is, it can be executed by any skillful dairyman when once he sees what is required to be done.

The remedy which has proved the most successful and satisfactory consists in cutting open the obstruction with an instrument invented by Wm. Horne of Janesville, Wis., the structure and full size of which are shown in Figure 268. It is a metallic concave, half-round, and looks like a little cheese trier or a a butter trier in miniature. The end inserted is made sharp so it will cut upon a little pressure. It is used by entering the teat the same as shown in Figure 267 but instead of *crowding* its way through the obstruction, it *cuts* its way through with a half-round cut, a form which does not close up so readily as a strait

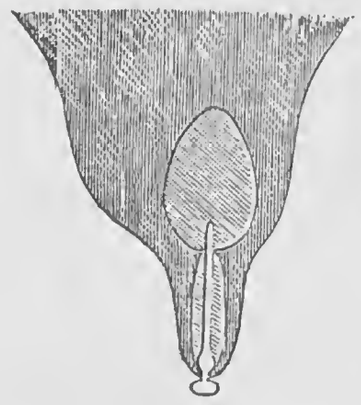

FIG. 267.

incision. By noticing the illustrations it will readily be seen that if used when the cavity above the teat is filled with milk, there can be no danger of injury to the udder as the instrument will only extend into the milk without touching the walls of the cavity. This rarely fails to be effectual. If the cut is inclined to grow up, it may be kept open by using the plug as in Figure 267, till it begins to heal. Any farmer with ordinary tact can use it without the aid of a veterinarian. But prevention is better than cure. The obstruction can be avoided by avoiding the causes which produce it. One of these is high feeding with heat-producing food, such as corn meal, before the cows come in. The bag in such cases becomes unduly swelled and hardened, and severe and long continued inflammation follows with a tendency to contracting and closing the orifice as described. Heifers are apt to suffer more than old cows from this cause.

Another cause is too much pulling and jerking down upon the teats in milking. The teat is so intimately connected with the parts which surround the passage liable to be closed, that violence to the teat affects them. The jerking method of milking is always objectionable at any time, but it is especially so when there is any inflammation about the udder.

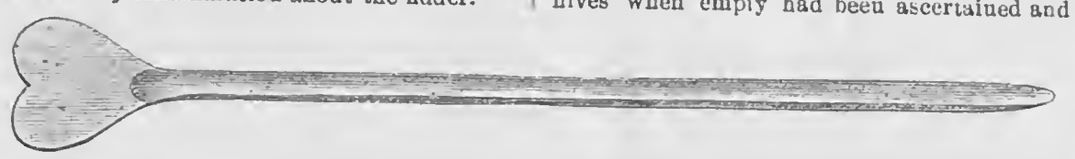

FIG. 268.

The most common cause of stoppage arises from a want of proper care and skill when cows are being dried off. Milk is apt to be left too long in the bag. It fills into the cavity over the teats where it lies till it curdles. The serum or whey separates and is soon absorbed away, but the curd becomes hard and remains till it becomes a serious source of irritation and inflammation in the parts upon which it rests, and hence is all the time tending to induce contraction in the very parts where the stoppage occurs. Cows which are hard to dry off have the most sensitive udders, and the greater crowd of milk makes them much the most liable to injury. The strictest attention in drying them should always be observed.

By watchful care in guarding against the various causes of obstruction and giving prompt attention when a case occurs, in applying the remedies pointed out, many of the the good cows which go to the shambles every year from having obstructed teats, may be saved for a better fate.

The Apiarian.

THE TRUE THEORY OF BEE CULTURE.

WHILE scientific men of all ages and countries have puzzled their brains to discover the principles that govern the growth of vegetation, in order to improve the arts and science of husbandry, apiarian science, the most interesting and profitable of all rural pursuits, has been comparatively neglected. Though a few important improvements and advantages have been secured by a better adaptation and arrangement of the habitations to the natural habits, wants and instincts of the insect, the true theory of bee culture is correctly understood by only a few. He who would succeed in directing and shaping the action of a colony of bees so as to secure the greatest amount of profit, and proceed with a certainty of success, must study and apply that system of principles which constitutes the foundation on which bee culture rests.

In the application of these principles he should possess sufficient tact and judgment to enable him to vary their application so as to reach the exigencies of each particular case. Has this degree of proficiency yet been attained by any of our bee-keepers in this stage of progressive bee culture? I believe it has, and with it the dawning of a day when thousands of toiling men will teach their children to bless and honor the names of those instrumental in hastening the good time coming.

I believe that by the unremitting toil and study of years by some of our scientific bee-keepers, a theory has been discovered and applied that will satisfactorily account for the large returns that have been secured of late years by Doolittle, Captain Hetherington and other "great lights" in the business. The practice of bee culture, in accordance with the principles involved in this theory, if persevered in, cannot but be productive of results in the highest degree satisfactory. It is a fact well known to bee keepers, that at times and under certain conditions colonies of bees, in the accumulation of stores and in the general economy of the hive, will so far exceed the general average of colonies equally strong, as to fill the apiarian with astonishment and almost persuade him that they are a superior kind of bee. In my own practice I have oftentimes had colonies to work with untiring diligence weeks after the labor of others had ceased. So, too, every bee keeper is cognizant of the superior thrift and industry in which a swarm newly made, whether naturally or artificially, will excel others by its side, having perhaps twice its number of bees.

I once had a swarm issue on the last day of June from a common box hive, after having doggedly refused to do so for nearly a month, the bees all this time lounging inside and out on the sides of the hive without apparently increasing the honey stores of the hive. This swarm, with about the average number of bees, was put in a frame hive of the capacity of about 2,200 cubic inches, inside measure, having a glass in the back with a blind to intercept the light and darken the chamber. In two weeks from the time this swarm was hived, such was the extraordinary rapidity with which it worked that its hive was filled to overflowing with combs and honey, and 30 boxes or sections of the capacity of one pound each, placed on top, were filled likewise. The boxes when filled were taken off and an estimate formed of the honey stored in both hive and boxes. This estimate could be made with some degree of certainty as the weight of the hives when empty had been ascertained and marked on their sides. After making the necessary deduction for bees, brood, etc., I estimated the amount of honey gathered at 80 pounds, after apportioning 50 pounds to the brood chamber, which I deemed moderate, considering its capacity. Here is the large amount of 80 pounds of honey secured by a colony of bees in two weeks while under the honey-gathering impulse excited by swarming, which impulse or propensity for gathering honey can be generated in a colony of bees at any time when there is bloom, and maintained throughout the honey season. The extraordinary industry in newly made swarms (but by no means peculiar to them) has often been remarked by bee keepers, and has given rise to much speculation as to the true cause of its development.

Among many causes assigned in explanation of this seeming mystery perhaps the most plausible is the theory which supposes the queen's age and fertility to govern the industry of the hive. But, admitting the full force of this assumption with full conviction of the advantages secured to the apiarian by the continued presence of a young and prolific queen in each and every colony, there are times and instances in which even this fails to furnish the explanation required; as, for instance, the case already cited, in which prior to the issuing of the swarm, a few bees only left for forage, while the much larger portion lounged on the sides of the hive for days feeding on the stores already garnered. If the queen's extra fertility be urged as a proper solution of the rapidity with which this swarm filled all its tenements to overflowing, we must imagine her to have suddenly acquired some new capacity for laying, else the difference of the bees in point of industry, before and after swarming, cannot be satisfactorily accounted for.

The point to be gained by the bee keeper of the present time is to ascertain, if possible, the true cause of the honey-gathering impulse in bees; the conditions necessary to its continuance throughout the season; and the most efficient means of generating and stimulating it to its fullest capacity in order to secure the largest returns. If the product of a swarm of bees incited to labor by causes in accord with their natural habits and instincts will reach the amount I before stated, in the short time of two weeks, to what amount will this increase if the honey-gathering propensity is, by judicious treatment, fostered to its fullest capacity and retained in this condition throughout a long and inviting honey yield?

Cortland Co., N. Y. J. G BINGHAM.

Scientific and Useful.

NEW JERSEY AGRICULTURAL EXPERIMENT STATION.

BULLETIN NO. 13.

Land Plaster.

A CONSIDERABLE number of samples of this old and well-tried fertilizer have been sent in for examination this year. The principal varieties in market come either from Nova Scotia or from Central New York. That from Nova Scotia is white, while that from New York State is grayish or ash-colored. From this difference in color buyers are led to fear that there may be important differences in composition. Such, however, is not the case. Of the samples examined at this Station last season, and this year also, there was none that had been fraudulently adulterated. The transparent lumps occasionally seen in unground plaster are specimens of the pure substance, gypsum or sulphate of lime. They are composed of:

Lime	32.6 per cent
Sulphuric acid	46.5 "
Water	20.9 "
	100.0

Most ground gypsum contains at least one or two per cent. of harmless impurities, and some of it contains 20 30 or more per cent. of impurities. In the plaster from New York State the impurities consist mainly of carbonates of lime and magnesia.

As the plaster is sold for the amount of pure gypsum in it, we have only determined the percentage of that substance in the samples sent to the Station.

Station No. 94—Cayuga Land Plaster; sent by John T. Cox, Readington.

Station No. 95—Nova Scotia Land Plaster; sent by John T. Cox, Readington.

Station No. 112—Nova Scotia Land Plaster sent by Frank P Haines, Camden.

Station No. 113—French's Selected Land Plaster; sent by Frank P. Haines, Camden.

Station No. 126—Nova Scotia Land Plaster; sent by D K. Craig, Somerville.

Station No. 127—Nova Scotia Land Plaster; sent by D K Craig, Somerville.

Station No. 128—Onondaga Land Plaster; sent by D K. Craig, Somerville.

Station No. 94—Contains 63 08 per cent. pure plaster; costs $6 per ton.

Station No. 95—Contains 92 78 per cent. pure plaster; costs $7 50 per ton.

Station No. 112—Contains 90 28 per cent. pure plaster; costs———

Station No. 113—Contains 98 75 per cent. pure plaster; costs $8 per ton.

Station No. 126—Contains 98 per cent. pure plaster; costs $8 50 per ton.

Station No. 127—Contains 96 52 per cent. pure plaster; costs $7.50 per ton.

Station No. 128—Contains 73 08 per cent. pure plaster; costs $6 50 per ton.

Nos. 94 and 128 contain considerable quantities of calcium carbonate.

Gypsum or plaster was much used as a fertilizer on our best farms many years ago, but its use had fallen off to a great extent, and is now again increasing. The reasons for its use are derived entirely from experience. No satisfactory explanation in regard to the theory of its action has been made. But farmers find it beneficial to sprinkle on manure and compost heaps in order to fix gases and to rot coarse manures, in preparing home-made fertilizers, and in sowing on young clover and potatoes.

Some very suggestive experiments as to the proper season for applying plaster to crops have been made by Prof. Marker, at the Experimental Station in Halle, Germany. He sowed the plaster in March and December, and while the increased crop was very satisfactory in both cases, that following the application in December was from 15 to 50 per cent. greater than that from the one in March. The particulars of his experiments are given in the annual report of this Station.

Ground Bone.

Station No. 109—Commonwealth Bone; from manufactory of Rafferty & Williams, New York.

Station No. 118—Pure Ground Bone; from manufactory of Jas. Depue & Co., Belvidere, New Jersey.

Station No. 119—Swift Sure Bone; from manufactory of M. L. Shoemaker & Co., Phila.

Station No, 120—Swift Sure Bone Meal; from manufactory of M. L. Shoemaker & Co., Philadelphia.

Station No. 132—Smith's Pure Ground Bone; from manufactory of John I. Smith, Trenton.

CHEMICAL ANALYSIS AND VALUATION.

Station Nos.	109	118	119	130	132
Nitrogen	1.20 per cent	3.53 per cent	6.25 per cent	6.36 per cent	4.59 per cent.
Total Phos. Acid	10.61 per cent.	21.16 per cent.	30.00 per cent	20 11 per cent.	22.40 per cent.
Estimated Value	$14 83	$31 51	$39 19	$41 37	$33 40
Cost	$33.50	$30.00	$32 00	$38.00	$35 00

MECHANICAL ANALYSIS.

Station Nos.	109	118	119	130	132
Fine	40.5 per cent	12.1 per cent.	35 1 per cent	32.8 per cent.	5.0 per cent
Fine Medium	8.5 per cent	33.5 per cent	38.8 per cent.	38.2 per cent.	13.0 per cent.
Medium	16.3 per cent	40.7 per cent.	14.6 per cent	9.0 per cent.	45.0 per cent.
Coarse Medium	11.7 per cent.	14.7 per cent.	11.5 per cent.	0.0 per cent.	36.0 per cent.
Coarse	3.0 per cent.	0.0 per cent	0.0 per cent	0.0 per cent.	0.0 per cent.

Ground Bone has been used by farmers longer than any other of the high-priced fertilizers, and it still holds its rank in their estimation. The chief change made in preparing it for market is in grinding it finer than was formerly done. That fine ground bone should be quicker than coarse bone in its action, and should either produce better effects or else should answer its purpose with smaller quantities is naturally to be expected, and the experience of good farmers has fully sustained this expectation. The Station prices for bone of different degrees of fineness were deduced from the market values of the various grades of ground bone.

An examination of the mechanical analysis given above, and of the valuations compared with the selling prices, shows very plainly the greater worth of the bone that is ground fine, and the loss which comes from sending it into market imperfectly ground.

GEO. H. COOK, Director.

New Brunswick, N. J., May 5, 1881.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN NO. 58. APRIL 28, 1881.

Superphosphates, Guanos.

568. Soluble nitrogenous phosphate.

567. Pine Island guano.

The samples named above were manufactured by the Quinnipiac Fertilizer Co of New London, Conn., and sold by Olds & Whipple, Hartford, Conn.

565 Soluble Pacific guano, manufactnred by the Pacific Guano Co., Boston, Mass., and sold by H. A Stillman & Co., Hartford, Conn.

561. Mitchell's standard phosphate, sold by H. A. Stillman & Co., Hartford, Conn.

	568	567	565	561
Soluble phos. acid	5 70	5 34	5 90	0 14
Reverted " "	4 61	1 93	1 36	5 08
Insoluble " "	1 16	0 52	4 05	2 19
Nitrogen	2 41	4 20	2 61	1 06
Potash	2 70	2 94	2 28	....
Chlorine	2 84	1 08	2 45	....
Estimated value per ton	$36 01	$38 65	$35 36	$16 26
Cost per ton	40 00	45 00	45 00	40 00
Cost exceeds valuation	3 99	6 35	9 64	23 64

Potash Salts.

559. Sulphate of potash, imported and sold by the Mapes' Formula and Peruvian Guano Co., New York and Hartford.

572. Muriate of potash, imported by the Bowker Fertilizer Co, Boston and New York; sold by Wilson & Burr, Middletown, Conn.; sent by J. M. Hubbard, Middletown.

	559	572
Potash (potassium oxide)	43 23	49 02
Sulphate of potash	79 95	....
Muriate of potash	....	77 63
Chlorine	0 88	....
Potash guaranteed	43 80	50 54*
Cost per ton	$65 00	$45 00
Cost per 100 pounds potash	7 52	4 59

* "Guaranteed 80-85 per cent. muriate of potash" equals 50.5-52.7 potash.

Salt, Plaster.

570. Salt, manufactured by the Onondaga Salt Co., Syracuse, N. Y., sold by Bronson & Fitzgerald, Hartford.

562. Plaster, ground by G. A. London, Berlin, Conn., sold by Olds & Whipple, Hartford.

	570	562
Chlorine	56 80	....
Sodium chloride	93 60	....
Sulphuric acid	....	44 46
Hydrated sulphate of lime	....	95 57
Carbonates, etc	....	1 93
Insoluble matters	....	2 50
Cost per ton	$10 00	$9 00
100 pounds of pure gypsum cost	....	47

Bone, Fish, Castor Pomace.

569. Pure bone meal, made and sold by the Mapes' Formula and Peruvian Guano Co., New York and Hartford.

566. Dry ground fish guano, made by the Quinnipiac Fertilizer Co., New London, sold by Olds & Whipple, Hartford.

564. Castor pomace, made by H. J. Baker & Bros., New York, sold by Olds & Whipple, Hartford.

563. Castor pomace, made by H. J. Baker & Bros., sold by Buckland & Hardin, Glastonbury, Conn.

	569	566	564	563
Nitrogen	2 46	8 54	5 47	5 08
Phos. acid	27 46	6 96	1 51	1 60
Potash	....	....	0 90	1 12
Est. value per ton	$40 33	$43 59	$20 33	$18 97
Cost per ton	42 00	45 00	25 00	25 00
Cost exceeds valuation	1 67	2 49	4 68	6 03

With the exception of 572 all the samples reported in this Bulletin were taken and sent by E C. Bunce, of South Manchester.

The bone meal 569 all passed holes of 1-50 inch.

Trade Values for 1881.

For 1881 the following revised TRADE VALUES will be employed for comparing fertilizers. These values are with two exceptions the same as given in Bulletin 52 and in the Station report of 1880. Here the prices of potash in sulphate and muriate are increased, the former one-half cent, the latter one cent per pound.

	Cts. per lb.
Nitrogen in nitrates	26
" in ammonia salts	22½
" in Peruvian Guano, fine steamed bone, dried and fine ground blood, meat and fish, superphosphates and special manures	20
" in coarse or moist blood, meat or tankage, in cotton seed, linseed and castor pomace	16
" in fine ground bone, horn and wool dust	15
" in fine medium bone	14
" in medium bone	13
" in coarse medium bone	13
" in coarse bone, horn shaving, hair and fish scrap	11
Phosphoric acid soluble in water	12½
" " "reverted" and Peruvian Guano	9
" " insoluble, in fine bone and fish guano	6
" " " in fine medium bone	5½
" " " in medium bone	5
" " " in coarse medium bone	4½
" " " in coarse bone, bone ash and bone black	4
" " " in fine ground rock phosphate	3½
Potash in high grade sulphate	7½
" in low grade sulphate and kainite	5½
" in muriate or potassium chloride	4½

There has been some advance in the cost of ammonia salts and animal matters, and, as a consequence, the selling prices of these articles and of superphosphates, etc., are often higher than last year. The Station valuations should be regarded as approximate, and while they cannot in every case fix the absolute money value of fertilizers, they may commonly be relied on for purposes of comparison.

S. W. JOHNSON, Director.

Entomological.

THE RESPLENDENT SHIELD-BEARER.
(Aspidisca splendoriferella.)

PROFESSOR G. H. FRENCH.

SOME of our comic newspapers a few years ago facetiously represented the prospect for raising a crop in some of the States west of the Mississippi, by picturing a hill of corn surrounded on three sides by a close fence, the owner sitting in the opening on the fourth side to watch the hill, while hungry grasshoppers were peering over the fence, patiently waiting for the old man to fall asleep that they might eat the corn. The idea we may get from the picture—that eternal vigilance is the price of a good crop—is true of more than one of the plants cultivated for food. Most of them have been brought from the Old World, and with them have come their insect enemies, leaving behind many of the parasites that kept these enemies in check. When we add to these the insects native of this country, that may feed upon the same plants, it is easy to see that watchfulness is necessary to successfully raise almost any of our cultivated crops. Perhaps there is no one plant among those generally cultivated of which this is more true than the apple tree. A host of caterpillars may destroy the leaves, lice may suck the juices from limbs and twigs, or the borers may riddle the trunk and branches. If the tree escapes all these, and bears fine-looking fruit, even this may be found to be pre-empted by the apple worm.

One of the smallest of the insects that feed upon the apple tree is the one named at the head of this article and represented in its various stages in the accompanying illustration. The moth is represented at *g*, larger than in nature, the true size being shown by the crossed lines between the hind pair of legs. This deposits its eggs on the upper surface of the leaves soon after they are fully expanded. Professor Comstock, Entomologist to the Department of Agriculture, in his last report gives quite a full account of the habits of the larvæ of this little moth. As soon as the egg hatches the young larva eats its way into the green pulp between the thin skins that cover the upper and lower sides of the leaf. Here it lives, feeding upon the green matter and leaving the thin films of tissue above and below until it has attained its full size and is ready to change to a pupa. Figure *b* represents the insect at this time, the mark at the side, as in other cases, representing the true length.
